"It was not the intent of the law to allow a person to make his location crosswise of a vein so that the side lines shall cross it, and thereby give him the right to follow the strike of the vein outside of his side lines. That would subvert the whole system sought to be established by the law. If he does locate his claim in that way, his rights must be subordinated to the rights of those who have properly located on the lode. Their right to follow the dip outside of their

TABLE OF CONTENTS.

ILLUSTRATIONS.—North Pole Mill, Sumpter, Oregon; Columbia Mine and Mill, Bourne, Oregon, 4. Some New Patents; W. D. Johnson, Sec'y Executive Committee International Mining Congress; Gov. H. M. Wells, Chairman Local Executive Committee International Mining Congress; John Dern, Vice-President International Mining Congress, 6.

EDITORIAL.—The Law Interpreted, 1-2-3. Some Large Gold Nuggets; Miscellaneous, 3.

MINING SUMMARY.—From the Various Counties of California, Nevada and Oregon; Pacific Coast States and Territories, 9-10-11.

TELEMARKETS.—The Local Markets; Mining Share Market; Sales in San Francisco Stock Board, 28.

MISCELLANEOUS.—Sectional Churned Rolls; Buildings in Mining Camps; Some Eastern Oregon Mines, 4. A British Columbia Enterprise; Some New Patents; Primitive Mining, 5. Our National Birthday; Liquid Hydrogen; Mining Congress Officials; Edis n as a Humorist; Liquid Chlorine; Notes on Some Supposed Nickel and Cobalt Minerals; State Maps and Register, 6. Coast Industrial Notes; Recently Declared Mining Dividends; Personal; Recent California Mining Incorporations; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents; Obituary, 7. Method of Determining Distances; "Wireless Telegraphy;" A Local Magnetic Pole; Water Inches; Will be the Largest Flag in the World; Carbolic Acid in Soudra; Something New in Telephones; Warships and Cruisers; Physical Condition of Volunteers; Unoccupied Government Land; Cast-Iron Pipes; Cryptography, 8. Index to Last Volume, 12-13. Commercial Paragraphs, 14.

side lines cannot be interfered with by him. His right to the lode only extends to so much of the lode as his claim covers. If he has located crosswise of the lode, and his claim is only one hundred feet wide, that one hundred feet is all he has a right to.

These decisions show that while the express purpose of the statute was to grant the vein for so many feet along its course, yet such grant could only be made effectively by a surface location covering the course to such extent. This Act of 1866 remained in force only six years, and was then superseded by the Act of May 10, 1872, (17 Stat. 91), found in the Revised Statutes, sections 2319 and following. This is the statute which is in force to-day, and under which the controversies in this case arise. Section 2319, Revised Statutes, (corresponding to section 1 of the Act of 1872), reads:

"All valuable mineral deposits in lands belonging to the United States, both before and after discovery, are hereby declared to be free and open to exploration and purchase, and the lands in which they are found to occupation and purchase by citizens of the United States and those who have declared their intention to become such, under regulations prescribed by law, and according to the local customs or usages of miners in several mining districts, so far as the same are applicable and not inconsistent with the law of the United States."

It needs no argument to show that if this were the only section bearing upon the question, patents for land containing mineral would, except in cases affected by local customs and rules of miners, be subject to the ordinary rules of the common law, and would convey title to only such minerals as were found beneath the surface. We therefore turn to the following sections to see what extralateral rights are given to what conditions they may be exercised, and what must be borne in mind in considering the various provisions that we are dealing simply with statutory rights. There is no showing of any local customs or rules affecting the rights defined in and prescribed by the statute, and beyond the terms of the statute courts may not go. They have no power of legislation. They cannot assume the existence of any natural equity and rule that by reason of such equity a party may follow a vein into the territory of his neighbor, and in some of the opinions asserted arise by which Congress has made no provision, the courts cannot supply the defect. Congress having prescribed the conditions upon which extralateral rights may be acquired, a party must bring himself within those conditions or else be content with simply the mineral beneath the surface of his territory. It is undoubtedly true that the primary thought of the statute is the disposal of the mines and minerals, and that the intent of the statute is to give the primary purpose must be recognized and given effect. Hence, whenever a party has acquired the title to ground within whose surface area is the apex of a vein with a few or many feet along its course or strike, a right to follow the vein on its dip for the same length ought to be awarded to him if it can be done, and only if it can be done, under any fair and natural construction of the language of the statute. If the surface of the ground was, whether level or uneven, constantly pursued a straight line there would be little difficulty in legislation to provide for all contingencies, but mineral is apt to be found in mountainous regions where great irregularity of surface exists and the course or strike of the veins is as irregular as the surface, so that many cases may arise in which statutory provisions will fail to secure to a discoverer of a vein such an amount thereof as equitably it would seem he ought to receive. We make these observations because we find in some of the opinions asserted arise by writers that they have devised rules which will work out equitable solutions of all difficulties. Perhaps those rules may have all the virtues which are claimed for them, and if so it were well if Congress could be persuaded to enact them into statute; but be that as it may, the question in the courts is not, what is equity, but what saith the statute. Thus, for instance, there is no inherent necessity that the end lines of a mining claim should be parallel, yet the statute has so specifically prescribed. See 2320. It is not within the province of the courts to ignore such provision and hold that a locator, failing to comply with its terms, has all the rights, extralateral and otherwise, which he would have been entitled to if he had complied, and so it has been adjudged. (*Iron Silver Mining Company v. Elgin Mining Company*, 118 U. S. 196.)

This case, which is often called the "Horseshoe case," on account of the form of the location, is instructive. The following diagram, which was in the record in that case, illustrates the scope of the decision: (See page 1.)

The locator claimed in his application for a patent the lines 1, 14 and 5, 6, as the end lines of his location, and because of their parallelism, that he had complied with the letter of the statute, but the court ruled against him, saying in his opinion (page 208):

"The exterior lines of the Stone claim formed a curved figure somewhat in the shape of a horseshoe, and its end lines are not and cannot be parallel. What are marked on the plat as end lines are not such. The one between numbers 1 and 14 is a side line. The draughtsman or surveyor seems to have hit upon two parallel lines of his nine-sided figure, and apparently for no other reason than their parallelism called them end lines."

"We are the more inclined to think that the objection that, by reason of the surface form of the Stone claim, the defendant could not follow the lode existing therein in its downward course beyond the lines of the claim, was well taken to the offered proof."

It is true the court also observed that if the two lines named by the locator were to be considered the end lines, no part of the vein in controversy fell "within vertical planes drawn through those lines, contained in their own direction." But notwithstanding this observation the point of the decision was that the line in question, the end lines of the location as made on the surface of the ground, were not parallel, and that this defect could not be obviated by calling that which was in fact a side line an end line. This is made more clear by the observation of the Chief Justice, who, with Mr. Justice Bradley, dissented, in which he said:

"I cannot agree to this judgment. In my opinion the end lines of a mining location are to be projected parallel to each other and crosswise of the general course of the vein within the surface limits of the location, and whenever the top or apex of the vein is found within the surface lines extended vertically downwards, the vein may be followed outside of the vertical side lines. The end lines are not necessarily those which are marked on the map as such, but they

may be projected at the extreme points where the apex leaves the location as marked on the surface."

In other words, the court took the location as made on the surface by the locator, determined from that what were the end lines, and made those surface end lines controlling upon his rights; and rejected the contention that it was proper for the court to ignore the surface location and create for the locator a new location whose end lines should be crosswise of the general course of the vein as finally determined by explorations. That this decision and that in the *Target case*, *supra*, were correct expositions of the statute and correctly comprehended the intent of Congress therein, is evident from the fact that, although they were announced in 1885 and 1878, respectively, Congress had not seen fit to change the language of the statute, or in any manner to indicate that any different measure of rights should be awarded to a mining locator.

These preliminary observations we pass to a consideration of the questions propounded. The first is:

"May any of the lines of a junior lode location be laid within, upon or across the surface of a valid senior location for the purpose of defining for or securing to such junior location underground or extralateral rights not in conflict with any rights of the senior locator?"

By section 2319, quoted above, the mineral deposits which are declared to be open to exploration and purchase are those found in lands belonging to the United States, and such lands are the only ones open to occupation and purchase. While this is true, it is also true that until the legal title has passed the public lands are within the jurisdiction of the Land Department, and although equitable rights may be established Congress retains a certain measure of control. (*Michigan Land & Lumber Company v. Rust*, 168 U. S. 589.) The grant is, as is often said, in process of administration. Passing to section 2320, beyond the recognition of the governing force of custom and regulations, and a variation as to the extreme length and width of a mining claim, it is provided that "no location of a mining claim shall be made until the discovery of the vein or lode within the limits of the claim located." The end lines of each claim shall be parallel to each other."

Section 2321 gives to the locators of all mining locations, so long as they comply with the laws of the United States, and with State, territorial or local laws not in conflict therewith, "the exclusive right of possession and enjoyment of all the surface included within the lines of their locations, and of all veins, lodes, and ledges throughout their entire depth, the top or apex of which lies inside of such surface lines extended downward vertically, although such veins, lodes, or ledges may so far depart from a perpendicular in their course downward as to extend outside the vertical side lines of such surface claim." But their right of possession is to such outside parts of surface claim, or ledges, may be confined to such portions thereof as lie between vertical planes drawn downward as above described, through the end lines of their locations, so continued in their own direction that such planes will intersect such exterior parts of such veins or ledges. And nothing in this section shall authorize the locator or possessor of a vein or lode which extends in its downward course beyond the vertical lines of his claim to enter upon the surface of a claim owned or possessed by another."

Section 2324 in terms authorizes "the miners of each mining district to make regulations, not in conflict with the laws of the United States, or with the laws of the State or Territory in which the district is situated, governing the location, manner of recording, amount of work necessary to hold possession of a mining claim, subject to the following requirements: The location must be distinctly marked on the ground so that its boundaries can be readily traced. All records of mining claims hereafter made shall contain the name or names of the locators, the date of location, and such other particulars as the claim or claims located by reference to some natural object or permanent monument as will identify the claim. On each claim located after the tenth day of May, eighteen hundred and seventy-two, and until a patent has been issued therefor, not less than one hundred dollars' worth of labor shall be performed or improvements made during each year. On all claims located prior to the tenth day of May, eighteen hundred and seventy-two, ten dollars' worth of labor shall be performed or improvements made on the tenth day of June, eighteen hundred and seventy-four, and each year thereafter, for each one hundred feet in length along the vein until a patent has been issued therefor; but where such claims are held in common, such expenditure may be made upon any one claim; and upon a failure to comply with these conditions the claim or mine upon which such failure occurred shall be open to relocation in the same manner as shall be a copy of the notice in any one of the following: The register of the land office, upon the filing of such application, plat, field notes, notices, and affidavits, shall publish a notice that such application has been made for the period of sixty days in a newspaper to be by him designated as published nearest to such claim; and he shall also post such notice in his office for the same period. The claimant, at the time of filing this application, or at any time thereafter, within the sixty days of publication, shall file with the register a certificate of the United States Surveyor-General, showing accurately the boundaries of the claim or claims located, and the value of the improvements made, and shall also post a copy of such plat, together with a notice of such application for a patent, in a conspicuous place on the land embraced in such plat previous to the filing of the application for a patent, and shall file an affidavit of at least two persons that such notice has been duly posted, and shall file a copy of the notice in any one of the following: The register of the land office, upon the filing of such application, plat, field notes, notices, and affidavits, shall publish a notice that such application has been made for the period of sixty days in a newspaper to be by him designated as published nearest to such claim; and he shall also post such notice in his office for the same period. The claimant, at the time of filing this application, or at any time thereafter, within the sixty days of publication, shall file with the register a certificate of the United States Surveyor-General, showing accurately the boundaries of the claim or claims located, and the value of the improvements made, and shall also post a copy of such plat, together with a notice of such application for a patent, in a conspicuous place on the land embraced in such plat previous to the filing of the application for a patent, and shall file an affidavit of at least two persons that such notice has been duly posted, and shall file a copy of the notice in any one of the following: The register of the land office, upon the filing of such application, plat, field notes, notices, and affidavits, shall publish a notice that such application has been made for the period of sixty days in a newspaper to be by him designated as published nearest to such claim; and he shall also post such notice in his office for the same period. The claimant, at the time of filing this application, or at any time thereafter, within the sixty days of publication, shall file with the register a certificate of the United States Surveyor-General, showing accurately the boundaries of the claim or claims located, and the value of the improvements made, and shall also post a copy of such plat, together with a notice of such application for a patent, in a conspicuous place on the land embraced in such plat previous to the filing of the application for a patent, and shall file an affidavit of at least two persons that such notice has been duly posted, and shall file a copy of the notice in any one of the following: The register of the land office, upon the filing of such application, plat, field notes, notices, and affidavits, shall publish a notice that such application has been made for the period of sixty days in a newspaper to be by him designated as published nearest to such claim; and he shall also post such notice in his office for the same period. The claimant, at the time of filing this application, or at any time thereafter, within the sixty days of publication, shall file with the register a certificate of the United States Surveyor-General, showing accurately the boundaries of the claim or claims located, and the value of the improvements made, and shall also post a copy of such plat, together with a notice of such application for a patent, in a conspicuous place on the land embraced in such plat previous to the filing of the application for a patent, and shall file an affidavit of at least two persons that such notice has been duly posted, and shall file a copy of the notice in any one of the following: The register of the land office, upon the filing of such application, plat, field notes, notices, and affidavits, shall publish a notice that such application has been made for the period of sixty days in a newspaper to be by him designated as published nearest to such claim; and he shall also post such notice in his office for the same period. The claimant, at the time of filing this application, or at any time thereafter, within the sixty days of publication, shall file with the register a certificate of the United States Surveyor-General, showing accurately the boundaries of the claim or claims located, and the value of the improvements made, and shall also post a copy of such plat, together with a notice of such application for a patent, in a conspicuous place on the land embraced in such plat previous to the filing of the application for a patent, and shall file an affidavit of at least two persons that such notice has been duly posted, and shall file a copy of the notice in any one of the following: The register of the land office, upon the filing of such application, plat, field notes, notices, and affidavits, shall publish a notice that such application has been made for the period of sixty days in a newspaper to be by him designated as published nearest to such claim; and he shall also post such notice in his office for the same period. The claimant, at the time of filing this application, or at any time thereafter, within the sixty days of publication, shall file with the register a certificate of the United States Surveyor-General, showing accurately the boundaries of the claim or claims located, and the value of the improvements made, and shall also post a copy of such plat, together with a notice of such application for a patent, in a conspicuous place on the land embraced in such plat previous to the filing of the application for a patent, and shall file an affidavit of at least two persons that such notice has been duly posted, and shall file a copy of the notice in any one of the following: The register of the land office, upon the filing of such application, plat, field notes, notices, and affidavits, shall publish a notice that such application has been made for the period of sixty days in a newspaper to be by him designated as published nearest to such claim; and he shall also post such notice in his office for the same period. The claimant, at the time of filing this application, or at any time thereafter, within the sixty days of publication, shall file with the register a certificate of the United States Surveyor-General, showing accurately the boundaries of the claim or claims located, and the value of the improvements made, and shall also post a copy of such plat, together with a notice of such application for a patent, in a conspicuous place on the land embraced in such plat previous to the filing of the application for a patent, and shall file an affidavit of at least two persons that such notice has been duly posted, and shall file a copy of the notice in any one of the following: The register of the land office, upon the filing of such application, plat, field notes, notices, and affidavits, shall publish a notice that such application has been made for the period of sixty days in a newspaper to be by him designated as published nearest to such claim; and he shall also post such notice in his office for the same period. The claimant, at the time of filing this application, or at any time thereafter, within the sixty days of publication, shall file with the register a certificate of the United States Surveyor-General, showing accurately the boundaries of the claim or claims located, and the value of the improvements made, and shall also post a copy of such plat, together with a notice of such application for a patent, in a conspicuous place on the land embraced in such plat previous to the filing of the application for a patent, and shall file an affidavit of at least two persons that such notice has been duly posted, and shall file a copy of the notice in any one of the following: The register of the land office, upon the filing of such application, plat, field notes, notices, and affidavits, shall publish a notice that such application has been made for the period of sixty days in a newspaper to be by him designated as published nearest to such claim; and he shall also post such notice in his office for the same period. The claimant, at the time of filing this application, or at any time thereafter, within the sixty days of publication, shall file with the register a certificate of the United States Surveyor-General, showing accurately the boundaries of the claim or claims located, and the value of the improvements made, and shall also post a copy of such plat, together with a notice of such application for a patent, in a conspicuous place on the land embraced in such plat previous to the filing of the application for a patent, and shall file an affidavit of at least two persons that such notice has been duly posted, and shall file a copy of the notice in any one of the following: The register of the land office, upon the filing of such application, plat, field notes, notices, and affidavits, shall publish a notice that such application has been made for the period of sixty days in a newspaper to be by him designated as published nearest to such claim; and he shall also post such notice in his office for the same period. The claimant, at the time of filing this application, or at any time thereafter, within the sixty days of publication, shall file with the register a certificate of the United States Surveyor-General, showing accurately the boundaries of the claim or claims located, and the value of the improvements made, and shall also post a copy of such plat, together with a notice of such application for a patent, in a conspicuous place on the land embraced in such plat previous to the filing of the application for a patent, and shall file an affidavit of at least two persons that such notice has been duly posted, and shall file a copy of the notice in any one of the following: The register of the land office, upon the filing of such application, plat, field notes, notices, and affidavits, shall publish a notice that such application has been made for the period of sixty days in a newspaper to be by him designated as published nearest to such claim; and he shall also post such notice in his office for the same period. The claimant, at the time of filing this application, or at any time thereafter, within the sixty days of publication, shall file with the register a certificate of the United States Surveyor-General, showing accurately the boundaries of the claim or claims located, and the value of the improvements made, and shall also post a copy of such plat, together with a notice of such application for a patent, in a conspicuous place on the land embraced in such plat previous to the filing of the application for a patent, and shall file an affidavit of at least two persons that such notice has been duly posted, and shall file a copy of the notice in any one of the following: The register of the land office, upon the filing of such application, plat, field notes, notices, and affidavits, shall publish a notice that such application has been made for the period of sixty days in a newspaper to be by him designated as published nearest to such claim; and he shall also post such notice in his office for the same period. The claimant, at the time of filing this application, or at any time thereafter, within the sixty days of publication, shall file with the register a certificate of the United States Surveyor-General, showing accurately the boundaries of the claim or claims located, and the value of the improvements made, and shall also post a copy of such plat, together with a notice of such application for a patent, in a conspicuous place on the land embraced in such plat previous to the filing of the application for a patent, and shall file an affidavit of at least two persons that such notice has been duly posted, and shall file a copy of the notice in any one of the following: The register of the land office, upon the filing of such application, plat, field notes, notices, and affidavits, shall publish a notice that such application has been made for the period of sixty days in a newspaper to be by him designated as published nearest to such claim; and he shall also post such notice in his office for the same period. The claimant, at the time of filing this application, or at any time thereafter, within the sixty days of publication, shall file with the register a certificate of the United States Surveyor-General, showing accurately the boundaries of the claim or claims located, and the value of the improvements made, and shall also post a copy of such plat, together with a notice of such application for a patent, in a conspicuous place on the land embraced in such plat previous to the filing of the application for a patent, and shall file an affidavit of at least two persons that such notice has been duly posted, and shall file a copy of the notice in any one of the following: The register of the land office, upon the filing of such application, plat, field notes, notices, and affidavits, shall publish a notice that such application has been made for the period of sixty days in a newspaper to be by him designated as published nearest to such claim; and he shall also post such notice in his office for the same period. The claimant, at the time of filing this application, or at any time thereafter, within the sixty days of publication, shall file with the register a certificate of the United States Surveyor-General, showing accurately the boundaries of the claim or claims located, and the value of the improvements made, and shall also post a copy of such plat, together with a notice of such application for a patent, in a conspicuous place on the land embraced in such plat previous to the filing of the application for a patent, and shall file an affidavit of at least two persons that such notice has been duly posted, and shall file a copy of the notice in any one of the following: The register of the land office, upon the filing of such application, plat, field notes, notices, and affidavits, shall publish a notice that such application has been made for the period of sixty days in a newspaper to be by him designated as published nearest to such claim; and he shall also post such notice in his office for the same period. The claimant, at the time of filing this application, or at any time thereafter, within the sixty days of publication, shall file with the register a certificate of the United States Surveyor-General, showing accurately the boundaries of the claim or claims located, and the value of the improvements made, and shall also post a copy of such plat, together with a notice of such application for a patent, in a conspicuous place on the land embraced in such plat previous to the filing of the application for a patent, and shall file an affidavit of at least two persons that such notice has been duly posted, and shall file a copy of the notice in any one of the following: The register of the land office, upon the filing of such application, plat, field notes, notices, and affidavits, shall publish a notice that such application has been made for the period of sixty days in a newspaper to be by him designated as published nearest to such claim; and he shall also post such notice in his office for the same period. The claimant, at the time of filing this application, or at any time thereafter, within the sixty days of publication, shall file with the register a certificate of the United States Surveyor-General, showing accurately the boundaries of the claim or claims located, and the value of the improvements made, and shall also post a copy of such plat, together with a notice of such application for a patent, in a conspicuous place on the land embraced in such plat previous to the filing of the application for a patent, and shall file an affidavit of at least two persons that such notice has been duly posted, and shall file a copy of the notice in any one of the following: The register of the land office, upon the filing of such application, plat, field notes, notices, and affidavits, shall publish a notice that such application has been made for the period of sixty days in a newspaper to be by him designated as published nearest to such claim; and he shall also post such notice in his office for the same period. The claimant, at the time of filing this application, or at any time thereafter, within the sixty days of publication, shall file with the register a certificate of the United States Surveyor-General, showing accurately the boundaries of the claim or claims located, and the value of the improvements made, and shall also post a copy of such plat, together with a notice of such application for a patent, in a conspicuous place on the land embraced in such plat previous to the filing of the application for a patent, and shall file an affidavit of at least two persons that such notice has been duly posted, and shall file a copy of the notice in any one of the following: The register of the land office, upon the filing of such application, plat, field notes, notices, and affidavits, shall publish a notice that such application has been made for the period of sixty days in a newspaper to be by him designated as published nearest to such claim; and he shall also post such notice in his office for the same period. The claimant, at the time of filing this application, or at any time thereafter, within the sixty days of publication, shall file with the register a certificate of the United States Surveyor-General, showing accurately the boundaries of the claim or claims located, and the value of the improvements made, and shall also post a copy of such plat, together with a notice of such application for a patent, in a conspicuous place on the land embraced in such plat previous to the filing of the application for a patent, and shall file an affidavit of at least two persons that such notice has been duly posted, and shall file a copy of the notice in any one of the following: The register of the land office, upon the filing of such application, plat, field notes, notices, and affidavits, shall publish a notice that such application has been made for the period of sixty days in a newspaper to be by him designated as published nearest to such claim; and he shall also post such notice in his office for the same period. The claimant, at the time of filing this application, or at any time thereafter, within the sixty days of publication, shall file with the register a certificate of the United States Surveyor-General, showing accurately the boundaries of the claim or claims located, and the value of the improvements made, and shall also post a copy of such plat, together with a notice of such application for a patent, in a conspicuous place on the land embraced in such plat previous to the filing of the application for a patent, and shall file an affidavit of at least two persons that such notice has been duly posted, and shall file a copy of the notice in any one of the following: The register of the land office, upon the filing of such application, plat, field notes, notices, and affidavits, shall publish a notice that such application has been made for the period of sixty days in a newspaper to be by him designated as published nearest to such claim; and he shall also post such notice in his office for the same period. The claimant, at the time of filing this application, or at any time thereafter, within the sixty days of publication, shall file with the register a certificate of the United States Surveyor-General, showing accurately the boundaries of the claim or claims located, and the value of the improvements made, and shall also post a copy of such plat, together with a notice of such application for a patent, in a conspicuous place on the land embraced in such plat previous to the filing of the application for a patent, and shall file an affidavit of at least two persons that such notice has been duly posted, and shall file a copy of the notice in any one of the following: The register of the land office, upon the filing of such application, plat, field notes, notices, and affidavits, shall publish a notice that such application has been made for the period of sixty days in a newspaper to be by him designated as published nearest to such claim; and he shall also post such notice in his office for the same period. The claimant, at the time of filing this application, or at any time thereafter, within the sixty days of publication, shall file with the register a certificate of the United States Surveyor-General, showing accurately the boundaries of the claim or claims located, and the value of the improvements made, and shall also post a copy of such plat, together with a notice of such application for a patent, in a conspicuous place on the land embraced in such plat previous to the filing of the application for a patent, and shall file an affidavit of at least two persons that such notice has been duly posted, and shall file a copy of the notice in any one of the following: The register of the land office, upon the filing of such application, plat, field notes, notices, and affidavits, shall publish a notice that such application has been made for the period of sixty days in a newspaper to be by him designated as published nearest to such claim; and he shall also post such notice in his office for the same period. The claimant, at the time of filing this application, or at any time thereafter, within the sixty days of publication, shall file with the register a certificate of the United States Surveyor-General, showing accurately the boundaries of the claim or claims located, and the value of the improvements made, and shall also post a copy of such plat, together with a notice of such application for a patent, in a conspicuous place on the land embraced in such plat previous to the filing of the application for a patent, and shall file an affidavit of at least two persons that such notice has been duly posted, and shall file a copy of the notice in any one of the following: The register of the land office, upon the filing of such application, plat, field notes, notices, and affidavits, shall publish a notice that such application has been made for the period of sixty days in a newspaper to be by him designated as published nearest to such claim; and he shall also post such notice in his office for the same period. The claimant, at the time of filing this application, or at any time thereafter, within the sixty days of publication, shall file with the register a certificate of the United States Surveyor-General, showing accurately the boundaries of the claim or claims located, and the value of the improvements made, and shall also post a copy of such plat, together with a notice of such application for a patent, in a conspicuous place on the land embraced in such plat previous to the filing of the application for a patent, and shall file an affidavit of at least two persons that such notice has been duly posted, and shall file a copy of the notice in any one of the following: The register of the land office, upon the filing of such application, plat, field notes, notices, and affidavits, shall publish a notice that such application has been made for the period of sixty days in a newspaper to be by him designated as published nearest to such claim; and he shall also post such notice in his office for the same period. The claimant, at the time of filing this application, or at any time thereafter, within the sixty days of publication, shall file with the register a certificate of the United States Surveyor-General, showing accurately the boundaries of the claim or claims located, and the value of the improvements made, and shall also post a copy of such plat, together with a notice of such application for a patent, in a conspicuous place on the land embraced in such plat previous to the filing of the application for a patent, and shall file an affidavit of at least two persons that such notice has been duly posted, and shall file a copy of the notice in any one of the following: The register of the land office, upon the filing of such application, plat, field notes, notices, and affidavits, shall publish a notice that such application has been made for the period of sixty days in a newspaper to be by him designated as published nearest to such claim; and he shall also post such notice in his office for the same period. The claimant, at the time of filing this application, or at any time thereafter, within the sixty days of publication, shall file with the register a certificate of the United States Surveyor-General, showing accurately the boundaries of the claim or claims located, and the value of the improvements made, and shall also post a copy of such plat, together with a notice of such application for a patent, in a conspicuous place on the land embraced in such plat previous to the filing of the application for a patent, and shall file an affidavit of at least two persons that such notice has been duly posted, and shall file a copy of the notice in any one of the following: The register of the land office, upon the filing of such application, plat, field notes, notices, and affidavits, shall publish a notice that such application has been made for the period of sixty days in a newspaper to be by him designated as published nearest to such claim; and he shall also post such notice in his office for the same period. The claimant, at the time of filing this application, or at any time thereafter, within the sixty days of publication, shall file with the register a certificate of the United States Surveyor-General, showing accurately the boundaries of the claim or claims located, and the value of the improvements made, and shall also post a copy of such plat, together with a notice of such application for a patent, in a conspicuous place on the land embraced in such plat previous to the filing of the application for a patent, and shall file an affidavit of at least two persons that such notice has been duly posted, and shall file a copy of the notice in any one of the following: The register of the land office, upon the filing of such application, plat, field notes, notices, and affidavits, shall publish a notice that such application has been made for the period of sixty days in a newspaper to be by him designated as published nearest to such claim; and he shall also post such notice in his office for the same period. The claimant, at the time of filing this application, or at any time thereafter, within the sixty days of publication, shall file with the register a certificate of the United States Surveyor-General, showing accurately the boundaries of the claim or claims located, and the value of the improvements made, and shall also post a copy of such plat, together with a notice of such application for a patent, in a conspicuous place on the land embraced in such plat previous to the filing of the application for a patent, and shall file an affidavit of at least two persons that such notice has been duly posted, and shall file a copy of the notice in any one of the following: The register of the land office, upon the filing of such application, plat, field notes, notices, and affidavits, shall publish a notice that such application has been made for the period of sixty days in a newspaper to be by him designated as published nearest to such claim; and he shall also post such notice in his office for the same period. The claimant, at the time of filing this application, or at any time thereafter, within the sixty days of publication, shall file with the register a certificate of the United States Surveyor-General, showing accurately the boundaries of the claim or claims located, and the value of the improvements made, and shall also post a copy of such plat, together with a notice of such application for a patent, in a conspicuous place on the land embraced in such plat previous to the filing of the application for a patent, and shall file an affidavit of at least two persons that such notice has been duly posted, and shall file a copy of the notice in any one of the following: The register of the land office, upon the filing of such application, plat, field notes, notices, and affidavits, shall publish a notice that such application has been made for the period of sixty days in a newspaper to be by him designated as published nearest to such claim; and he shall also post such notice in his office for the same period. The claimant, at the time of filing this application, or at any time thereafter, within the sixty days of publication, shall file with the register a certificate of the United States Surveyor-General, showing accurately the boundaries of the claim or claims located, and the value of the improvements made, and shall also post a copy of such plat, together with a notice of such application for a patent, in a conspicuous place on the land embraced in such plat previous to the filing of the application for a patent, and shall file an affidavit of at least two persons that such notice has been duly posted, and shall file a copy of the notice in any one of the following: The register of the land office, upon the filing of such application, plat, field notes, notices, and affidavits, shall publish a notice that such application has been made for the period of sixty days in a newspaper to be by him designated as published nearest to such claim; and he shall also post such notice in his office for the same period. The claimant, at the time of filing this application, or at any time thereafter, within the sixty days of publication, shall file with the register a certificate of the United States Surveyor-General, showing accurately the boundaries of the claim or claims located, and the value of the improvements made, and shall also post a copy of such plat, together with a notice of such application for a patent, in a conspicuous place on the land embraced in such plat previous to the filing of the application for a patent, and shall file an affidavit of at least two persons that such notice has been duly posted, and shall file a copy of the notice in any one of the following: The register of the land office, upon the filing of such application, plat, field notes, notices, and affidavits, shall publish a notice that such application has been made for the period of sixty days in a newspaper to be by him designated as published nearest to such claim; and he shall also post such notice in his office for the same period. The claimant, at the time of filing this application, or at any time thereafter, within the sixty days of publication, shall file with the register a certificate of the United States Surveyor-General, showing accurately the boundaries of the claim or claims located, and the value of the improvements made, and shall also post a copy of such plat, together with a notice of such application for a patent, in a conspicuous place on the land embraced in such plat previous to the filing of the application for a patent, and shall file an affidavit of at least two persons that such notice has been duly posted, and shall file a copy of the notice in any one of the following: The register of the land office, upon the filing of such application, plat, field notes, notices, and affidavits, shall publish a notice that such application has been made for the period of sixty days in a newspaper to be by him designated as published nearest to such claim; and he shall also post such notice in his office for the same period. The claimant, at the time of filing this application, or at any time thereafter, within the sixty days of publication, shall file with the register a certificate of the United States Surveyor-General, showing accurately the boundaries of the claim or claims located, and the value of the improvements made, and shall also post a copy of such plat, together with a notice of such application for a patent, in a conspicuous place on the land embraced in such plat previous to the filing of the application for a patent, and shall file an affidavit of at least two persons that such notice has been duly posted, and shall file a copy of the notice in any one of the following: The register of the land office, upon the filing of such application, plat, field notes, notices, and affidavits, shall publish a notice that such application has been made for the period of sixty days in a newspaper to be by him designated as published nearest to such claim; and he shall also post such notice in his office for the same period. The claimant, at the time of filing this application, or at any time thereafter, within the sixty days of publication, shall file with the register a certificate of the United States Surveyor-General, showing accurately the boundaries of the claim or claims located, and the value of the improvements made, and shall also post a copy of such plat, together with a notice of such application for a patent, in a conspicuous place on the land embraced in such plat previous to the filing of the application for a patent, and shall file an affidavit of at least two persons that such notice has been duly posted, and shall file a copy of the notice in any one of the following: The register of the land office, upon the filing of such application, plat, field notes, notices, and affidavits, shall publish a notice that such application has been made for the period of sixty days in a newspaper to be by him designated as published nearest to such claim; and he shall also post such notice in his office for the same period. The claimant, at the time of filing this application, or at any time thereafter, within the sixty days of publication, shall file with the register a certificate of the United States Surveyor-General, showing accurately the boundaries of the claim or claims located, and the value of the improvements made, and shall also post a copy of such plat, together with a notice of such application for a patent, in a conspicuous place on the land embraced in such plat previous to the filing of the application for a patent, and shall file an affidavit of at least two persons that such notice has been duly posted, and shall file a copy of the notice in any one of the following: The register of the land office, upon the filing of such application, plat, field notes, notices, and affidavits, shall publish a notice that such application has been made for the period of sixty days in a newspaper to be by him designated as published nearest to such claim; and he shall also post such notice in his office for the same period. The claimant, at the time of filing this application, or at any time thereafter, within the sixty days of publication, shall file with the register a certificate of the United States Surveyor-General, showing accurately the boundaries of the claim or claims located, and the value of the improvements made, and shall also post a copy of such plat, together with a notice of such application for a patent, in a conspicuous place on the land embraced in such plat previous to the filing of the application for a patent, and shall file an affidavit of at least two persons that such notice has been duly posted, and shall file a copy of the notice in any one of the following: The register of the land office, upon the filing of such application, plat, field notes, notices, and affidavits, shall publish a notice that such application has been made for the period of sixty days in a newspaper to be by him designated as published nearest to such claim; and he shall also post such notice in his office for the same period. The claimant, at the time of filing this application, or at any time thereafter, within the sixty days of publication, shall file with the register a certificate of the United States Surveyor-General, showing accurately the boundaries of the claim or claims located, and the value of the improvements made, and shall also post a copy of such plat, together with a notice of such application for a patent, in a conspicuous place on the land embraced in such plat previous to the filing of the application for a patent, and shall file an affidavit of at least two persons that such notice has been duly posted, and shall file a copy of the notice in any one of the following: The register of the land office, upon the filing of such application, plat, field notes, notices, and affidavits, shall publish a notice that such application has been made for the period of sixty days in a newspaper to be by him designated as published nearest to such claim; and he shall also post such notice in his office for the same period. The claimant, at the time of filing this application, or at any time thereafter, within the sixty days of publication, shall file with the register a certificate of the United States Surveyor-General, showing accurately the boundaries of the claim or claims located, and the value of the improvements made, and shall also post a copy of such plat, together with a notice of such application for a patent, in a conspicuous place on the land embraced in such plat previous to the filing of the application for a patent, and shall file an affidavit of at least two persons that such notice has been duly posted, and shall file a copy of the notice in any one of the following: The register of the land office, upon the filing of such application, plat, field notes, notices, and affidavits, shall publish a notice that such application has been made for the period of sixty days in a newspaper to be by him designated as published nearest to such claim; and he shall also post such notice in his office for the same period. The claimant, at the time of filing this application, or at any time thereafter, within the sixty days of publication, shall file with the register a certificate of the United States Surveyor-General, showing accurately the boundaries of the claim or claims located, and the value of the improvements made, and shall also post a copy of such plat, together with a notice of such application for a patent, in a conspicuous place on the land embraced in such plat previous to the filing of the application for a patent, and shall file an affidavit of at least two persons that such notice has been duly posted, and shall file a copy of the notice in any one of the following: The register of the land office, upon the filing of such application, plat, field notes, notices, and affidavits, shall publish a notice that such application has been made for the period of sixty days in a newspaper to be by him designated as published nearest to such claim; and he shall also post such notice in his office for the same period. The claimant, at the time of filing this application, or at any time thereafter, within the sixty days of publication, shall file with the register a certificate of the United States Surveyor-General, showing accurately the boundaries of the claim or claims located, and the value of the improvements made, and shall also post a copy of such plat, together with a notice of such application for a patent, in a conspicuous place on the land embraced in such plat previous to the filing of the application for a patent, and shall file an affidavit of at least two persons that such notice has been duly posted, and shall file a copy of the notice in any one of the following: The register of the land office, upon the filing of such application, plat, field notes, notices, and affidavits, shall publish a notice that such application has been made for the period of sixty days in a newspaper to be by him designated as published nearest to such claim; and he shall also post such notice in his office for the same period. The claimant, at the time of filing this application, or at any time thereafter, within the sixty days of publication, shall file with the register a certificate of the United States Surveyor-General, showing accurately the boundaries of the claim or claims located, and the value of the improvements made, and shall also post a copy of such plat, together with a notice of such application for a patent, in a conspicuous place on the land embraced in such plat previous to the filing of the application for a patent, and shall file an affidavit of at least two persons that such notice has been duly posted, and shall file a copy of the notice in any one of the following: The register of the land office, upon the filing of such application, plat, field notes, notices, and affidavits, shall publish a notice that such application has been made for the period of sixty days in a newspaper to be by him designated as published

Sectional Cushioned Rolls.

At the last meeting of the American Institute of Mining Engineers, J. W. Pinder of Elko, Nevada, presented the subject of sectional cushioned rolls, citing the common experience of millmen handling crushing rolls, viz: that in ordinary practice, when fine product is desired, the ore materials delivered to the machine, divided into four sizes, may be estimated, approximately, as follows: Passing a 4-mesh screen, 40%; passing a 2-mesh screen, 30%; passing a 1-inch-mesh screen, 20%; larger, 10%. This estimate refers more particularly to the requirements of medium-sized rolls and fine crushing. But, depending largely on the character of work to be performed, the coarser material is often larger and of a greater percentage, while the bulk is always more or less fine.

As the common Cornish or other crushing rolls are now operated in ordinary plants, it is almost impossible, economically, to regulate the first operation of preparing the ores for the rolls so that any approach to a uniform size may be obtained. Owing to this unevenness in size it is always necessary to pass and re-pass the same material several times through the machine in order to make a successful operation.

As the ore is fed into the rolls, when the larger pieces are clutched, and the pressure begins to bear upon them, the first strain on the springs tends to separate the rolls until the crushing point, or point of greatest resistance, is reached before the pieces are actually crushed. In this way, especially in crushing hard ores, the rolls are forced apart as much as 60% to 80% of the time. This parting is not infrequently as much as half an inch and more.

By far the greater part of the material, says Mr. Pinder, being fine when it reaches the machine, has a tendency to pass through the rolls when thus opened by the larger pieces, and so to escape the desired grinding. The same may be said of coarser work, the relative proportion of sizes being the same.

To approximately correct this defect, and increase the efficiency in crushing the finer material that would otherwise pass the rolls, he has devised and practically tested a sectional cushioned system of rolls, applicable as well to all mills using rolls or rollers as a means of crushing and grinding ores of all kinds.

The system, as applied to the Cornish, or ordinary rolls of that class, consists in the division of one of the two rolls in several sections (four, six or eight), and the introduction of a stiff rubber cushion for each section, fitting snugly into the bore of the hub, and closely around the shaft which passes through it. This cushion is made of stiff car-spring rubber, from $\frac{1}{4}$ inch to 1 inch thick, according to the size of the machine.

This sectional roll receives impulse from two steel arms, one on each side, keyed to the shaft, each arm passing through and pressing against the spokes of one-half of the section.

In every other respect the machine remains the same as usual, except that the main springs should be stiffer. In the operation of this system he argues that when the larger and harder pieces of ore fall into the rolls, and the strain on the springs in the act of crushing causes the rolls to part, only that section in contact with such a piece will be parted until the necessary crushing pressure is reached, after which it will spring back into place, while all the other sections will continue to crush such finer material as may fall in contact with each, which might otherwise pass between solid rolls without crushing. He adds: "Experiment has already proved more than 30% increased results. When larger rolls are used, and coarser product is desired, the cushioned rolls, of course, may be set to crush to any size. With broader face to the rolls, and an even, well-distributed feed, the increase in capacity is very great."

Buildings in Mining Camps.

Editor Goodwin of the Salt Lake *Tribune* wonders if there will ever be a mining camp that will not from the first be a fire trap. "Of course, you have to go up a ravine to find a mine. Who ever saw a mine that was not at the head of a ravine? Well, as the opening of the mine begins, the building of the houses on either side of the ravine likewise begins. The general course of the ravine is generally in line with the direction of the prevailing wind. Always, too, when a fire breaks out it is up toward the head of the ravine and the wind is always blowing down, so that there is no chance for anything to be saved. We believe that miners should make a law among themselves that at short distances fire breaks of earth should be thrown up. The houses are mostly one-story. It would not be much to, say every twenty rods, throw up a bank of dirt say 10 feet thick at the base and as high as a one-story house, from the street back each way, to the depth of the buildings. These, supplemented by a primitive fire brigade, would stop a fire. But it is never done. In no other way do men seem to place so implicit a trust in Providence as when they build houses in a mining camp. In that respect, too, nothing ever seems to be learned by experience."

Some Eastern Oregon Mines.

The Sumpter Valley Railroad runs from Baker City to the town of Sumpter, thirty miles distant. The latter is the outfitting point for several mining districts from twelve to twenty miles away. At Bourne, twelve miles from Sumpter, are the North Pole, Eureka & Excelsior, Columbia, Golconda, Ohio and California mines. Granite, fourteen miles in another direction from Sumpter, is a staging center, from which there are routes to the La Bellevue, Grant's placers, Red Boy, Robinsonville, Bonanza and Clifford, and other mines and villages farther

which dips slightly, is between a quartzite foot wall and a slate hanging wall, and varies in width from 30 to 75 feet. The ore near the walls is high-grade, running about \$75 per ton, while the interior vein matter is lower, running about \$18 per ton. Near the surface is a decomposed quartz, bearing considerable free gold, but at greater depth the ores take the form of iron sulphides and make it more of a concentrating proposition. On each level a large amount of ore is blocked out, giving assurances of continuous production in the future. The mine and mill are connected by tram cars, the trackage being under cover. The mill has ten stamps, with amal-

NORTH POLE MILL, SUMPTER, OREGON.

away. This section throughout is mountainous, well watered and heavily timbered.

The Eureka & Excelsior, which was worked for some time under lease to Longmaid & Son, is now in charge of its owners. Its main workings are from a double compartment shaft 320 feet deep, with levels at 100-foot stations, aggregating 3100 feet. The work of stoping is now in progress between the sec-

gam plates, and six concentrators; also canvas tables for handling tailings.

The North Pole mine and mill belong to the Eastern Oregon Mining Co., Emil Melzer being resident manager. The mine is opened and being developed through two main tunnels, which cut the vein at from 1000 to 1200 feet. According to a local newspaper, the ore being produced averages \$16 per ton.

COLUMBIA MINE AND MILL, BOURNE, OREGON.

ond and third levels. Besides these workings, an adit level runs in 1700 feet. The product is an arsenical pyrites, with no free gold, the values running about \$9 per ton. Near the mine is the company's 20-stamp concentration mill, run most of the time with water power. The concentrates are shipped to the smelters.

The Columbia is a well equipped property and is steadily operating. It is owned by the Columbia Gold Mining Co., composed of Eastern people, with Frank S. Baillie as managing director. R. J. Eakman is mine superintendent and F. H. Nettleton is in charge of the mill. The mine is developed by three tunnels, which go in on the ledge, aggregating 3000 feet, and a shaft at the lower tunnel, which sinks 225 feet on the vein. These workings give a depth of 650 feet on the vein, as the three tunnels, one above the other, are connected. The ledge,

The reduction plant comprises well-equipped cyanide works, an illustration of which is herewith given.

The Golconda is a prospect which is being developed, and, if tests are satisfactory, will be equipped with a chlorine-bromine treatment mill.

La Bellevue mine, ten miles from Granite, is on Cabell mountain. It was located in 1877 by W. F. Cabell and by him partially developed. It contains two parallel veins, in a gneiss formation, the ore being an iron pyrites in a quartz gangue, and carries about equal proportions of gold and silver. It also contains some ruby and native silver, grey copper and copper pyrites. The workings consist of 7000 feet of tunnels, winzes and upraises, with a large amount of ore blocked out. The first shipments from this property were to San Francisco, via Umatilla, at a cost of \$100 per ton. The general run of the ore is about \$20 per ton. The prop-

erty was recently sold by Mr. Cabell to Keith & Bamberger of Salt Lake City, who are now operating. The concentration mill on the property is handling about twenty-five tons of ore per day. It is stated the mill will be enlarged this year. J. X. Ferguson is superintendent, John Roden mine foreman and Frank Robb mill foreman.

The Grant Gold Mining Co. are operating hydraulic placer works on the north fork of the John Day river. They have about \$150,000 invested in the vicinity, employ thirty men and operate a No. 4 and No. 5 giant, having about 2000 miners' inches of water and 300 feet pressure. B. F. Grant is local manager.

The Red Boy, four miles from Granite, is well developed and is a reliable producer. The two parallel veins, which follow the alignment of a mountain ridge, are tapped by crosscut tunnels, the first of which cuts the vein at 400 feet and 250 feet below the surface, the second tunnel cutting the vein at 1000 feet and at 300 feet depth. The work of drifting on the veins has progressed to a considerable degree.

The ore is quite free milling, the management claiming to save 75 per cent of the values on the amalgam plates. A new 20-stamp mill is in course of construction, which will be equipped with modern machinery for amalgamation and concentration. In connection with the property is a covered flume, two miles long, by which water power is developed to operate the mill. The ores run in value from \$12 to \$20 per ton. The Red Boy is the property of E. J. Godfrey and Clark Taber.

George J. Barrett, manager of the May Queen M. & M. Co., is developing a group of claims which adjoin the Red Boy. A 300-foot tunnel has been driven on the vein from the outcrop, which shows the ledge of ore to run from 15 to 40 feet wide. The ore, while partially free milling, is in the main a sulphuret of iron, carrying good values in gold. Mr. Barrett states that a mill will be built as soon as the development of the ore body shall fully warrant it.

WASCOTT.

Sumpter, Or., June 14th, '98.

A British Columbia Enterprise.

R. H. Campbell, formerly of Siskiyou Co., Cal., has put two hydraulic elevators on the property of the Cariboo G. M. Co., Ltd., of London, capital stock \$500,000, which secured five mining leases and five government grants on Williams creek. Over \$250,000 is reported to have been spent in preparing this property for mining. The property is near Barkersville. Work is being started on the end of the Ballarat claim, where the two elevators stand side by side.

In the bottom is an inlet nozzle for the water under a head of nearly 800 feet, that will direct this stream of water up the pipe, in the lower side of which is an opening or gate into which the gravel is run by other streams and then elevated in the sluices by the force of the elevating jet from the nozzle. In this pipe the diameter is contracted to 12 inches at the throat, but above that the pipe is 18 inches in diameter. These elevators are set at an inclination of 30° from the vertical, and it is estimated that with the head of water, 1200 to 1500 cubic yards of gravel can be raised per twenty-four hours in each elevator with 600 miners' inches or 900 cubic feet of water per minute.

In beginning this work a shaft 5x8 ft. 4 in. was sunk to bedrock through 68 feet of gravel, in which was placed the elevators; another inclined shaft sunk at right angles to the first one, down which pass the water pipes to the bottom of the elevators. The vertical lift from bedrock to the sluices is 88 feet. A pit will be worked out about the elevators and down to bedrock by using monitors with nozzles 3 to 4 inches in diameter to wash the material towards the gates in the elevators, and as this pit enlarges, the sluices will be extended and the elevators moved farther up the stream. On trestles 20 feet above the surface, 800 feet long, are the sluices, in two compartments, 4x4 feet, paved with wooden riffle blocks. The top of the pipe of the elevator is let into the floor of the sluice, and a hood is placed over the discharge. A drain tunnel, 2900 feet, has been run to the bottom of the elevator shaft to drain all the water down to bedrock.

To carry the waters of Williams creek past these operations a small dam was built across the creek 1400 feet above the elevator shaft. A flume 2200 feet long, 6x14 feet, in two compartments, discharges near the lower end of the sluices. From a pressure box at the ditch two lines of piping, 5000 feet each, carry the water to the foot of the elevators under a vertical head of 792 feet. The welded wrought-iron piping decreases the diameter from 36 inches at the top to 18 inches at the bottom, the lower pipes being of 1-inch metal.

Fourteen miles of ditch have been completed to carry water from all the lakes and streams on the mountain sides tributary to Williams creek and reservoirs were made to impound all water that could be got. This ditch, 9 feet wide on the top, 4 feet on the bottom, 2½ feet deep, with a grade of 9½ feet per mile, is expected to carry 2000 miners' inches of water.

Some New Patents.

Fig. 1.

MIXER.—Patent No. 605,668, dated June 14, 1898: Thomas A. Edison, Llewellyn Park, New Jersey: apparatus for mixing concentrated pulverized iron ore with a binding material preparatory to the molding of the material in briquets. Fig. 1 is a longitudinal section of the mixing trough, showing in elevation two sets of the mixing devices. Fig. 2 is a cross-section on line 2-2 of Fig. 1.

Fig. 1.

APPARATUS FOR REMOVING GRAVEL FROM FROZEN GROUND.—Patent No. 605,512, dated June 14, 1898: R. H. Pinkham, Wakefield, Mass. The object of the invention is to provide a device capable of use in winter, when the ground or gravel to be extracted is frozen solid. Fig. 1 is an elevation of the complete apparatus in the relative positions assumed in operation. Fig. 2 is an enlarged detail view of the extracting nozzle.

ORE STAMP.—Patent No. 605,615, dated June 14, 1898: D. M. Smyth, Pasadena, California: improvement in ore stamps. The stamps are actuated by electromagnetism; two stamps are so connected that one stamp is raised as the other one is projected downward, thereby causing the stamps to work in unison. The drawing is a diagrammatic elevation illustrative of two stamps, their actuating helices, and switch and circuit connections to a battery or other source of electric energy. The stamps A B are of any desired character, and the material to be pulverized is introduced upon a bed D, either dry or in connection with water, in any desired manner, and the stamps advantageously are operated vertically, and a suitable frame C, with cross-bars E, is provided for supporting the helices F G H I, through which the stamps A B are free to reciprocate, and

to the binding posts K L conductors are led from a battery or other source of electric energy, and there is a switch N, having arms 2 and 3, acted upon by the stamps and serving to move the switch to the contact 5 and then to the contact 4, and the circuit connections are arranged substantially as indicated—that is to say, the return wires 9 6 7 8 from the respective helices lead to the binding post K and the negative electrode, and the wire 10 leads from the positive electrode to the switch N, and the contact 5 of the switch is connected by the wire 11 to the magnet H and by the wire 12 to the magnet F, and the contact 4 is connected by the wire 13 to the magnet I and by the wire 14 to the magnet G.

Fig. 1.

COMBINATION BLASTING TOOL.—Patent No. 605,727, dated June 14, 1898: George Laws, Philipsburg, Penn. Fig. 1 is a view of completed tool. Fig. 2 is a longitudinal section thereof. Fig. 3 is a view showing how a paper cartridge cylinder may be formed on the tool.

Primitive Mining.

H. R. Ayres, returned from a European tour, tells the *Denver Republican* about primitive methods in vogue in some of the mining districts there. "I decided to make an investigation into methods of mining and the treatment of ores, to see if there was anything in use in Europe that was an improvement over our processes of ore treatment and concentration. I may say right here that the United States is far in advance of any other nation, both in mining machinery and the processes for saving the precious metals. They can make our machines in Europe, but they do not make them as well as we do, and certainly do not secure as good results. The most interesting portion of the tour was in the mining regions of Hungary and Austrian Silesia. I visited Schemnitz, Kremnitz, Veraspatic and Brad in Hungary and Freiwaldau in Silesia. At Schemnitz there is a plant in operation equipped with Huntington mills, at Kremnitz there is a 20-stamp mill, at Brad two stamp mills, one of forty and the other of twenty stamps, and at Freiwaldau a 10-stamp mill and a plant of Huntingtons. All of the machinery in these mills was imported from this country except the boilers and engines. The concentration is done with Frue vanners, jigs and sizers. The work done is fairly good, but it is my opinion that under similar labor conditions Americans would secure much better results.

"Most interesting to me was the method of reduction in vogue among the poorer classes of miners. This was especially noticeable in the gulch that I visited at Veraspatic, though the same conditions prevail at Schemnitz and Kremnitz. The gulch is lined with miners' cabins all the way up to the mines, and in front of each cabin is a battery of from ten to twenty stamps, operated by water power from the stream which runs down the gulch. These mills are of the most primitive character, being constructed entirely of timber, the heads of the stamps being heavy stones. The main shaft is a heavy timber, in which are inserted strong pegs, which, as the shaft revolves, catch on shoulders in the stems of the stamps, the stems being also heavy timbers. These pegs raise the stamps up and as they pass from the shoulder let them drop on the ore in the mortar, which is usually a trough constructed of heavy stones. The labor at the mills is all performed by women. The men are engaged in the mines and in bringing down the ore on pack mules. The women shovel the ore into the mortars and catch the pulp in great rawhide basins, in which the amalgamation is done. All of the manipulation is done in these basins, which are skillfully handled by the women, and serve both as amalgamators and concentrators, the earthy matter and silica being washed out in the same manner as in panning in placer mines, leaving the free gold amalgamated and the concentrates ready for collection. The concentrates are saved and shipped to Zollinger, Hungary, where they are treated in a smelter owned by the Government. I am told that the saving by these methods is very close, and that practically the entire low-grade product of the mines is utilized in this way. Of course, this is only practicable where the labor conditions are as they are there. The people make a good living as things go there, are industrious and seem contented and happy. I counted no fewer than 1500 of these primitive stamps, all of which were in operation. The concentrates from the mills at Freiwaldau are shipped to Swansea, Wales, for reduction."

Notes on Some Supposed Nickel and Cobalt Minerals.

By WALDEMAR LINDGREN.

The color of certain minerals may often be misleading to inexperienced eyes, causing the prospector to expend much energy and money without corresponding result. A striking instance of this came under my observation last summer in one of the mining counties of the Sierra Nevada. In this case the deception was caused by chromium, the salts of which, as is well known, are often characterized by brilliant colors. At a contact of serpentine and slate some vein matter was found, chiefly dolomite, with green mariposite. Bunches of chromite also accompanied the occurrence, and on fractures in this chromite bright rose-colored and green crusts were noted. It was decided by some local expert that these crusts were cobalt and nickel minerals, many of which indeed have this color. Assays were said to have been made showing the presence of these metals. Excavations were begun and even smelting works were proposed to reduce this rich nickel and cobalt ore. Upon examination it was found that the rose-colored crusts consisted of a chromium chloride, first recognized in this State some years ago by the writer, described in the Proceedings of the California Academy of Sciences, and known to mineralogists as "kotschubeite." The green mineral proved to be a garnet likewise colored by chromium, and closely allied to the species uvarovite. The bright green color of the mariposite is also, as is well known, caused by a small percentage of chromium.

All of this tends to show that it is, in general, a good plan to consult a competent assayer and mineralogist before starting a nickel and cobalt mine. In this connection, it may be of some interest that one of the few occurrences of cobalt minerals in this State is about two miles north of Cisco, Placer Co., where cobaltine—a silvery white mineral with reddish tinge—occurs as impregnation in a mica schist, near the granite contact.

San Francisco, June 24th, '98.

Liquid Chlorine.

TO THE EDITOR:—I have something new—liquid chlorine. The use of liquid chlorine in chlorination is new, and is a great step in advance in the metallurgy of gold. By its use chloride of lime, manganese, salt and sulphuric acid, for generating chlorine gas at the chlorination works, are to be remembered, for they will be of the past.

Liquid chlorine is condensed chlorine gas, and, as we have received it, comes in steel drums 10 inches in diameter by 5 feet high, weighing 300 pounds and holding 110 pounds of liquid chlorine under pressure of eight to twelve atmospheres. Each drum contains enough gas to successfully treat fifty to seventy-five tons of sulphides. We began to use liquid chlorine at the Utica chlorination works May 8th, and we have found it perfect in every particular.

THOS. N. SMITH.

Angels Camp, Cal., June 20th.

The chlorination process was practically a California invention, the late G. F. Deetken of Placer Co., Cal., making it commercially important. Now it appears another California mining man makes further advance in economic methods. It is understood that the liquid chlorine used by Mr. Smith, as above, is the first consignment of the kind from Germany, where it is manufactured. Some of the chlorine gas hitherto used has been a California production, being locally manufactured from binoxide of manganese.

We are already in the dawning twilight of the National Birthday, and next Monday promises to be the largest and most intense Fourth of July which the country has known since the centennial year. It could hardly be otherwise. Never before has such patriotic fervor so permeated the nation, because an issue has arisen in which the American people are a unit. Never before has the issue seemed so widely significant, not only to ourselves, but to the world. Never before have we been called upon to realize so keenly how important our national principles are to mankind and how splendid our mission to maintain them. This being the case, it is to be expected that the observation of the greatest national holiday will be characterized this year with exceptional spirit and unanimity on the part of the people. Clear indications of this fact are already appearing in the arrangements for the day at all centers of population, and no doubt quiet communities will also be stirred to their depths by the spirit if not by the noisiest demonstrations of it. The cities of the Bay will have the advantage of the thousands of troops gathering for the Manila expedition to serve as nuclei and the multitude of civic organizations will cluster around them. If the people, young and old, do not become prostrated by the intensity of patriotic ardor and its various manifestations, it will speak well for the elasticity of their heart tissue and their aural membranes. All that is needed now to carry the people out of their depth in the surging sea of emotion is for Sampson and Shafter to give Uncle Sam the city of Santiago before Monday morning. And there seems a good chance of it.

Mining Congress Officials.

The second annual session of the International Mining Congress will be held at Salt Lake, Utah, July 6th, 7th, 8th and 9th. The delegate appointments to date number nearly 1800, representing twenty-seven States and Territories. The funds in hand exceed \$5000 and will be at least \$6000 by the opening of the Congress. The programme just announced by the committee includes a number of social features as well as the practical business affairs of the convention. It is expected the first day, Wednesday, July 6th, will be occupied with organization. Thursday's business sessions will be devoted to the subjects designated by the Committee on Order of Business. Among the subjects to be presented in papers prepared for the occasion are the following: Coal and Coke; Advances in Methods of Concentration; Relation of the Geological Survey to the Mining Industry; Relative Merits of Cyaniding and Chlorination; Mine Inspection; History of Reduction of Smelting Costs; Long Distance Transmission of Electric Power; Fuel Cost in Pumping; Recent Advances in Smelting; A New Treatment of Low Grade Ore; Copper; Relations of Investors and Miners. The selection of the next place of meeting will be left until Saturday, the last day of the session.

Herewith is presented engravings from photo-

GOV. H. M. WELLS.
Chairman Local Executive Committee International Mining Congress.

JNO. DERN.
Vice-President International Mining Congress.

W. D. JOHNSON.
Sec'y Executive Committee International Mining Congress.

graphs taken especially for the MINING AND SCIENTIFIC PRESS of three men prominent in local furtherance of the work. Gov. Wells, the chairman of the Mining Congress, is a native of Utah and its first executive. John Dern, vice-president of the Congress, is a native of Germany, long resident of Nebraska, but now of Utah. He is president of the Mercur Gold Mining Co., is heavily interested in the Geyser-Marion Co. of Mercur and its president and general manager. He was one of the most active delegates in the Denver Congress of 1897. W. D. Johnson, the secretary, was born in Lawrence, Kas., moved to Chicago in his youth and was educated there. He went to Utah in 1896, where he has been engaged in mining investment, was chosen a member of the executive committee, and when the local organization was effected was made secretary of the executive committee.

Edison as a Humorist.

The manager of the Electrical Exposition in Philadelphia asked Mr. Edison to visit the show and give a short talk on some electrical subject, or if he found it inconvenient to do so, to send on a phonograph cylinder setting forth some of his latest ideas of electrical interest. Mr. Edison complied in his own way with the latter request, and in doing so, while omitting any reference to electricity, produced quite an electrical effect upon the management and the auditors by his contribution. It was as follows:

MY DEAR MARKS: [You asked me to send you a phonographic cylinder for your lecture this evening and to say a few words to the audience. I do not think the audience would take any interest in dry scientific subjects, but perhaps they might be interested in a little story that a man sent me from a phonograph cylinder the other day from San Francisco:

In the year 1873 a man from Massachusetts came to California with a chronic liver complaint. He searched all over

the coast for a mineral spring to cure the disease, and finally he found down in the San Joaquin valley a spring the waters of which almost instantly cured him. He thereupon started a sanitarium, and people from all over the world came and were quickly cured.

Last year this man died, and so powerful had been the action of the waters that they had to take his liver out and kill it with a club. Yours truly,

EDISON.

—Electricity.

Liquid Hydrogen.

At the meeting of the London Chemical Society on June 2nd, Prof. Dewar gave a short account of the first attempts made to determine the physical constants of liquid hydrogen. Among the most interesting points brought forward, according to the report in *Science*, was that just as in the middle of the last century chemists were startled by Cavendish's discovery of a factitious gas, namely, hydrogen, having a density one-fourteenth that of air, so now they were startled by finding in liquid hydrogen a liquid having a density of 0.07, or, roughly, one-fourteenth that of water. Hydrogen occluded in palladium has been found to have a density of 0.62. Whatever, therefore, be the form in which it exists in that metal, it is more than eight times denser than in the liquid condition, and, consequently, must be in a state of chemical combination, and not merely in one of liquefaction. Liquid hydrogen is thus by far the most extraordinary liquid known. The lightest liquid hitherto obtained is liquid marsh-gas, which has at its boiling point a density of about two-fifths that of water. Liquid hydrogen, therefore, has only one-sixth of the density of liquid marsh-gas.

Professor Dewar has determined the boiling-point of the liquid by means of a platinum resistance thermometer—practically the only form available at such low temperatures. The result he has obtained is -238° C. at atmospheric pressure; in other words, liquid hydrogen boils steadily at 35° above the zero of absolute temperature. From all analogy it is inferred that the lowering of temperature that will be produced by forcing the liquid to boil *in vacuo* cannot amount to more than 10° or 15° . It is, therefore, possible to say with confidence that at the present moment science can project no method that will get nearer to the absolute zero than 20° or 25° .

The boiling-point of liquid hydrogen is really higher than suggested by theory and the work of other experimenters. The density of the vapor coming off from the boiling liquid is eight times denser than the gas at ordinary temperatures, whereas in the case of liquid air the vapor is only four times heavier. Liquid hydrogen, again, is 100 times denser than the vapor it is giving off, whereas the density of liquid oxygen is 255 times greater than that of its vapor. The atomic volume of liquid hydrogen at its boiling point is 14.3, while that of oxygen is 13.7.

It may be mentioned that the platinum resistance thermometer when immersed in the liquid hydrogen is cooled to within six platinum degrees of its zero point, so that if cooled these few degrees more—as it can be by means of the liquid boiling under reduced pressure—it must break down, becoming an infinite conductor with no resistance.

State Maps and Register.

The State Mining Bureau has in present process of preparation maps of several of the mining counties, designed to show the location of the various mines and mineral deposits therein, to accompany registers of the same designating the names, character, etc., the first supplementing the other. About seventeen are now being compiled, the intention being to ultimately so district the entire State. The registers are prepared in tabulated form. That of Nevada Co. is about complete and gives a fair idea of the scope and character of the work. There are 357 quartz, drift and hydraulic mines enumerated and described.

The list begins with the "Ajax, Grass Valley, Sections 2-11, Township 15, Range 8, Map No. 148, Patented, 2200 feet elevation, 1 vein 12 inches wide, strike north and south, dip west, character of ore gold quartz, with galena and sulphide, hanging wall granodiorite, foot wall granodiorite, etc."

Descriptions are full and exact, as No. 3 on the list: "Allison Ranch, Grass Valley, Section 2, Township 15, Range 8, Map No. 146, Patented, 2140 feet elevation, 1 vein, width 6 feet 3 inches, strike north and south, dip 41° west, character of ore gold quartz with galena and sulphurets, hanging wall granodiorite, foot wall granodiorite, shaft incline, 800, 370, tunnel, drifts 5000 feet, greatest depth below outcrop 400 feet, mill power water, number of men employed 54, owners' name Allison Ranch Con. Mg. Co., residence San Francisco, superintendent's name Chas. E. Uren, residence Grass Valley."

In its issue of June 22 the usually correct Boston News Bureau gravely gives place to the following: "The directors of The Electrolytic Marine Salts Co. have declared a dividend of 3% to stockholders of record of June 22, 1898, payable July 15. Since February 4, 940.43 ounces of gold have been received and 1834.51 ounces silver. Over 5,000,000 tons sea water have been treated by the accumulators to produce the above result. Three hundred men are now at work constructing what is known as plant No. 2."

Coast Industrial Notes.

—The new foundry of the Standard Iron Works, Los Angeles, Cal., is completed. A ten-ton crane has been installed.

—An effort is on foot to sell the Bear Valley, Cal., irrigating plant to farmers of Redlands, Alessandro and Perris. It is valued at \$255,000.

—Baker City, Oregon, will hold a special election this month to decide upon bonding the city for \$124,000 for a gravity water system, or \$16,000 to sink wells.

—W. D. Hodus & Co. of Seattle, Wash., were the purchasers of the plant of the Port Townsend Wire and Nail Co., recently sold at receiver's sale for \$5000.

—The Pacific Sheet Metal Works at Fairhaven, Wash., are now making 150,000 cans per day. They have 2,500,000 salmon cans ready for shipment to the canneries.

—Thirty-one carloads of fruit were shipped East from Sacramento, Cal., last Wednesday. The shipments to date amount to 788 cars, 130 more than to the same date last season.

—C. S. Dunphy and associates propose to tap Malheur lake in Harney county, Oregon, by a canal forty-five miles long for irrigation purposes. The arid land to be benefited is estimated to comprise 65,000 acres.

—The Thermal Belt Water Co. at Santa Paula, Cal., at a cost of \$13,000, has installed a pumping plant for supplying irrigation water to farms and orchards. The pump has a capacity of 3000 gallons per minute.

—A movement has started at San Diego, Cal., to complete the Pamo dam and water-works, to furnish water for the Linda Vista irrigation district. The work will cost over \$800,000, and will open up 40,000 acres of fertile land.

—The Northern Pacific railroad is reported to have acquired the Spokane Falls & Northern railroad after competition with the Canadian Pacific. The road is 140 miles long, with allied lines of 77 miles running into the Kootenai country.

—Some large California and coast contracts have resulted from the war measures, mostly ships, clothing and food supplies, as in other parts of the country. The Armours of Kansas City, Mo., have one order for 3,250,000 pounds of corned beef for Tampa, Fla.

—The first cargo of coal ever shipped to the Philippines left Philadelphia last week for Admiral Dewey on the British ship East Lothian. The freight rate is \$7.50 per ton. Heretofore the Philippines have received their coal supply from Japan and New South Wales.

—The plant of the San Gabriel, Cal., Electric Power Co. was started last Saturday. The company develops its power in San Gabriel canyon, twenty-three miles from Los Angeles, and transmits it over wires which are laid underground in the business portion of the city.

—There arrived at San Francisco by the Coptic, the latest China steamer, 441 cases of opium prepared for smoking, which, at the price of \$15 per pound, duty paid, is valued at \$264,600. The duty amounts to \$158,760. This opium is only for smokers, and is intended for use in the United States.

—At New Whatcom, Wash., the Bellingham Bay Improvement Co. mill was burned last Monday. The loss is estimated at \$400,000. The principal stockholders of the company owning the mill are P. B. Cornwall, D. O. Mills and Alvina Hayward of San Francisco. The mill employed 140 men.

—At New York the American Asiatic Association has been formed for the purpose of "fostering and safeguarding the trade and commercial interests of the citizens of the United States and others associated therewith, in the empires of China, Japan and Corea, the Philippine Islands and elsewhere in Asia or Oceania."

—The Puente Oil Co. is building a storage tank near San Bernardino, Cal., that is 80 feet in diameter with a capacity of 30,000 gallons. It will be used for a reserve supply of the residuum from the stills, which is used for fuel by the sugar company. The refinery is turning out 60,000 gallons of refined illuminating oil, 30,000 gallons of gasoline and 10,000 gallons of distillate per month.

—Mention was made some months ago of the company which is developing a water supply and electrical power in Sutter Creek, Cal., preparing to transmit electric power to San Francisco and Oakland. G. De Golia, agent of the company, now petitions for permission and franchise to erect telegraph poles through Alameda county to the plant for the conveyance of electric current.

—All the oranges grown in southern California do not represent much more than one-half the value of southern California's mineral production. The Los Angeles Review notes that while southern California is producing from 12,000 to 15,000 carloads of oranges a year having a local value of something over \$3,000,000, the value of southern California's mineral production last year was \$5,685,608.

—Work upon the tunnel for the S. F. & S. J. Valley road is progressing. The contractors have seventy-five men at work night and day, working twelve-hour shifts. Engineer Storey says that the work of building the extension of the Visalia branch from Visalia south to Corcoran Junction, on the main line, is progressing. It is expected that the line will be ready for operation September 15th.

—The U. S. Government contemplates making a large contract for coal with which to supply its ships on this coast. This contract has aroused the interest of the coal sections of this coast. At present the department is analyzing samples of coal from different mines with a view to determining the efficiency of their product, and on this examination will

depend, to a great extent, the award of the contract.

—The Bolivian, S. A. rubber lands are situated on the headwaters of the Amazon river and its tributaries, and are as yet comparatively unknown. They are said to be very rich, and the Bolivian Government is making every effort to attract settlers by liberal concessions and by making it easy for settlers to claim lands. Senor Luis Paz, the Minister of Bolivia in the United States, wishes to have citizens of the United States know the opportunities which await them in Bolivia.

—Los Angeles, Cal., expects to deliver during the next year 180,000 barrels of oil to the new Spreckels beet sugar factory at Salinas. At present prices the rate of 8½ cents a barrel for this order is considered fair. The same San Francisco men making this contract have also closed contracts at Coalinga for the delivery of from 500 to 700 barrels of oil a day for a period of two years. All the furnaces at the different Spreckels sugar factories are being changed from coal to oil burners.

—I. Sternfeld says that his plan to utilize the waterfalls of the Monte Alto river, Mexico, has succeeded and that "the contract calls for a 6000 H. P. transmitter, and the current will be carried from the river into Mexico City, a distance of thirty-five miles. The pressure will be 23,000 volts, and it will be carried over three wires into the city. The incline of the Monte Alto river amounts to about 2000 feet, and there are five of the falls where generators will be placed, four of which will be set in each fall."

—So far the Pacific Mail Co. has furnished five steamers to the Government. The following valuations have been made on four of the boats: City of Pekin, \$650,000; City of Sidney, \$470,000; China, \$900,000; Colon, \$350,000. Should any of these vessels be destroyed by the enemy the Government would have to pay the valuation; if they are lost by the action of the elements, the company must stand the loss. The company asked \$1700 a day for the charter of the China, but the Government was unwilling to pay more than \$1500, and this offer was accepted.

—Washington State papers are opposing grain rates as imposed by the Northern Pacific and O. R. & N. Railway Companies, claiming that the present charge for transportation of grain from Eastern Washington to the sea coast is six times more than the price charged by Eastern lines for moving grain from Chicago to New York, a distance of 1000 miles, more than double, and in some instances three times greater than the distance from the wheat fields of Eastern Washington to Puget Sound. There may be 25,000,000 bushels of wheat produced in that State this year.

—At a meeting of the Merchants' Association June 29 the following resolution was ordered forwarded to the Pacific Coast representatives in Congress:

WHEREAS, The early construction of the Nicaragua canal is essential to the future development and prosperity of the Pacific coast by and from the markets of the world; and whereas, the completion of the Nicaragua canal under American control will duplicate the effective value of the United States navy, as shown by the recent perilous trip of the peerless Oregon around South America; and whereas a practicable bill for the construction and completion of the Nicaragua canal by our Government is now pending in the Senate of the United States; therefore, be it

Resolved, That the Merchants' Association appeals to all commercial and industrial organizations on the Pacific coast to unite in a vigorous movement that will ensure a prompt beginning of this invaluable undertaking.

—The results of the recent school census in southern California and the present population of the principal towns, as estimated on the basis of 4½ to 1, are as follows:

| | Estimated population. |
|---------------------|-----------------------|
| San Diego..... | 16,236 |
| Pasadena..... | 12,704 |
| Riverside..... | 8,199 |
| San Bernardino..... | 8,118 |
| Santa Barbara..... | 7,880 |
| Pomona..... | 5,652 |
| Santa Ana..... | 5,184 |
| Ventura..... | 4,818 |
| Redlands..... | 4,836 |
| State Monrovia..... | 3,089 |
| Anaheim..... | 2,983 |
| Ontario..... | 2,806 |
| Long Beach..... | 2,398 |
| Colton..... | 2,335 |
| Chino..... | 2,283 |

—Nearly \$33,000,000 in gold has been received in San Francisco from Australia since August 22, 1897. The most recent consignment was \$100,000 in English sovereigns—\$486,600—on the Sydney steamer which arrived here on the 29th ult. Nearly all the gold has been received at the San Francisco mint and in the shape of \$5, \$10 and \$20 gold pieces sent to New York; about \$33,000,000 went on the Newport with Gen'l Merritt to the Philippines last Wednesday. The several Australian gold consignments mentioned are in detail as follows:

| 1897— | |
|-------------------|--------------|
| August 22..... | \$2,189,925 |
| September 23..... | 3,587,069 |
| October 21..... | 2,207,047 |
| November 18..... | 1,581,450 |
| December 16..... | 1,238,154 |
| January 13..... | 1,021,986 |
| February 10..... | 2,510,160 |
| March 9..... | 1,459,800 |
| April 6..... | 2,185,023 |
| May 3..... | 1,703,100 |
| June 1..... | 2,800,828 |
| June 29..... | 486,600 |
| Total..... | \$22,970,849 |

—On the principle that trade follows the flag, and that our flag now floats over three United States expeditions en route to the Philippines, and over a victorious navy in far Eastern waters, United States trade conditions in that region are of interest. Last week was published figures relative to the Philippine trade. As to China, the exports from this country to that in 1896 amounted to less than \$7,000,000 in value, or only about 4 per

cent of the entire amount. The following table shows how our export trade to China developed in the course of one year, the figures being for the fiscal years 1896 and 1897:

| | 1897. | 1896. |
|--------------------------------------|--------------|-------------|
| Clocks and watches..... | \$31,242 | \$13,053 |
| Provisions..... | 45,640 | 50,191 |
| Wheat flour..... | 72,100 | 45,815 |
| Wood, and manufactures of..... | 118,400 | 154,045 |
| Tobacco manufactures of..... | 229,596 | 102,138 |
| Iron and steel, manufactures of..... | 33,007 | 84,398 |
| Mineral oils..... | 3,371,937 | 2,166,978 |
| Cotton cloths..... | 7,438,203 | 3,854,146 |
| All other articles..... | 281,304 | 359,467 |
| Totals..... | \$11,916,888 | \$8,921,138 |

This shows an increase of about \$5,000,000 in one year, but one in which the Pacific coast has borne but little part.

Personal.

F. CORRHILL is Supt. Deadhorse mine, Carvers, Cal.

J. HURLEY, a mine owner at Keisley, Cal., is in San Francisco.

A. L. BEGHE is Supt. Mt. Pleasant mine, Grizzly Flat, Cal.

F. C. INNES, Mgr. Fern mine, Nelson, B. C., is in San Francisco.

CAPT. J. R. DE LAMAR has arrived from Europe at Mercer, Utah.

J. W. RICHARDS is Supt. Uncle Sam mine, Quartz Mountain, Cal.

I. S. FOORMAN has returned to San Francisco from Calaveras county.

F. CHAPPELET, of Oakland, Cal., is visiting his mines at Forest Hill, Cal.

W. A. FARISH of Denver, Colo., is at the Old Spanish mine, Shasta, Cal.

W. CAMPBELL, a mine owner of Grass Valley, Cal., is in San Francisco.

CHAS. BUTTERS arrived at Oakland, Cal., from South Africa last Monday.

E. W. BARRY, banker and mining man, Idaho City, Idaho, is in San Francisco.

W. H. CLARY, Jr., Supt. Petticoat mine, Railroad Flat, Cal., is in San Francisco.

R. MC F. DOBLE is now president and manager of the Abner Doble Co., San Francisco.

S. McDONALD, Mgr. Payne mine, Kaslo, B. C., has returned home from San Francisco.

W. RHODES, managing owner Big Four mine, Garden Valley, Cal., is in San Francisco.

W. PELLEW HARVEY of Vancouver has been appointed engineer to the Associated G. Mines of B. C.

JNO. HAYS HAMMOND is in Paris, France, and is expected in San Francisco about September 1st.

W. ARMSTRONG, City of Mexico, a mine owner in Mexico and a former Comstock miner, is in San Francisco.

S. B. CHRISTY of the University of California will represent that institution at the Salt Lake Mining Congress.

W. S. KEYES of San Francisco arrived in Salt Lake City last Wednesday as a delegate to the International Mining Congress.

F. SEARLES, mining attorney Nevada City, Cal., was in San Francisco this week, attending the obsequies of Robt. McMurray.

J. P. EVANS, auditor Colorado Iron Works Co., Denver, Colo., and S. W. Traylor, also of that house, are in San Francisco.

F. D. MILLER arrived in San Francisco on the 28th ult., eleven days from London, en route to the Philippines as descriptive artist.

RALPH NICHOLS is in New York city, en route to West Australia, where he will be Gen. Mgr. Boulder group of mines at Kalgoolie.

JULIAN KENNEDY of Pittsburg has been appointed consulting engineer of the Nicopol-Maripol Mining & Metallurgical Co. of Maripol, Russia.

GEO. H. EVANS, Gen. Mgr. Consolidated Gold Mines of Cal., Ltd., an English corporation operating in Butte, Cal., returned this week from London.

CAPTAIN W. R. ABERCROMBIE, U. S. A., in charge of the Government survey of Copper river, Alaska, left this week on the steamer Protection with a pack train of fifty horses.

MAYOR MORGAN of Auburn, Cal., has appointed the following delegates to the Mining Congress at Salt Lake City: B. F. Hartley, J. L. Rollins, W. R. Monahan, W. S. Davis, W. B. Fisher.

H. WOLLERMAN, of the importing firm of H. Wollerman & Co. of Wellington, New Zealand, is visiting the United States to buy mining machinery and other American products for shipment to New Zealand.

THE following is from the Spokane, Wash., Review: "John C. Davenport has gone to Siskiyou county, Cal., to superintend work on a copper property recently acquired by H. Mac Rae of Rossland, J. M. Price, L. Harris of London and J. R. Reavis of Spokane. A tunnel is to be run and other improvements undertaken."

Obituary.

ROBERT MCMURRAY, a pioneer miner and one of the best known men in California, died last Monday at Graniteville, Nevada Co. For many years he operated large hydraulic mines in that part of the State. He was a prominent member of the California State Miners' Association, a typical miner, enterprising and generous, always ready to aid others or work for the public good, and his memory will long be held in affectionate remembrance in the community where he passed so many active, prosperous years.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING JUNE 21, 1898.

606,113.—STEAM BEER GOVERNOR—S. H. Atchison, S. F.
605,839.—BOX FASTENER—S. F. Baker, Santa Barbara, Cal.
605,999.—CAMP STOVE—F. B. Charroin, Fairhaven, Wash.
605,947.—NECKTIE—C. W. T. Davies, S. F.
606,001.—SIDEHILL PLOW—M. C. Dethiefs, Willow, Cal.
606,149.—ASSAY FURNACE—J. G. Iis, S. F.
606,073.—RAILWAY BICYCLE—C. E. Nichols, Milan, Wash.
606,023.—BICYCLE PUMP—L. A. Payne, San Jose, Cal.
606,155.—ROUTING MACHINE—W. S. Richards, Albany, Or.
606,091.—MUD GUARD—C. I. and A. L. Seaguest, Portland, Or.
606,100.—PAINT BUCKET—H. G. Thompson, Hollister, Cal.
605,973.—STATION INDICATOR—H. C. Turner, S. F.
606,179.—STRINGING PIANOS—C. S. Weber, San Jose, Cal.
29,897.—DESIGN—ICE MACHINE FRAME—R. D. Holabird, Oakland, Cal.
24,888.—DESIGN—RING TWINE CUTTER—W. E. Rosebro, Elmhurst, Cal.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

BICYCLE PUMP ATTACHMENT.—L. A. Payne, San Jose, Cal.; assignor of one-half to M. V. Davis of same place. No. 606,023. Dated June 21, 1898. This invention relates to a pump attachment for bicycles, which is adapted to be so adjusted as to be operated from the seat post and is provided with connections by which air can be introduced to the pneumatic tires of either of the wheels without the use of a supplemental pump. It consists essentially in the combination with the seat post standard of a bicycle frame, of a vertically adjustable tubular seat post, a clamp by which it may be held at any desired point, a supplemental interior tube having the upper end fitted to receive and hold the saddle and the lower end provided with an air-forcing plunger so that by reciprocating this tube it will compress the air within the seat post standard. A tubular connection with this standard curves around the crank hanger bearing and has a connecting nipple, and a flexible tube is adapted to connect this nipple with the inlet valve of either of the wheel tires. After this connection is made it is only necessary to reciprocate the saddle post tube to fill the tires with air to any degree of compression.

THREAD AND TWINE CUTTER.—Walter E. Rosebro, Elmhurst, Cal. No. 23,888. Dated June 21, 1898. This invention consists of a ring having a triangular shank extending outwardly from one side, and this shank is made with concave sides, the meeting edges of which are drawn down thin and made sufficiently sharp to readily cut a thread or string which is drawn across them. Upon the outer end of this shank is fitted an ornamental button which covers the end of the shank and prevents any contact with the edges of the cutting knives, except when the string or thread is drawn beneath the head and against these edges.

Recent California Mining Incorporations.

Gold Channel Gravel M. Co., Grass Valley, to operate in Placer county; G. Mainhart, R. Scanlon, W. L. Baker, J. W. Hyatt, G. Gehrig.

Sheep Ranch G. M. Co., San Francisco; capital stock, \$600,000; W. H. Clary, B. F. Langford, G. R. Fletcher, G. F. Voltz, C. A. Kern, L. Schumacher, C. L. Feuser.

Greek Mine Co., San Andreas; capital stock, \$100,000; subscribed, \$6; M. S. Feinberg, F. J. Solinsky, J. Raggio, A. J. Smith, F. E. Logan.

Golden Sheaf M. Co., San Jose; capital stock, \$250,000; subscribed, \$36,000; C. H. Fuller, J. D. Mackenzie, C. Wehner, J. W. Dea, R. C. Long.

White Oak M. Co., San Francisco; capital stock, \$20,000; subscribed, \$10,000; S. J. Conger, W. S. Peters, H. A. Melvin, J. Hanshaw, F. F. Baker.

McGillivray M. & D. Co., San Francisco; capital stock, \$3000, all subscribed; F. Peterson, J. McGillivray, J. H. Hanson, G. McGillivray, H. Trevor.

Montezuma G. M. Co., San Francisco; capital stock \$50,000, subscribed \$212; W. F. Stevens, J. Kahn, G. A. Helmore, W. H. Porter, A. O. McGrew.

Pine Hill G. M. Co.; capital stock \$1,000,000, subscribed \$250; C. Rosenthal, F. C. Castleman, J. R. Mahone, T. Fox.

Recently Declared Mining Dividends.

Reward G. M. Co., California, 2½ cents per share; July 1.

Homestake, South Dakota, 50 cents per share, \$62,500; payable July 25.

Lillie, Colorado, 1 cent per share, \$10,000; July 1.

Smuggler, Colorado, \$10,000; payable immediately.

Wildman-Mahoney, California, 10 cents a share; payable immediately.

Horn Silver, Utah, 5 cents per share, \$20,000; June 30.

Boston & Colorado Smelting Co., 1½ cents per share; June 30.

Method of Determining Distances.

TO THE EDITOR:—For the benefit of surveyors throughout the country and in the interests of better workmanship and to the end that surveys made in a rough country by different surveyors may be more uniform in results and accuracy, I herewith give a method of determining distances either on hilly ground or a level plain that has been used by me for several years past with very good results.

This method has many advantages over the usual way of determining distances by right angled triangulation, both in expediency and accuracy; the possible introduction of instrumental and mechanical errors are, by this method, as nearly eliminated from the operation as can be.

Stadia measurements are objectionable on account of the necessarily short base and the necessity of considering angles of elevation and depression as well as the inclination of the rod. In the method here given the instrument itself takes care of all angles and you have always at hand the necessary tools with which to do the work; even a plumb bob can be dispensed with, as but one angle is taken.

In running a line select a place on the slope or top of a hill to which you can get a backsight; set off a base at a right angle to the line being run and mark its extremities by stakes or otherwise, as the case may require, or, if there is suitable ground some distance ahead, on or near the line; send your chainmen in advance and if the distance does not greatly exceed a quarter of a mile, let one of them set a marking pin firmly in the ground in line if possible and hold the end of the chain against it while the other draws the chain at a right angle to the line of sight; then with the chain or tape tightly stretched, let the one at the movable end proceed to describe an arc of a circle beginning at the point as near to a right angle from the line as can be determined by the eye and move in the direction of the transitman, he having adjusted his zeros and centered the telescope on the marking pin, unclamps the plates and turns the instrument to the extremity of the chain; clamp and follow the chain as it describes the arc by using the tangent screw so long as the included angle is increasing. Then we have, to illustrate, say, a 100-foot chain with 4° as the included angle — cotangent of $4^\circ = 14.3007 \times 100' = 1430.07$ ft. \times secant of 4° or $1.00244 = 1433.58$ feet, the distance. If you backsight to a right angled base, as previously mentioned, the secant does not enter into the calculation. By having the chainman drop a pin from the elevated end of the chain at a point as near to a right angle as he can judge by the eye, then going forward, set over the first pin; take the angle between the position of the pin let fall and the point at a right angle and multiply the cosine of the angle by the length of chain and obtain the exact length of the base to be used in calculating the distance by cotangents. With experienced chainmen the cotangents alone are all that is needed and the work can be done quickly and very accurately. In the field other expedients can be adopted such as holding one end of the chain against a tree where there is low underbrush, setting off your base to one side of the line on open ground.

W. B. SWANK.

It is now thought that "wireless telegraphy" cannot become practicable for long distances until the energy, now scattered profusely in all directions, can be concentrated in one narrow path. Eventually, though probably not at once, it may become possible to focus the electro-magnetic waves, like the rays of a searchlight, upon a point a great distance away. Under present conditions, it is calculated that at a distance of one mile the fraction of the total energy received on one square foot is less than 1-350,000,000 of the total energy radiated.

A LOCAL magnetic pole—a point where a dipping needle stands vertical

—is reported by Prof. Leist to exist at Kotchetovka, in the Russian province of Kursk. It is necessary to move twenty yards from this spot to change the direction of the needle one degree. At the point of this interesting anomaly, the ordinary compass needle swings freely, stopping indifferently in any direction.

Water Inches.

Irrigation water is measured generally by the cubic foot, by the gallon, or by the miner's inches. The miner's inch is a variable quantity, depending upon the head above the 1-inch orifice of discharge. It varies from a 4-inch head to a 6-inch head, and is not a uniform unit of measure. Thus, there are 50 miner's inches to a cubic foot per second, California measurement, and about 40 miner's inches, Colorado measurement. One cubic foot contains 7½ United States gallons of 231 inches.

CUBIC.

1 cubic foot per second equals:
2 acre feet in twenty-four hours.
60 acre feet in thirty days.
180 acre feet in three months.
720 acre feet in one year.
7.5 gallons per second.
50 California inches.
28.04 Colorado inches.

CALIFORNIA INCHES.

100 California inches equal:
4 acre feet in twenty-four hours.
1 acre foot in six hours.
120 acre feet in one month.
320 acre feet in three months.
440 acre feet in one year.
15 gallons per second.
900 gallons per minute.
77 Colorado inches.
2 cubic feet per second.

COLORADO INCHES.

100 Colorado inches equal:
5½ acre feet in twenty-four hours.
1 acre foot in 4.2 hours.
155 acre feet in one month.
465 acre feet in three months.
1860 acre feet in one year.
19.50 gallons per second.
1170 gallons per minute.
2.6 cubic feet per second.
130 California inches.

The term as applied to wells, such as "artesian positive," means one from which the water rises above the surface. "Artesian negative" is one in which the water does not rise to or flow above the surface.

"Phreatic water" is that nearer the surface and derived from absorption, and is a name given in a general way to all species of wells that are supplied from under ground water.

Will be the Largest Flag in the World.

The stars and stripes in the shape of the largest flag in the world will float over Morro Castle, Havana, when Blanco surrenders. The immense flag designed for this duty is already prepared by a patriotic Wall-street man. It measures 120 feet in length and 43½ feet in width, and it is believed that it breaks the record for size. It is so big that special bunting was made for it in Boston. The bunting measures 42 inches across in the rough. Made up in the flag, allowing for seams, each stripe measures 40 inches. It took a full piece of forty yards for each stripe except where they run into the jack. The jack measures 40 feet in length and covers the space of seven stripes. The stars are not very large. From point to point each star measures 14 inches. They are arranged in alternating rows of seven and eight, according to army regulations. The flag will cost \$290. Big as it is, it can be packed in a large traveling trunk and will not weigh more than 200 or 250 pounds.

THE spring of carboic acid in Sondra, supposed to be a result of ancient volcanic action in the region of the Thuringian forest, seems to be inexhaustible, a pressure of seventeen atmospheres at the mouth having continued without diminution. The yield is about 1000 cubic yards of gas per hour. Over ten tons of liquefied carbonic acid per day is produced from this supply, the gas being kept confined as it issues from the earth and used under pressure for power for the liquefying machinery and for a lighting plant.

Something New in Telephones.

W. F. Smith of San Francisco has invented an automatic telephone attachment, calculated to be more satisfactory than the present manner of communicating.

The telephone is the same as now used on present systems, only having a plate on the lower box, or, in case of hand telephones on standard, fitted with eleven buttons, and a proving slot to show that one has called up the right number. These buttons are numbered from 1 to 0, inclusive, and one disconnecting button, and are pushed down a short space in slots. To call up a number, the buttons are pushed down in rotation to make up that number. For instance, your number is 3429; you wish to call up 2685. Push down button marked 2 to bottom of slot, and let go; it immediately flies back. Push down button 6, let go, then button 8, let go, then button 5; immediately in front at proving slot shows 2685, and at central station, in a similar slot on switchboard, will appear the same number, under 3429, the number of your telephone, and your telephone is immediately connected with the one desired. When conversation is ended you hang up the receiver, push down disconnecting button; when all numbers disappear the connecting plug is thrown out, and any number you may desire to ring up can be gotten immediately, without waiting for central office, often at present ten minutes or more. Should it happen the number you wish is busy, the operator at central switches on the phonograph, and so informs you. If you wish to wait, leave the telephone, and the number, being exposed, shows operator you are waiting, and you will be plugged and connected as soon as the line is clear. Should you prefer to ring up another number, push down disconnecting number and proceed as before. The subscriber is thus in an independent position in regard to cutting and disconnecting, and the operator, who simply puts in plugs, can do more work.

Warships and Cruisers.

A battleship is primarily a vessel designed to bear the brunt of battle with the most powerful ships of an enemy's fleet. Hence, in a battleship great speed must be sacrificed, because the machinery necessary to operate the big guns, the complicated framework needed to give the vessel strength, and the thickness of her armor render it impossible to give her sufficiently large engines and coal capacity to produce the speed. Furthermore, a battleship, being so limited in her coal capacity, is not expected to make long cruises. Her business is to fight and not to run about. A cruiser, on the contrary, is expected to do a great deal of travelling. She makes long voyages and does duty on foreign stations in time of peace. In war she dashes up and down a coast watching for the enemy, or performs scouting duty ahead of a squadron. She must be able to carry coal enough for her long voyages, and she must have speed enough to run away from the enemy's battleships or to catch merchant vessels. Hence she sacrifices weight of battery and armor to speed. A protected cruiser is one which has a curved deck of steel over her engines and boilers, and has her coal bunkers arranged so that they give additional protection, two feet of coal being regarded as equal to an inch of armor. An armored cruiser is one which is further protected by light armor, not of sufficient bulk or weight to compel a sacrifice of speed. Our fleetest cruisers are the Columbia and Minneapolis, which can go from twenty-two to twenty-three knots an hour, but they have no armor and they carry only one 8-inch gun each and several smaller ones. The Massachusetts, which is a battleship, has nearly a foot and a half of Harvey-ized steel armor and carries four 13-inch, eight 8-inch and four 6-inch guns

in her main battery, but has a speed of only sixteen knots an hour. The Maine was not a cruiser, because in her construction, speed and coal endurance were in a measure sacrificed to armor and battery.

Physical Condition of Volunteers.

The numerous discussions bearing on the physical degeneration of the average up-to-date American citizen have recently had a very practical demonstration of fact in the number of rejections for unfitness for military service, as the result of test examinations of recruits.

Lieutenant-Colonel Mans, U. S. A., who has charge of the enlisting bureau, found that it was necessary to examine 17,000 applicants in order to obtain 12,000 who were fit for field duty. The results show in the main that the ordinary militiaman who represents the average metropolitan is by no means up to the requirements of a first-class soldier. In other words, it would appear that the best is done with the material at hand. The influences of city life in causing a lack of physical development and vital power are plainly manifested in contrasting the number of acceptances from country regiments as compared with those from the large cities.

It has long been admitted that the best blood comes to us from the rural districts, where healthful surroundings, outdoor life, and moderate living make the sum and substance of that vital resistance to degenerative influences which is capable of meeting all the ordinary strains of modern civilization. This is one reason why the country lad makes his mark and succeeds where the city-bred youngster fails. In a generation or two the enervating influences of city life tell in an unmistakable way upon the physical development of the sturdy yeoman, who then becomes narrow chested, weak kneed, short sighted, and is no longer in the fore in the race. This fact is strikingly exemplified in the alarming proportion of rejections in city regiments, to which reference has been made. From such a point of view, it is quite evident that the city man is losing his physical grip, for reasons obvious to all who study his habits and note the ultimately pernicious influences of his depressing environment.—Medical Record.

STATISTICS recently published by the Interior Department show that the Government still has over 600,000,000 acres unoccupied. This is enough to give each of the 73,000,000 people in the country a homestead of eight acres and still have 16,000,000 acres left. The land is distributed among twenty-six States and Territories. The largest amount is located in Alaska, where there are 369,572,600 acres. Most of this land will never be available for homestead purposes, of course, but its mineral value may be more than if the whole vast tract was available for grazing and farming purposes. The remainder of the land lies in productive States, but much of it is barren and arid or mountainous.

CAST-IRON PIPES are given extra strength by winding with wire, and the wire-wound pipes can be made of unusual lightness. This is the idea of a French iron master—M. Jacquemart—who makes the castings with projecting rings or bands to hold the wire in place. Annealed steel wire is used, and this is wound around the pipe in a lathe, the whole being then painted or dipped in asphalt. A pipe 6½ feet in diameter, cast in lengths of 13 feet, has been satisfactorily tested, the result showing the wired pipe to be capable of withstanding pressures much beyond those for which the unstrengthened cast iron is safe.

A NEW GAS, "crypton," has been discovered by Messrs. Ramsay and Travers. It is heavier than argon—till recently the latest discovered gas—and is present in the atmosphere in the proportion of 1 part in 20,000.

Mining Summary.

CALIFORNIA.

Amador.

Ledger: Liens have been filed for labor against the Summit mine at Sutter Creek, the property of the Central Eureka M. Co., for \$1047.50.—The Union Consolidated at Clinton has been shut down, and so far as known it is not the intention to reopen it until the proceeds of a recent assessment are in the treasury of the company.—The owners of the Butte Mountain mine at Jackson have leased it to tributaries for one month.—D. Fisher has secured an option on the Spagnoli at Clinton and will reopen the old shaft.—The Ivanhoe mine near Plymouth is expected to begin work with a 20-stamp mill.

Republican: Sinking continues at the Anita mine, Jackson.—At the Bellwether, Jackson, the water is kept out and the general impression is that the mine will soon be under new management.

Record: At the Onelda mine near Jackson they are said to have 15 feet of quartz at the 1500-foot level.—The Emmerson shaft at the Wildman-Mahoney mine, Sutter Creek, is down 160 feet and work is going ahead as rapidly as possible.—At the Potazuba mine the north drift at the 500-foot level is in 370 feet. They are in 4 or 5 feet of quartz; the flow of water is large.—The hoisting machinery at the Lincoln mine is nearly completed. Supt. Voorheis says that the engines will be ready to run July 1st. The shaft has been cleaned out and timbered to a depth of 98 feet.

Butte.

The Consolidated Gold Mines of Cal., Ltd., operating in Butte Co., Cal., has been reorganized or reconstructed under a scheme embracing a liability of 62½ cents on each of the 250,000 shares; the company's liabilities of \$87,500 are to be liquidated, leaving about \$117,500 to carry on the proposed work.

The Banner mine resumes operation next Monday. The mill will begin crushing July 15th.

Six miles of ditch has been completed by the West Bros. to convey water to their gravel mine near Lovelocks.—Good pay dirt has been struck in the Butte Queen mine near Inskip.

Calaveras.

W. D. Burton bought the Green Mountain mine at Chili Gulch for \$5500. This is the property that produced the large crystals, a carload of which were shipped to New York.

Echo: Considerable gold has been taken from the Harris mine, near Angels, recently.—The Bovee mill has been crushing rock for a week from the Hog Pen mine. The ore averages well.

Citizen: P. L. Shuman has sold to the North Star Con. G. M. Co., for \$200,000 in shares of the purchaser's capital and \$20,000 cash, the Original North Star mine, the Three Ball placer mine, the Shuman placer mine, the New Combination placer mine, and mineral rights in Cornow Homestead and the Baudin tract; a 10-stamp mill on the Empire gravel mine is included. The mines are near Tuolumne Hill.—The Daupin mine, near San Andreas, has been unwatered and sinking the shaft has begun.

Prospect: Work is progressing at the San Justo, near Angels Camp, and the 40-stamp mill is running on ore from the 300-foot level. The old shaft is being cleaned out and in about a week the bottom—700 feet—will be reached and sinking begun. Forty-six men are employed. The canvas plant, operated by T. Lee, is being run as steadily as material from the mill can be furnished.—It is said that a French company will begin operations on the Whittle mine. The report is that the first work to be done will be to run a tunnel 1000 feet.—A stamp mill will be erected on the South Carolina mine, near Robinson's Ferry. They have a 30-foot ledge of \$8 rock. A tunnel is being run from the Stanislaus river to crosscut the ledge. This will be run 1200 feet, at which point it will tap the ledge at a perpendicular depth of 1000 feet and drain the mine of all water.—The Great Western, which was shut down for a short time, resumed operations.—The hoist and all the surface equipments at the Lightner are completed and the mill is running day and night.

El Dorado.

(Special Correspondence).—Work has resumed at the Unity mine near Granite Hill. The shaft will be unwatered and retimbered, and drifts will be run from the 300 level. The property is owned by San Francisco people.

The Big Canyon mine, operated by Hayward & Lane, because of lack of water, has ceased working the power drills and is operating only twenty stamps. The mill will probably close for the season within a few weeks.

At the Houx mine, near Shingle Springs, the shaft has reached 115 feet, and a ledge 3 feet wide of good ore has been discovered.

At the Rose Kimberly, near Rescue, a drift on the ledge is being run at the 150-foot level. The company will put in an air compressor.

At the Alta Vista mine, near Gold Hill, development continues with success. They have a 20-inch ledge that yields \$20 a ton by mill tests.

The cyanide plant at the Gentle Annie mine near Placerville gives satisfactory returns. This is a new venture in this section, and the results are carefully noted by mining men. A similar plant is in operation at the old Vandalia mine, fifteen miles west of Placerville, and it is said that it is worked with fair profits on the low grade ore of this long-abandoned property.

Work at the Hall mine, near Placerville, is progressing, and the results are encouraging to the investors. The mill tests of the ore yield good values.

The Dench & Craddock property gives a good yield through the 2-stamp prospect mill. The Limpensel, Hall, Skinner, Lemon, Crad-

dock and Morrow properties are practically new prospects, though work has been done upon them in a desultory way and in pocket-hunting years ago with some success. The systematic development of these mines, and seeking depth, is not only bringing about profitable results to the owners, but puts a new phase upon the undeveloped mining resources of the county. They are all within twenty minutes' walk from the courthouse, and, together with the Gentle Annie and Joe White mines—the latter an old-time property upon which work was recently resumed—form a continuous line from the town to the American river, a distance of two and a half miles.

The Gold Bug and Ida Mitchell, in the opposite direction, beginning in the center of town, will soon resume work under the auspices of a company organized in Fresno. They expect to push work on a large scale, backed by strong capital.

Placerville, June 20th, '98.

The Ohio mine at Greenwood is running with a full force. The ore body at 350 feet depth is of good value.—The Limpensel property at Placerville is productive of good ore at 250 feet depth. A mill run will be made on 100 tons of ore for a test.—The Hall Con., on the mother lode, in line with the Gentle Annie and Limpensel, is in good ore. The tunnel is being driven with power drills.

The mill at the Eagle King mine near Grizzly Flats has shut down owing to scarcity of water. Development work will be continued.

Nugget: G. W. Cummings is opening his slate quarry near Placerville. Five men are employed.—The Rose Kimberly, in Jay Hawk district, is crosscutting from the 100-foot level.—Work has been suspended for the season at the Hodgkins placer claim at Gray's Flat. It is said that rich gravel was found.

Kern.

Randsburg Miner: The Yellow Aster Co. has shut down the Visalia mill at Garlock and suspended all operations there. The last milling consisted of about sixty-six tons, which produced more than \$100 per ton.—About seventy tons of ore averaging about \$85 per ton have been run at the Johannesburg mill.

—Another strike has been won in Triby No. 2, and over \$3000 was taken out in one day.—Ore is being shipped to the Barstow mill, each car being loaded with twenty-five tons; a watchman accompanies each car. Thirty stamps of the new mill are dropping on this ore.

At the wells work is going forward in a satisfactory manner and the present supply amounts to about 30,000 gallons every twenty-four hours. It is the intention of the company to tunnel in from the bottom of the Skillings well, where they are now at work at a depth of 205 feet for a sufficient distance to get what water they want. Estimates are being made on putting in a 5-inch pipe line, a larger pumping plant and a 100,000-gallon tank.

Rand: Near Salt Wells much development work has been done by the Colo. & Cal. M. D. Co. Fully 300 miles of ditches have been plowed in looking for ledges and a dozen wells have been sunk. Shafts are plenty and prospect holes puncture the great flat in all directions. Water and fuel are plenty. The gold-bearing rock is of a refractory nature that cyanide will work. A phosphate ledge has been opened in the Salt Wells country that will prove valuable for fertilizer. It assays similar to the phosphate mines in South Carolina, and only needs slight treatment to be ready for fertilizing the soil.

Madera.

(Special Correspondence).—The Contentment mine, adjoining the Standard, near Central Station, is reported to have been sold to Eastern parties for \$10,000. Representatives of the purchasers are on the ground making estimates for required machinery. The former owners of this mine were Lindsay, Schroeder, Keller & Patton. It has been worked for many years, though no great depth has been attained.

Reed & Harris recently put up a 2-stamp mill at their mine near the junction of Pine Gold with the San Joaquin. They have heretofore worked their ore by means of an arrastra with satisfactory results. The ore is cheaply extracted by means of a tunnel run on the vein.

Gold, June 26th, '98.

Mariposa.

Boston News Bureau: There is no truth in the report that Merced is likely to call a \$3 assessment in a few weeks. It will be many weeks before Merced calls any further assessment, if indeed any is called at all.

Mono.

At the cyanide plant of Cain & Co. at Lundy seventeen men are at work.

Bridgeport Chronicle: On the 1st of June the Standard Con. Co., Bodie, had on hand \$52,162.53, and the Syndicate \$971.02. Standard Con. stock is quoted at \$1.50 a share, the highest mining stock on the market.

Nevada.

The Odin M. Co. will sink a shaft on the Wait for the Wagon claim, near Nevada City, to a depth of 500 feet.

A new hoisting plant capable of 1500 feet depth is in course of construction on the old Telegraph mine, adjoining the W. Y. O. D. The galloways frame will be 70 feet high, and a self-dumping skid weighing a ton and a half will be used. The Telegraph was worked for some time by a local company, but was hampered by litigation. The property was since purchased by the W. Y. O. D., who are developing it.

The Polar Star mine at Dutch Flat has closed for the season for lack of water. The yield for the short mining season has been very satisfactory.

Work has begun on the Metropolitan mine at Moore's Flat.

Herald: The owners of the La Belle mine

near Nevada City contemplate putting in an air compressor.—The St. Gotbard Co. is preparing to build a mill on the Delbi mine at North Columbia.

Union: The new 10-stamp mill at the Red-dick gravel mine, near Nevada City, will probably be in running order by the 4th of July.—Opie, Hart & Garland have arranged with the owners to extract 300 tons of ore from the old Peabody mine near Grass Valley.

—The Stanford mine, near Nevada City, is yielding some high-grade ore. The property is bonded from Judge Caldwell by J. H. Neff and associates.—The Spanish Ranch mine, near Nevada City, has a ledge 25 feet wide and the ore assays \$7.50 per ton.

Placer.

The superintendent of the Pioneer gold mine says that a vein in the north tunnel recently opened in the 50-foot drift from the winze, 12 inches wide, has widened to 18 inches.

Sentinel: Development work is still in progress at the Bellevue quartz mine in Ophir district. The shaft is down 150 feet and drifts have been run. The ledge is increasing in width. Six men are engaged. Twenty tons of ore will be crushed at a custom mill. Little work has been done on this property, except the sinking of the shaft and some small prospect drifts, yet the gold taken out has reached the sum of \$10,354.26.—The French Co., which bonded the W. C. Ralston mining property at Long Canyon, has thirty men at work. The company has about twelve miles of channel, which they will work on a large scale.—In the Jubilee quartz mine near Auburn the ledge averages about 2 feet. The shaft is down 100 feet. Ten tons of ore yielded over \$300.

San Bernardino.

Tracy N. Stebbins, near Victor, made a cleanup of \$600 in two weeks with an arrastra.

San Diego.

The Credit Commutation Co. of Sioux City, Iowa, claims to be the owner of 186 notes made by D. T. Hedges of the Golden Cross M. & M. Co. for amounts aggregating \$873,500, and alleges that Hedges is a three-fifths owner of the properties of the Golden Cross M. Co., worth \$1,000,000; that an interest in the properties in question has been sold to the Free Gold M. Co. of Nevada, and that they are about to pay for them, thus enabling Hedges to prevent its being applied to the payment of the notes in question. Plaintiff asks judgment for 68 per cent of \$873,500, with interest on the whole amount.

Shasta.

T. F. McAvoy has bought the Price quartz mine, near Middletown. The property has a ledge 15 inches wide of good values and a 5-stamp mill.—The Slatonis & McCall quartz mines in Dog Creek district were sold to Kirk & Co. for \$3500.—P. Schmitzer, in a recent cleanup in his placer mine near French Gulch, found a piece of gold weighing \$117.—Pennsylvania capitalists have leased 300 acres of land near Delta upon which they are opening a slate quarry. The Shasta County Democrat says they will employ 300 men.—Devinney & Gray, near Whiskeytown, are running a steam arrastra on ore from their Kanaka mine.

Courier: The new 10-stamp mill at the Spanish mine, near Shasta, is approaching completion. The ledges are opened by tunnels, and the ore is of good grade.

Sierra.

(Special Correspondence).—Gravel mining in this section continues in a measure, but is hampered by the scarcity of water. The companies operating on a large scale are taking out gravel and storing it, awaiting the next season's rain and snows.

The Bald Mountain Con., formerly the South Fork gravel mine, at Forest City, comprises 800 acres. The tunnel has reached nearly 3000 feet, tapping the channel at 2400. The gravel is brought in a train of twelve cars drawn by a locomotive. The amount of gravel stored begins to assume the appearance of a small mountain.

The Hanley drift gravel mine, near Alleghany, is outputting gravel in quantity, but has no facility for washing it the present season. This mine has a main tunnel 2400 feet long, with additional tunnels and drifts amounting to 2500 feet. The channel is tapped at 1500 feet. The average pay streak is about 3 feet depth, across the width of the channel.

The Crueses G. M. Co. are preparing to put in an air compressor. Their purchase of the Hope mine recently makes their holdings quite extensive. They will work the Hope from the Plumbago mine and abandon for the present at the least the extensive tunnels run on the Alleghany side of the ridge by the Howard Co.

The Rock Placer, Mabel Mertz, Meehan and Tangway properties are producing good gravel and storing it.

The Kenton quartz mine, an abandoned property, upon which work was resumed a few months ago, is making good progress. The old works have been cleaned and retimbered and the tunnel is being driven rapidly.

At the old Gold Bluff mine, near Downieville, an Eastern company is pushing work under the supervision of J. W. Copeland.

The resumption of work on old time quartz properties and the successful working of ancient river channels has taken goodly proportions in this county, and the year would be quite prosperous were it not for the scarcity of water, which necessitates a long wait for returns from capital invested as work continues.

Downieville, June 27th, '98.

Enterprise: The Gold Bluff mine, near Downieville, has received the first load of machinery of the new air compressor plant. The Gold Bluff mine has a good record as a gold producer, having followed the pay chute

down from the croppings over 1000 feet with good rock all the way.

Slakiyon.

Building ditch and flumes at the Aromas mine on Salmon river is progressing.

The American Bar Co. at Klamath river has thirty-eight men employed.—The Greenhorn blue gravel mine continues to yield good pay, with plenty of water pumped from bed-rock for washing. The company has a payroll of over \$3000 a month.—The Yreka Co., running a tunnel near Yreka, has reached 420 feet.

The Pacific mine, at mouth of Humburg creek, Klamath river, has been unwatered.

The San Francisco Co., working the old Eastlick and Wright hydraulic claims at Oro Fino, is making a clean-up; the claim has been worked with improved elevators.

Journal: Jilison & Co. are meeting with success in their quartz mine near Henley. With their 5-stamp mill they clean up from \$1200 to \$1500 every two days; they blasted a bunch of quartz that contained \$3400. They are putting in five more stamps.

Reporter: Mining men from Oakland are examining the old Cummings ledge near Calistobans. They will sink a shaft and, if favorable, they will erect a 10-stamp mill.—On the Bouvier mine on Slide creek the improvements are being rushed to completion.—On the Hazel G. M. Co.'s property near Hornbrook, comprising five claims, fifty men are employed.—The Badger M. Co. has a tunnel 100 feet on the ledge, which is 2 feet wide. Ten men are employed. Steam is being substituted for water power.

News: The Blue Jay mine near Yreka is bonded for \$3500 by a Portland company. The development work consists of two tunnels, the lower one tapping the vein at a depth of 250 feet.—It is reported that the California Queen mine in Cottonwood district, has made another rich strike.

Trinity.

The Postlethwaite dredger at Poker Bar, Trinity river, will shortly be ready for operation. It has a capacity of 105 cubic yards per hour, and was built by the Risdon Iron Works of San Francisco.

The Altona mine at Cinnabar shipped 100 flasks of quicksilver.

R. Curin, representing the Pioneer M. Co. of Montana, will prospect the river bed in the vicinity of the Given ranch, near Weaver-ville, with a view of putting in a dredger. The company have already located a good many acres of the river bed.—The Bighouse mine, near Trinity Center, is pushing development work on a ledge of fair value.—C. A. Hamilton, representing Col. Dan Burns, has been examining property at New River. He has secured an option on the Mountain Boomer mine and will begin operations on it.—The Sherwood mine is taking out ore.

Journal: The company that purchased the Chloride mines, near Dedrick, have made their second payment on the property. They will build a mill.

Tuolumne.

At the Trio mine near Tuttle-town one shaft is down 200 and the other 550 feet. Drifts and crosscuts have been run 586 feet. There are three claims in the group.—At the Rawhide near Sonora the forty stamps and obliteration works are in constant operation. The depth of the mine is 1400 feet.—The Rappahannock has reached a depth of 1100 feet. The Alameda at Table mountain is driving to 800 feet depth. The ore body is said to be 140 to 160 feet wide. There are over 5000 tons of ore on the dump. The new 20-stamp mill will be ready to start about the middle of August.

—The Bawn mine near Robinson's Ferry has reached 300 feet depth. The shaft will be sunk 1000 feet.

Union-Democrat: Many improvements are being made at the Confidence mine at Confidence, and the twenty stamps are running on a good quality of ore.—The men working the Wainwright claim on Bald mountain in seven weeks have taken out \$7000, an average of a \$1000 pocket per week.—The shaft at the Bown mine near Robinson's Ferry is down 285 feet.—A company headed by J. W. Richards has commenced to develop the Uncle Sam mine near Quartz. It is proposed to drive a shaft on the vein at least 200 feet.

At the Dreisam the shaft is down 280 feet, with 3 feet of high grade ore in the bottom. The percentage of sulphurets grows heavier with depth and much of the concentrates assay over \$2000 per ton. The new mill is running.—In the Hope mine near Sonora work is confined to stoping from the 280-foot level. The rock is good grade.—The crosscut tunnel on La Estrella has been driven 310 feet.

Independent: In the Bell mine at Tuttle-town the shaft is down 400 feet and a drift has been run 80 feet. The ledge has been crosscut, showing nearly 60 feet of vein matter, but no hanging wall was found. The object was to run the level 400 feet.—At the Tarrula mine, Table mountain, the shaft is 350 feet deep. An extensive ore body is discovered. Eighteen men are employed.

Mother Lode: Good sulphurets ore is taken from the Pine Tree mine near Jamestown.—The Kendall mine near Stent is being examined by capitalists from Philadelphia to get it on bond. The ledge in the shaft is about 11 feet wide, charged with sulphurets.

Yuba.

The Abbie M. Co. of Rackerby have purchased the Johnson or Abbie mine. They had it bonded and have been developing it for over a year.

NEVADA.

The De Lamar mine is said to yield a profit of \$300,000 a month.—The mills at Cherry Creek are supplying the smelter with 500 tons of concentrates each month, and at present 100 tons of copper matte are being sent monthly to the refinery at Chicago.

Six teams are hauling sulphur for the Humboldt Sulphur Co. from their mines at Rabbit

Hole to Humboldt station. — M. Cutting brought from his mine in Silver Star district, Esmeralda county, seventeen ounces of gold worth \$13 per ounce. This represents the output from seven tons of ore.

The gross earnings of the Dexter gold mine at Tuscara for June is figured at \$28,000.

At Austin the Austin M. Co. started its mill last week on ores from its mines there.

Work has been temporarily suspended on the Comstock and Brunswick lodes, the Con. Cal. & Virginia, Ophir, Mexican, Utah Con., Best & Belcher, Gould & Curry and Savage. The shut down is said to be for economical reasons and to devise plans for the future. Efforts are being made tending to the adoption of a plan to drain the lower levels of the Comstock and resume deep mining.

Official letters report in the Savage during the past week the main west drift on the 130-foot level was cleaned out and repaired a distance of 10 feet; total length 607 feet. Brunswick lode.—The joint north drift on the Sutor tunnel level has been cleaned out to the face, a distance of 14 feet, and advanced 9 feet; total length 152 feet; face in hard porphyry.

In the Belcher mine, on the 1000-foot level, the east crosscut from the main north lateral drift is now out 155 feet, 10 feet having been made during the week; the face shows porphyry. There have been hoisted and stored in the ore house at the mine during the week twenty-three mining carloads of ore, the average top car sample of which shows an assay value of \$18.92 per ton. The gross yield in bullion from the 281 tons and 630 pounds of ore worked by the Brunswick mill during the week was \$3290.28, the average battery sample of the same being \$17.55 per ton.

The yield of the Overman mine for the week ending June 25 amounted to nine carloads of ore, valued at \$28.36 per ton. They have shipped 69 tons and 1490 pounds of accumulated ore to the Brunswick mill for reduction. The ore extracted during the week was taken from the workings above the north drift on the 900-foot level.

In the Potosi mine, the west crosscut on the south line, tunnel level, has been advanced during the week and is now out 178 feet; the face shows porphyry and low grade quartz. In the croppings on the 40-foot level they are raising on the pay streak of ore. Have shipped to the Nevada mill during the week 17 tons and 1000 pounds of ore, the wagon samples assaying as follows: Gold, \$13.75, and 13.37 ounces silver per ton.

Lyons County Times: M. & J. King deposited in the Carson Mint 101 ounces of gold, the proceeds from their Dayton mine during the first three weeks in June. —Williams & Armstrong, of Silver City had a crushing of forty tons of ore from the Vivian mine which gave them between \$25 and \$30 per ton. —The Nevada G. M. Co., operating at Lone, employs 250 men. —The Dexter M. Co. of Tuscara made a shipment of gold bars and auro-cyanides. It is estimated that the gross earning for June will reach \$30,000.

OREGON.

In the Red Boy mine near Baker City the tunnel has reached 1300 feet. It cuts two ledges, one 12 and the other 90 feet wide. There are 1200 tons of ore on the dump.

At the Baisley-Elkhorn, near Baker City, sinking continues and the mill products are satisfactory.

The ditch of the Steam Beer mine, near Leland, is finished. It will carry 3000 inches of water and will enable the company to run their mine for six months in the year.

L. C. Basye of Missouri Flat district, near Jacksonville, unearthed a pocket from which he obtained \$600.

Baker City Democrat: Near Malheur City three men took out \$1600 with hand mortars in twelve days. The ledge upon which they are working is 2 feet wide.

WASHINGTON.

The '97 product of gold and silver in the State of Washington was 21,752,504 ounces of gold and 242,720.15 ounces of silver, valued at \$449,664.15 and \$313,898.46 respectively.

The Deer Trail mine, at Cedar Canyon, is shipping thirty tons per day. —Fifty teams are reported engaged in hauling ore from the Legal Tender and Deer Trail No. 2 to Davenport. —The Blue Grouse, a copper property, will start up as soon as the wagon road from Springdale to Cedar Canyon is completed.

The Chloride & Rattler, near Fruitlands, has begun work. It is a silver-lead property and yields \$27.50 in gold. —The War Eagle mine at Meyers creek, on the reservation, has a vein 10 feet wide, with a 2-foot pay streak, which assays \$50.90 in gold, silver and lead. The ore outside of the pay streak is said to assay \$3.50 in all values.

Near Springdale the Copper G. Co. has discovered a vein of good grade copper and gold ore. —Cottrell & Co. are developing a 30-inch wide ledge that assays \$16.85 in gold.

The tunnel in the San Poil at Republic has reached 290 feet. A ledge of fair grade ore has been found. An air compressor has been installed and work is pushed. —The Black Tail has found a good ore body and is driving development work day and night. —In the Tenderfoot the tunnel has reached 100 feet.

—The Bonanza mine, near Bossburg, is shipping sixty carloads of ore per month. A vein over 20 feet wide is exposed in the 400-foot level of the Bonanza. It averages about 35 per cent lead, 30 per cent iron and from 10 to 15 ounces in silver.

BRITISH COLUMBIA.

At Spokane G. Turner has secured a temporary injunction restraining the sale of Le Roi mine at Rossland, recently sold to the British American corporation for \$3,000,000 by a majority of the American board of directors. Turner claims the pooling agreement existing between certain large stockholders was violated by the action of the trustees, whose acts, he claims, were without authority.

C. H. Macintosh, the British Columbian managing director of the purchasing company,

says such action will not succeed in invalidating the purchase. He further says: "Had we been eager first to buy the Le Roi, we should have found it necessary to give most, if not all, of the \$5,000,000 originally asked by the vendors, instead of the \$3,000,000 at which we purchased, and, after buying the Le Roi, have found the prices of surrounding properties which we have since bought heavily raised against us, certainly to much higher figures than those at which we obtained them in the end, the vendors knowing as we know, or that several such properties can be worked best and most cheaply in conjunction with the Le Roi."

A Seattle, Wash., dispatch dated June 28th says: "The sale of the Le Roi gold mine for \$3,000,000 to a British syndicate has been successfully blocked by Senator Turner."

Probably there is not a section in the mineral act of British Columbia that is so often misinterpreted as is Section 16. It relates to the staking of claims, and has been generally interpreted as meaning that, where there is no timber and posts are hard to get, the locator may use stone monuments to mark the boundary lines of his claim. Such is not the case; and as this is a most important point, it might be well to refer to the act itself. Section 16 says: "A mineral claim shall be marked by two legal posts. * * * The locator shall also place a legal post at the point where he has found rock in place." Then follows the paragraph relating to stone monuments, but it refers only to the case of running the blaze line, and makes no allowance whatever for the same to be used as legal posts. It reads: "When a claim has been located the holder shall immediately mark the line between posts Nos. 1 and 2 so that it can be distinctly seen; by blazing trees and cutting underbrush and in a locality where there is neither timber nor underbrush he shall set legal posts or erect monuments of earth or rock not less than 3 feet high and 2 feet in diameter at base, so that such line can be distinctly seen."

The War Eagle, at Rossland, which has been shipping 105 tons per day to the smelter, announces that it will increase its shipments to 200 tons per day.

M. Willis, managing director of the Channe M. Co., at Fairview, closed a deal with an English company for some of the company's property for \$130,000. —A shipment of ore from the Providence mine to the smelter went \$51.89 to the ton.

At the Second Relief mine, near Erie, there are 400 tons of ore ready for shipment as soon as the road is completed to Erie. This has been taken out in the ordinary process of development, and there are large bodies of ore blocked out ready for stoping.

The Whitewater mine at Whitewater has started another tunnel. The owners have ordered a concentrator of 100 tons capacity. About sixty men are working in the mine. In a few months they will probably employ 300 men. The company is shipping three or four cars a week.

The B. C. mine, near Grand Forks, has from 3000 to 4000 tons of shipping ore on the dump. The B. C. is at present shut down for the purpose of installing a 10-drill compressor plant to replace a 3-drill plant that was found to be too small. —The Ardelston has just installed a 7 drill plant on its copper property.

—The Old Ironsides in the Wellington camp is to put in a 7-drill compressor and the Stem-winder a like plant.

The Joint group near Nelson has a 5-foot ledge of galena, and assays run \$120 in gold and silver to the ton. The owners have given Eastern capitalists an option on the Joint for \$55,000. —The last car of ore shipped from the Vancouver mine, Slocan, went 263 ounces silver per ton and 55.9 per cent lead, giving returns of \$4724.52 for the car. Over eighty men are employed in the mine. —During May there were cleared at the Kaslo custom house 1,860,857 pounds of ore, valued at \$67,735, containing 696,086 pounds of lead and 94,052 ounces of silver.

The recent tests indicate that the average proportion of iron and silica all over the mine is almost precisely equal, or, to be exact, each ordinarily runs about 28 per cent. As is needless to point out, this makes an admirable smelting ore, although in the case of the War Eagle the excess of iron and silica is just now of great importance, as it has a flat rate for the treatment of its ores at Trail, whether the iron runs in excess or in the minority.

In pursuing the tests as to the character of the ore, a sample was taken at the 625-foot level, across the full width of the vein, which at that time measured 6½ feet, although it has since gained a foot in width. This sample returned the following results: Gold, 98 oz.; silver, 2.9 oz.; copper, 4.3 per cent; iron, 34.5 per cent; silica, 22.5 per cent. The remainder of the ore was made up of sulphur and iron carbonates. This sample, showing as it does an excess of 12 per cent in iron, might be taken as indicating that the iron proportion increases with depth, but J. B. Hastings, the Mgr. of the mine, recalls the fact that a recent shipment of ore from the very grass roots gave an iron excess of 24 per cent, so that he does not place any particular faith in the high excess obtained from the recent sample taken from the 625-foot level, which is at present the deepest working in the property, and he inclines to the belief that the question of depth will be of no importance with reference to the silicious nature of the ores of the camp.

Beaton Bros. sold the Jenny Lind and Golden Gate claims at Ymir to McMillen & Merced, who represent English capital, for \$7000 cash. The ore runs high in gold and copper. Beaton Bros. have done considerable development work on it.

Rossland Miner: Timbering the shaft of the Le Roi mine, Rossland, between the 600-foot and 700-foot levels will be finished within a week. Re-timbering the shaft between the 500-foot and 600-foot levels is also under way. The installation of the trackway to the 700 will be completed in a fortnight, when com-

munication will be established to the bottom of the mine. It is expected that the whole property will be in shape for the resumption of active operations by the last of July or the first of August. The 350-foot level is being extended and some good ore is met. The 600 is now 666 feet west of the main shaft. The ore there continues good. —The Nickel Plate and the Great Western are putting in a 12-drill compressor. This is the largest straight-line machine in camp. —The War Eagle shipments last week amounted to 1688 tons, of which all but 208 tons went to Trail. Work is under way preparing the surface for the big galloways frame to be installed, and the timbering of the shaft is rapidly nearing completion.

Kootenaiian: The Payne mine at Kaslo closed down completely last week, and rumor has it that when operations are resumed again it will be in the hands of an entirely new crew. Mgr. McDonald returned from San Francisco, and it is said found the mine running in anything but a satisfactory manner. He at once decided upon an entire change of force.

Miner: The War Eagle at Rossland has decided to increase its shipments to 200 tons daily. —The Hall Mines, through Supt. M. S. Davys, has taken a \$65,000 bond on the True Blue, the copper proposition discovered near Kaslo. The ore showings assay an average value of 15 per cent copper and some gold and silver.

Rossland Miner: The mooted question as to whether or not Rossland ores become with depth more silicious and consequently harder to melt, seems to have been answered by the tests of the War Eagle rock recently made at the Trail smelter. The analyses indicate that while of course individual lots vary widely in the proportionate amount of iron and silica, yet on the whole there is practically no difference in the silicious percentage, whether the sample comes from the grass roots or from the 625-foot level, which at present is the deepest working in the mine.

ALASKA.

(Special Correspondence). —The American G. M. Co. has bought all the Nowell G. M. Co.'s property, including the Basin gravel mine and Sheep Creek quartz mines. At Sheep Creek in a short time the mills will be running.

The Berners Bay mines are not yet in operation. Supt. Willis Nowell has gone to the mines and states that he will start up at once.

The Jualin is running steadily on good ore. Schneider & Danow are opening up a good prospect near the Jualin. Fifty tons of machinery is now on the ground.

Mullin M. & Mfg. Co. are running a cross-cut to tap the Ivahoe. They will put up a tram and mill as soon as the ledge is struck.

Prospectors have brought in some rich gold ore from the head of Eagle river. The extent of the discovery is not yet known.

W. H. Hile is running an 1800-foot tunnel to open up the Last Chance gravel basin above Juneau. A four-drill compressor has been set up and will be in operation this week.

Treadwell is busy putting up buildings for the additional 500 stamps.

A report came out yesterday that in all probability no boats would be able to get up the Yukon this season; the water is very low. The winter has been mild all over this country.

Three flat-bottom stern-wheel steamers are at the dock. They intend going to St. Michaels.

Two thousand head of cattle have been sent into Dawson over the Dalton trail by way of Pyramid Harbor.

Juneau, June 13th, '98.

A recent arrival at Dyea from Dawson, sent out by one of the trading companies, says that in consequence of the low water in the Yukon river it is doubtful that any river steamers will be able to reach Dawson this year.

Upon the strength of this report the Canadian authorities have placed in force an order making it compulsory that all persons going down the river shall have 600 pounds of provisions, otherwise they will not be allowed to proceed.

L. S. Smith, returning from Bennett, says that real estate in the coast cities has dropped fully 75 per cent in value. About four miles of the Skaguay-Lake Bennett railway were completed, and grading for five miles beyond was ready for the rails. About 500 men are at work on the road. Wages are from \$2.50 to \$3.50 per day. It is expected that the road will be completed to Lake Bennett by the end of July. The builders intend to continue the road to Dawson.

THE KLONDIKE.

A passenger returning from Dawson says not in five years has there been so light a snowfall in the interior of Alaska as last winter. Mountain peaks which are usually covered with snow are bare. Melted snow and ice make the greater volume of the water of the Yukon river, and this year it is lower than it has been in a long time, and the amount of snow will not produce water enough to raise it more than a few inches at most. Bars and points jutting from the shore at the bends of the river are far out of water. At the present stage of the water none of the boats at St. Michael can come up the river. They would never get over the flats. The exceptionally mild winter accounts for the light snowfall. Prospectors who have been in the Yukon basin for years say they have never seen the river so low at this time of year and so little snow. There is a good deal of uneasiness on this account in Dawson and up in the mining camps. There is said to be disappointment among claim holders generally in regard to the clean-up. The amount is less than was anticipated; and while some hope it may reach \$20,000,000, many will be surprised if the total clean-up exceeds \$5,000,000. There is not a man in the Klondike region who owns a claim that does not want to sell. Thousands

of men are going into the Yukon country who have nothing but the bitterest disappointment ahead of them.

Alaska Miner: The amalgamation of the three tramway companies at Chilkoot pass is an important event in the stirring incidents of the Klondike rush. The entire complexion of travel over the pass was changed when these aerial roads were built. For years past the miners and Indians laboriously climbed the precipitous heights of Chilkoot, each carrying upon his back a heavy load; but this year a great change occurred, making that mode of travel quite unnecessary. So cheaply and expeditiously was the freight carried, that prices in force last year were reduced to a point within the bounds of reason. Now all three companies will be operated under one management, reducing expenses very considerably. Amalgamation leads to economy in the working and establishes a community of interest and prevents friction. The service on the Chilkoot will be better than ever.

IDAHO.

(Special Correspondence). —The following figures show the tonnage of concentrates per month shipped from the various silver-lead mines of the Coeur d'Alenes, Idaho, being in round numbers:

| | Tons. |
|--------------------------|-------|
| Bunker Hill and Sullivan | 2400 |
| Last Chance | 600 |
| Mammoth | 500 |
| Helena and Frisco | 1500 |
| Con. Tiger and Poorman | 1800 |
| Standard | 1200 |

The ores are concentrated in the ratio of three to six tons into one, the concentrates running from 55% to 60% lead and from 15 ozs. to 90 ozs. silver.

The Bunker Hill & Sullivan and the Last Chance are at Wardner. The Mammoth, Helena & Frisco, Tiger & Poorman and Standard are along the canyon from Wallace up to Burke.

The Morning and You Like group is at Mulan. This property, which lost its mill by fire last April, has a new 700-ton concentrating mill almost complete. It is equipped with heavy crushers, rolls, jigs, round tables and vanners. The new mill involves an expenditure of \$100,000. The power is water, under 900 feet pressure. A railroad runs from the mill to the mine, three miles distant. This property belongs to Larson & Greenough, and it is estimated they will ship about 2700 tons of concentrates per month when the mill starts.

The Con. Tiger & Poorman shipped 19,700 tons of concentrates in 1897. Their present mining is through a 1400-foot shaft at the 1300-foot level. The mill has a capacity of 600 tons per day. The company is putting in a new 20x60 direct-acting hoist, which will be in operation by Aug. 1st, and will materially increase their hoisting facilities.

Work in the Helena & Frisco proceeds through a 1200-foot tunnel, from which a 1000-foot shaft has been sunk. The breast of the tunnel is 600 feet from the surface in a vertical line.

The Bunker Hill & Sullivan management is driving a tunnel from the mill, near the railroad, to the mine, a distance of about two miles, which, when complete, will displace the wire-rope tramway now in use.

WASCOTT.

Wallace, Idaho, June 24th, '98.

The Pierce district, near Kendrick, has a revival in mining as a result of attention turned towards ledge work. The water supply, too, has been abundant this spring, and the placer miners are profiting by it; during the next thirty days clean-ups will be frequent. —The stamp mill of the Mascot M. & M. Co. is being taken to the old Blanket mine on Gold creek. This company has taken a bond on this mine and will begin work.

The De Lamar in May leached 2796 tons; the bullion produced from cyanide treatment was \$22,000; total product for the month, \$29,099; total expenses, \$24,063.

Boise Statesman: The New England Dredge Co. has launched its dredge on More creek at Idaho City. —The Bingham Placer Co. has begun sluicing gravel at Gibbonsville; 1800 cubic yards go through the boxes daily. —The Croesus mill at Hailey is running five stamps on an ore test. —The Checkmate Co. at Pearl has been shipping ore four months, averaging one car per week, that returned \$100 per ton in gold.

Idaho World: The case of G. W. Grayson against the heirs of T. Mootry, who was at the time of his death one of the owners of the Gold Hill mine at Quartzburg, is in court. The property was purchased by Grayson at a sale ordered by the court, and the litigation grew out of the sale. When this is settled, Mr. Grayson will begin extensive developments on the mine. It is his purpose to expend \$100,000 in development work alone. His machinery on the Virtue mine, in Baker Co., Oregon, will be moved to the Gold Hill.

UTAH.

A crosscut obliquely made on the 1100-foot level of the Silver King mine at Park City continued 400 feet in ore all the way. The opinion is that diagonally the chute is no less than 150 feet between walls. In this distance several varieties of ore are found.

The tankage capacity of the De Lamar mill at Mercur is to be doubled. So is that of the roasting plant. At present the mill has a capacity of 3500 tons. —The first payment of \$10,000 on the sale of the Argentine group of five claims at Bingham to the Boston S. Co. of Massachusetts has been made.

The Winnemucca mine at Alta at a depth of 125 feet has a 30-inch vein of galena that assays thirty ounce in silver and 50 per cent lead. —Thirty-six cars of ore were shipped from Silver City. —The Quartzite mine, near Frisco, shipped 125 sacks of ore that averaged 30 per cent copper and \$5 in gold. They have 100 tons of dump that assays 20 per cent copper, \$1 to \$5 gold and 10 ounces silver. —The Ben Harrison encountered

quartz assaying 4 per cent copper, five ounces silver and \$19.63 gold. The streak is about 13 inches thick.

The burning of the Crescent mill at Park City leaves several thousand tons of ore, belonging to the Crescent lessees, on the dump. The fire has not disturbed its metallic contents.

The Bingham Bulletin says that within a month the Julia Dean, Fortune, Conger, Weasel, Cuba, Washington and Erie mines have reported finding ore running from 10 to 40 per cent copper.

Tintic Miner: At the Centennial-Eureka the force of the mine is over 100 men. Shipments from the district for the week were eighty-three cars of ore. Seven cars of concentrates, six bars of bullion.

Mercur Mercury: Last week the first gold bars produced in the district were shipped from the Golden Gate mill. It amounted to \$43,000. Now that the experimental stage has been passed, and the method of obtaining the best results established, the mill will be run to its full capacity. Additional tanks will be put in and an addition made to the roasting plant. The mill is treating about 400 tons per day. A shipment of cyanides by the Mercur amounted to \$20,000. The Sacramento made a shipment of \$9000 worth of cyanides.

MONTANA.

A peculiar natural mineral exhibit is in the Garnet district in the Stone and Loomis placer, 300 acres on the pinnacle of a mountain 6000 feet high. A decomposed reddish material about 12 feet in depth, resting on a bedrock of granite and lime, carries about \$1 in gold to the cubic yard. A steam rocker and a steam crusher have been put in with excellent results. A steam pump will raise the water from Deep creek, enabling the work to proceed on a much larger scale. Placer deposits of this character on mountain tops are very rare, and it is thought very valuable gold quartz deposits will be found when the bedrock is thoroughly prospected.

The Colorado Co. commenced to take ore again from the lower levels of the Gagnon mine at Butte last week. It was necessary to stop work for some time on the lower levels in order to allow the retimbering of the shaft which was needed 160 feet below the 900-foot level. The timbers which had to be removed had been in place over nine years and had rotted. The work of retimbering is completed and the regular quantity of ore—nearly 500 tons daily—is hoisted and shipped to the smelter. The Gagnon is one of the old and deep mines of Butte, being over 1600 feet deep. It has been a steady producer for many years. At Clancy, in the Liverpool mine the shaft is being sunk to 600 feet depth. A 12-inch ledge of high-grade ore has been opened.

The Nugget group of mines near Twin Bridges has been sold to a Chicago company. The group consists of 210 acres, ten claims, four of which are producers. It is stated that \$14,000 worth of ore has been taken out of the Diamond Hitch, the best developed of the group. The ore is principally lead, having an assay value of from 65 to 77 per cent, but carries gold and silver. The company will build a concentrator.

The Silver Queen Fraction has been purchased by the Boston & Montana Co. for \$5000.

Bordeaux and associates are again sinking on one of the claims on the Meaderville flat. Negotiations are pending toward a sale of the G. & B. mine on the Warm Springs for \$50,000.

In his annual report President Hale relates why the Iron Mountain mine was closed down. "For many reasons we were compelled to shut down last October, having reached the limit of the capacity of our machinery for deeper working, and the directors did not think it advisable to equip the mine for deeper working, say 3000 feet, with the limited amount of cash on hand, and the many disadvantages in working at this point, and the low price of silver and lead, together with the great cost, estimated at not less than \$150,000. Besides, we would have been compelled to sink a new shaft of 1100 feet to comply with the new law requiring two escapes from mines, in case of accident, which would have required at least from four to six months, and cost not less than \$50,000." The Mayflower mine is looking better than at any period in its history. The workings are over 500 feet from the surface. Ore is being taken from two veins, both together having 10 feet of high grade ore. The average ore taken from the Mayflower this year has given returns of eight ounces gold to the ton. The Copper Jack near Clancy will, in all probability, continue sinking the shaft which was showing well when operations were suspended a few weeks ago.

Philipsburg Mail: The Con. Granite-Bi-Metallic Co. has started fifty stamps in the Bi-Metallic mill.

Butte Weekly Miner: In the large mines of Butte the regular production continues and in nearly all the properties more or less development work is going on. At the Alice group in Walkerville the output has varied very little for the past year. The low price of silver has threatened the properties several times with a shut down, but by good management and working some of the mines on the tribute system, dividends have been paid during the year. M. Finlen is producing copper ore from the Ramsdel-Parrot mine which he has under lease from the Anaconda Co. The Montana O. P. Co., is producing several hundred tons of ore daily from the Karus mine and a force working on developments at the Cora, the Parnell, the Nippur and the Big Bonanza near Walkerville.

Sinking is going on at the East Gray Rock with machines. Great difficulty is experienced from water, which has retarded the work. At the 1400 drifting is being done by machine and a raise put through to 1200. Sinking has begun at the Leonard shaft. At the West Colusa sinking has been discontinued tempo-

rarily. Two raises are being put through from 400 to 300, with machines. The Mountain View has reached the 1400 level and crosscutting begun.

SOUTH DAKOTA.

Gibbs & Cook have bonded thirty-three claims in the Ruby Basin district, near Deadwood, and commenced development.

WYOMING.

At Grand Encampment the Kurtz & Chatterton mine has a 1300-foot tunnel that cuts four veins at from 250 to 400 feet depth. It is low-grade ore and requires a reduction plant. The Golden Eagle is operated by an English company who contemplate building a mill. The Sandstone mine is a productive property and handles twenty tons of ore daily with a fair profit.

One hundred pounds of ore sent to Denver as a sample from the Jones & Williams mine at Grand Encampment gave returns of \$55 per ton.

MISSOURI.

The Age of Steel reports "a mining boom" in the zinc mining districts of Missouri. "Companies old and new are rejoicing in rich finds and advancing prices. Old properties, once abandoned for sundry reasons, are being reworked, and the outlook for the mining interests of the State is brighter than for some time. It is stated that during the last twenty-two weeks there has been a heavy excess running into the millions of tons of zinc ore output than during the corresponding period of last year. Those best competent to speak of the situation are jubilant over its prospects. Ore deposits are in rich and paying quantities and exhaustion is practically out of sight."

MICHIGAN.

It is stated that every cent difference in the price of refined copper means nearly \$1,000,000 per annum to the Calumet & Hecla Co. The calendar year's productions of this company in pounds of refined copper have been as follows: 1892, 56,495,211; 1893, 60,427,913; 1894, 73,944,889; 1895, 79,485,599; 1896, 85,552,756; 1897, 86,809,206. The 1898 product should be 90,000,000 pounds, and before the end of the century this company should be making 100,000,000 pounds of refined copper per annum.

The three shafts on the Osceola lode look promising, but the company will probably not begin production from them for a long time to come. The Black Hills shaft, in the southernmost part of the mine, is now over 3000 feet in depth on the incline of the lode. It does not yet pay for itself. It is within a few feet of the Osceola line, and developments in it are not favorable to the hopes that Osceola yet may find good ground on the Calumet lode.

Copper shares are not largely held abroad, as is the general impression. But a few hundred shares of Calumet & Hecla are held in Europe. The other mining companies have practically no stock owned in Europe. The Canadian holdings of the leading copper shares amount at present market values to between \$1,000,000 and \$2,000,000, the larger part being held in Montreal. In this country 70 per cent of the total holdings are in New England, Boston and its suburbs having fully 60 per cent of the entire American equity. New York has several millions invested in lake coppers, although scarcely as much as might be expected. Detroit has several millions invested and is rapidly increasing its holdings, particularly in the newer properties. Houghton county, Mich., has \$10,000,000 to \$12,000,000 invested in the local mines.

COLORADO.

On July 1st the cost of ore treatment was advanced from 50 cents to \$3 per ton on all smelting ores, according to character of ore. The result will undoubtedly be the suspension of work on many low grade properties that are working on close margins. It is unfortunate this raise should occur at a time when miners are feeling the effect of the depressed condition of the industry.

BOULDER COUNTY.

The Enterprise mine at Eldora made a shipment of a carload of high grade ore. The Ironsides has about thirty tons of good shipping ore. The Revenge is in a vein 4 feet wide, which runs \$36 to the ton, and a streak running eighteen ounces of gold. The Antietam has 120 tons of ore ready for shipment. The Independent has considerable ore to be shipped. The vein is 9 feet wide, about 5 feet of smelting ore that will run from \$25 to \$50 per ton, and 4 feet of mill dirt that will run from \$8 to \$10 per ton.

DOLORES COUNTY.

C. Smith is shipping iron ore from the Magnet, near Rico.

EL PASO COUNTY.

Telegraph: The Portland, Cripple Creek, sent a greater tonnage to the mills and smelters in June than any month of the year. The production is running about 125 tons per day. The Parsons lease on the Shurtleff at a depth of 60 feet has a 5-foot vein that will average two and a half ounces. Ten tons of ore were sent out from the Scott lease. W. S. Stratton's Summit stamp mill at Gillett has been leased, after having been closed down several months. The company that has taken the plant claims to have a new method for the treatment of low grade ores that will reduce stamp mill charges in the Cripple Creek district. The lease on the Mary McKinney Co.'s Republic shipped forty tons of ore averaging between three and four ounces to the ton. Since the first day of this month the output has been a little over 500 tons. A carload of two-ounce ore was sent from the Little May mine. It has a daily output of from twelve to fifteen tons. The Britannia tunnel at 196 feet struck a phonolite dyke which had values of \$23 per ton. The tunnel has 460 feet depth and will have 1500 feet when completed. The dyke is said

to be between 500 and 600 feet wide. The Ironclad mine is producing forty tons of ore a week. At the Lillie the screenings carry from six to eleven ounces, while the ore classed as medium grade runs \$85. The low grade returns from \$17.50 to \$30. The lessees of the Pinto are producing about eighty tons of ore weekly. The Bock lease on the Vindicator is producing three cars per week. Whiteside & Stark are sending out a similar amount from the Anna J. claim of the Vindicator Co. The Keith lease on the Wallace, another Vindicator property, is shipping \$60 ore.

EAGLE COUNTY.

The dumps of the Black Iron mine at Gilman, are being worked by F. F. Harrington. The ore is oxide and sulphide and there is enough in sight to keep work going for years.

GUNNISON COUNTY.

The first carload of ore has been shipped from the Sylvanite, and four or five more carloads are ready for shipment.

HINSDALE COUNTY.

The Golden Fleece M. Co. is about ready to push the big tunnel into Hotchkiss mountain. It is a development, transportation and drainage tunnel and will open at depth and drain some of the leads that have been located at the surface.

LAKE COUNTY.

The Small Hopes Mining Co., Leadville, is shipping 250 tons daily of iron sulphide. This tonnage comes from the deepest workings in the district. The Cyclops and Marion lease outputs are divided between the home and valley smelters. Two hundred and thirty men on the payroll. After five years of idleness work will resume in the A. Y. and Minnie mine at Leadville. The mine will be unwatered and necessary repairs made before putting the miners to work. The company owns a 100-ton concentrating mill. The deepest workings are about 400 feet. The Vindicator Mining Co. are shipping two carloads of gold ore daily from the Golden Eagle.

The Penn M. & L. Co., at Leadville, are daily shipping eight wagon loads of gold quartz to the sampler. There are three shafts on the property. Operations have begun by the Home M. Co. to complete arrangements at the Bon Air and the Penrose mines so that this company will be able to start its pumps the first of July and in conjunction with the Leadville Pumping Association assist in draining the downtown territory, known as the Leadville basin. The Resurrection is shipping over 3500 tons of ore per month. Lessees on the Maid of Erin are shipping 2000 tons per month. The Penn M. Co. is shipping 1700 tons a month.

GILPIN COUNTY.

Ore from the Pearce mine, Central City, plated \$10 to \$12.50 per ton and gave \$10 in concentrates. The smelter ore paid from \$50 to \$80 per ton. The vein is 12 feet wide.

The last shipments of ore from Black Hawk were twenty-four cars—nearly 400 tons. The Geiger continues to make a daily shipment of five tons of ore. The ore body is 7 feet wide. The Seventy-six G. M. & M. Co., operating the First Centennial property in Chase gulch, shipped 2085 tons of mill ore during May. At a depth of 325 feet in the Dike mine, levels are being run on ore which will average in mill lots about \$10 per ton.

SAGUACHE COUNTY.

The Creede Co-operative Co.'s mill at Creede is to be enlarged to double its present capacity. The sulphur mines at Creede are in operation. The sulphur mines on Trout creek have been bonded to J. H. Frambach for \$10,000. L. J. Chapman has charge and has a number of men at work. O. Soward is working a force on his sulphur claims.

SAN JUAN COUNTY.

A new ore chute has been found in the Ridgway mine, near Silverton, that assays \$180 in gold and \$350 in silver. The old workings continue to output high-grade ore.

SAN MIGUEL COUNTY.

The Belle-Champion mine, in the Saw Pit district, is shipping a carload of ore daily and receiving satisfactory returns. The Smuggler-Union is working on ore accumulated last winter. They are shipping their smelting ore, besides treating 200 tons of milling ore per day in the company mill. The Alta, in Gold King basin, is daily shipping ore to the mill at Ophir, besides shipping four carloads of smelting ore per week. The output of the mine is giving satisfactory returns.

The Hector Tunnel and Construction Co., near Telluride, is still driving the Ophir tunnel in Middle basin. This tunnel has been in course of construction for almost two years, and has reached a distance of about 2500 feet.

NEW MEXICO.

New Mexican: Lime rock and iron ore are received by the North smelter at Cerrillos. The Ortiz mine at Dolores has cut the wages of employees from 12 to 20 per cent. The Rosedale stamp mill at San Marcial has started up again. The Santa Fe branch from San Jose to Santa Rita is completed and ore is being shipped over the new line.

Silver City Enterprise: At the Atlantic mine, Pinos Altos, the shaft has been retimbered. It is down 450 feet. Sinking will be resumed. On the fourth level there is considerable ore; the fifth level has ore ready for extraction. The shaft will probably be carried to a depth of 800 feet and levels run, before arrangements are made for reduction of ore.

Davidson & Bell, lessees of the Golden Giant mine and mill, have thirty men employed. Drifting and stoping is being done at a depth of 450 feet. Enough ore is being extracted to keep the mill running. At the Santa Rita copper mines about 1200 tons of iron ore is shipped every month. The output of copper ore last month was 610 tons; some of this ran 39 per cent copper in carload lots. The new branch of the A. T. & S. F. R. R.,

three and a half miles in length, from San Jose to Santa Rita, has been completed.

ARIZONA.

The Table Mountain mine in Pinal county has 6000 tons of copper ore on the dump, on which the smelter will be started. The company has two furnaces and employs seventy-five men. The Grand Reef mines, owned by John W. Mackay, comprise twelve claims. Development work is confined to the Grand Reef. The work in the tunnels, shafts, etc., is all done by machines, operated by compressed air. Expert machine men are employed and are paid from \$3 to \$5 a day and the shift is ten hours. There are about forty men at work. A tunnel has been run 800 feet, at the end of which is a shaft 400 feet deep.

Phoenix Republican: A 3-foot strike of good ore has been made in the Erie mine, Mohave county. Six 200-pound bars of bullion from the White Hills Co. of Mohave county were shipped to San Francisco. The tailings of the Mammoth mine in Pinal county have been purchased by N. Anderson. He will erect a 120-ton plant. The pumping machinery at the Bonavita placer mines is ready for the completion of the pipe line, a distance of twenty miles.

Allison & Wicks shipped from the Fresnal properties, near Tucson, sixty sacks of ore that yielded \$109 gold and 271 ounces in silver. The Trinity mine, near Wickenburg, was bought at probate sale by the Golden Wave M. Co. for \$2000.

LOWER CALIFORNIA.

The steam pump is in position at the Valladares placers and they soon expect to be scraping the bedrock of the creek. The pump is a centrifugal machine and has a capacity of 50,000 gallons of water per hour. Steam is furnished from a 25 H. P. boiler and the water will be raised anywhere between 30 and 50 feet, the depth of the gravel to bedrock not having yet been determined. There have been many attempts to work these placers, but all have failed from the fact that considerable water seeped through the sands of the Valladares and interfered to such an extent that mining was impossible. To overcome this difficulty it has been necessary to build a road sixty miles over a rough and broken country to the coast and move in heavy machinery.

At the Viznaga mine in Mexican gulch, near Alamo, the 10-stamp mill is running on good ore. Between the 200 and 300-foot levels a large body of ore has been struck. Also in the drift between the 75 and 150-foot levels a crosscut shows the ledge to be 14 feet. The Viznaga Co. is now employing forty men. The Aurora mill is running on ore from the San Vicente mine. The owners have taken out sixty tons. The Moctezuma is running three shifts and taking out good quartz.

MEXICO.

At the mine of the Colorado Ures Co., in the Ures district, Sonora, a body of gold ore has been found. There are about 150 men employed and the cyanide plant is in operation, with good results.

The Reina mine, near Cusihuiaichic, has 400 miners at work. In the last year it produced \$500,000 silver and has an equal amount in ore on the dump. The Santa Elena, in the same district, ships from forty to seventy-five cars of ore daily.

H. C. Bacora in charge of the mill on the Mines of Gold at Bachochi writes that the plant is about to close down. The Parisian owners are said to have expended \$300,000 on the property. The San Jose de Garcia Co. at Sinaloa is crushing ore that yield \$30 per ton in gold. The mines of the State of San Luis Potosi for last year produced precious metals to the value of \$4,600,000, being \$1,300,000 more than the previous year.

AUSTRALIA.

Last year the Australasian colonies increased their production of gold, as compared with 1896, by \$2,000,000, but they exported \$2,000,000 more than they produced, the exports amounting to \$13,000,000, against a production of \$11,000,000. This year the production promises to be \$13,000,000, but so far the export has been on a larger scale, for in a little over four months about \$5½ millions sterling have been shipped, inclusive of direct exports from Queensland and New Zealand.

The deepest shaft in Western Australia is on the Golden Link mine, Kalgoolie, its depth being 552 feet. It is being sunk to 600 feet.

The gold yield of Victoria for the five months ending June 1st amounted to 303,921 ounces—an increase of 5995 ounces over the corresponding period of 1897.

TASMANIA.

The total ore treated by the Mount Lyell Co. furnaces for the half year ending March 31, amount to 62,808 tons, of which 56,007 tons were taken from open faces and 6861 tons from stopes. The average assay of the ore was; Copper, 4.25 per cent; silver, 3.69 ounces; and gold, 0.177 ounce per ton of the wet weight of the ore. Six furnaces are at work. The converter plant treated 4558 tons of matte for an out-turn of 2363 tons of high grade blister copper, and it is being duplicated to provide for the output of five additional smelters that are already arranged for. The net profits for the half year were \$84,350, and two dividends of 4s each were paid out of this sum.

SOUTH AFRICA.

To visit any of the mines, says the South African Mining Journal, is most heartening. There you see work in full swing, profits being maintained only by the closest labor and the closest economy; you see new machinery, and hear of fresh plans for effecting a small saving. There is an air of cheerfulness everywhere, since from manager to drill-boy every one has little to care for save his allotted task. And yet the scrip that represents the value of these mines is depressed; directors are at a loss; bold schemes involving the investment of money are impossible; the men who depend on the industry are impoverished. Every one is cruelly pinched, and all hope is blighted by the shadow of grave emergencies.

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.

THIS ::

Two-Stamp Self-Contained Battery

IS DESIGNED BY

THE UNION IRON WORKS

Expressly for Prospecting Work.

It was awarded First Prize at the recent Mechanics' and Manufacturers' Fair, where it was in daily operation, crushing ores from various mines throughout the State.

Weight of stamps, 275 pounds each; capacity of battery, determined by actual work, 200 pounds per hour, through a No. 7 slot-punched screen.

Entire battery weighs about 3000 pounds; heaviest piece, mortar, weighing 1200 pounds.

Can be taken apart and transported to any locality.

PROSPECTING BATTERY.

ERASTUS S. BENNETT, President.

SAMUEL DEXTER HAYWARD, Vice-President.

D. F. COOPER, Secretary.

PLACER MINING

WITH THE Improved Electrical Shovel or Dredge and Amalgamator,

— MANUFACTURED BY —

**THE BENNETT
Amalgamator Manufacturing Co.,
DENVER, COLO., U. S. A.**

— WORKS: —

**Cor. 36th and Wazee Streets,
DENVER, COLO.**

Eastern and Foreign Office, Johnstone Building, No. 30
Broad Street, New York, N. Y.
SAMUEL DEXTER HAYWARD, Manager.
Cable Address, "Bennetts," Denver or New York.
Sole Manufacturers (except for the State of Colorado)
under all the Patents Covering the "Bennett
Amalgamator" Plants.

These plants, being the outcome of many years of evolutionary experiment in the field of their actual operation, are constructed in the most thoroughly substantial and workmanlike manner, of the best material the market affords, with a view to their maximum efficiency, strength and durability; the operating portions almost exclusively of steel, to gauge, and therefore interchangeable, and having been thoroughly tested as to all points, under widely varying conditions, are fully warranted to perform as indicated in the following table:

FOR "GULCH," "BAR" AND "HILL" DIGGINGS.

| Number | Capacity in cubic yards of gravel per 24-hour day. | Total operating cost in cents per cubic yard of gravel. | Miners' inches water required where water is scarce or abundant. | Approximate total weight inclusive of power plants. | |
|--------|--|---|--|---|-------------------------|
| 1... | 2500 | 2 to 4 | 25 to 150 | 150 tons | Single operating plant |
| 2... | 5000 | 2 to 3 | 50 to 300 | 200 tons | Duplex operating plant |
| 3... | 7500 | 2 to 2½ | 75 to 450 | 300 tons | Triplex operating plant |

SWAMP AND RIVER-BED PLANTS.

| Number | Capacity in cubic yards of gravel per 24-hour day. | Total operating cost in cents per cubic yard of gravel. | Miners' inches water required where water is scarce or abundant. | Approximate total weight inclusive of power plants. | |
|--------|--|---|--|---|--------------------|
| 4... | 2500 | 2 to 4 | Barge | 250 tons | Single amalgamator |
| 5... | 5000 | 2 to 3 | Barge | 325 tons | Duplex amalgamator |

In general terms it may be said these plants consist of the electrically operated dredge and amalgamator, mounted either on steel barges or river-bed mining, or steel-bodied cars for "gulch," "bar" and "hill diggings," together with the necessary power plants for their operation. Several operating plants, either in close proximity or scattered over a large district, may be operated from a single power station, which may be situated at any convenient point within a radius of a few miles, at railroad depot or where water power can be utilized. The river plants, complete in themselves (each barge containing its own power), are made single or duplex; any suitable number of either can be operated on a river, each independently working its allotted section from surface to bedrock, and rim-rock to rim-rock. All these plants are built with a view to easy transportation, in "knock-down" shape over ordinary mountain roads, and, on special order, the size and weight of separate parts may be still further reduced. In the foregoing table the figure representing the smaller quantity of water required applies to cases where, for any reason, it is desirable or necessary to use the water over and over. The water required may be taken from below the placer, thus obviating the necessity of long ditches, etc. Since these plants neatly pile their debris on the cleaned-up bedrock of the ground worked, they may be said to create their own dump, and hence are enabled to successfully operate on flat ground, or where ordinary dumping facilities are lacking. This peculiarity also renders them independent of "debris laws." The wonderful perfection with which these plants extract the finest, microscopic particles, such as are held in suspension in water, or, when dry, ascend in a gentle current of air, constituting in bulk a perfectly impalpable powder (send for samples), renders them particularly valuable and indispensable in cases where, owing to the fineness of the golden particles, very rich mines are unavailable for profitable working by the hydraulic or sluice processes.

All plants are furnished with duplicate parts and wearing pieces to cover at least two years' constant use, while the life of the plant is conservatively placed at twenty-five years' active service. For further information address as above.

"Union" Hoist.

The above cut represents our 10 h. p. Double Cylinder Engine of latest type, and Hoist combined on strong iron base. This hoist is designed to raise one ton 25 feet per minute from an inclined shaft, or 1500 pounds at the same speed vertical lift. The drum will hold over 600 feet of 3/4-inch cable. The outfit weighs 3500 pounds.

THE UNION GAS ENGINE CO.

— BUILD THE —

"Union" Gas Engines,

Which use either Manufactured or Natural Gas, Ordinary Stove Gasoline (Naphtha or Benzine), Distillate or Kerosene.

STATIONARY ENGINES for All Kinds of Work, Built in Sizes from 3 to 200 h. p.

"UNION" COMBINED HOISTS in Sizes from 2 to 40 h. p.

"UNION" COMBINED COMPRESSORS — 20, 30, 40 h. p.

HOISTS and COMPRESSORS Can Be Built in Larger Sizes to Order.

"UNION" MARINE ENGINES, 4 to 200 h. p., of Single, Double and Four-Cylinder Types.

TEN YEARS' EXPERIENCE Building Gas and Oil Engines.

"UNION" ENGINES Are in Use All Over the United States.

"UNION" ENGINES Are Simple, Durable and Economical.

Established 1860. ENGINEERS AND MANUFACTURERS OF

Ore Milling and Smelting Equipments.

We beg to call attention to our

High Speed Special Rolls

as being the most efficient and the most economical machine for fine dry crushing ever placed upon the market. The rolls having

NARROW FACES and LARGE DIAMETERS

can be fed evenly over the whole width of faces with certainty, and hence the faces or crushing surfaces are easily kept true. Descriptive pamphlet on application.

HIGH SPEED SPECIAL ROLLS, WITHOUT HOUSING.

Double rope tramways are acknowledged to be superior to those of the single rope type, and any one contemplating the erection of a tramway should investigate the merits of the . . .

THE ONLY AUTOMATIC TRAMWAY BUILT.

FINLAYSON PATENT AUTOMATIC WIRE ROPE TRAMWAY.

In this system the cost of transportation is brought below any figure heretofore reached. Its tonnage capacity is unsurpassed. Further information on application.

THE GUTTA PERCHA AND RUBBER M'F'G CO.

30 and 32 FREMONT ST., SAN FRANCISCO.

Spadone's Concentrator Belts. Patented.

The "SPADONE" Curved Edge Concentrator Belt is attracting much attention among mining men, its merits appealing to the millman of practical experience.

Illustration (Fig. 1.) shows a cross-section, and (Fig. 2.) shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. We avoid this Mechanical Defect by our Spadone Curved Edge. Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

FIG. 1.

FIG. 2.

We shall be pleased to quote you also on Water, Air Drill, Steam, Suction and Fire HOSE, RUBBER BELTING and RUBBER PACKING. Correspondence Solicited.

BAKER & HAMILTON,

HIGH GRADE

Engines, Boilers,

ICE MACHINES, MINING TOOLS, Etc., Etc.

THIS CUT represents one of our improved **DOUBLE CYLINDER STEAM HOISTING ENGINES**. We have them in sizes from 12 H. P. up (with or without boilers). They are constructed with the greatest care by engineers familiar with the best previous practice. They come with sectional iron frames, reversible link motions, etc., consequently can be shipped knocked down, in pieces suitable for transportation over difficult roads and trails.

We also have them with the Single Engines from 6 H. P. up; Boiler and Engine contained on same frame.

These outfits are built in the most substantial manner possible, and on the most approved principles. We recommend them in every particular.

SALT LAKE, UTAH.

THE OREGON SHORT LINE RAILROAD.

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that have ever been discovered. In Cripple Creek in 1893 there were a few prospectors looking over the hills; in 1895 the camp turned out over \$5,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. For elegantly illustrated descriptive books, free, of mines in Colorado send to

W. J. SHOTWELL, - - - General Agent,
314 California St., San Francisco, Cal.
S. K. HOOPER,

Colorado's Mining Industry.

There have been a number of interesting and instructive pamphlets issued on this subject by the U. P. D. & G. Ry. and the South Park Line, Colorado's progressive railroads, which reach the principal mining centers of this vast mineral section. They are all carefully and conservatively prepared and will be mailed upon receipt of request and necessary postage. The various publications are as follows:

La Belle Gold Fields, 2c.
Gunnison Gold Belt, 2c.
Hints to Prospectors, 2c.
Ward Mining District, 1c.
Pine Creek, 1c.
Puma, 1c.
Breckenridge Gold Belt, 1c.

Address
T. E. FISHER,
Asst. General Passenger Agent,
DENVER, COLO. Room B.

La Sal Mountains.

NEW, RICH MINING DISTRICT.

Best reached by way of the
Rio Grande Western Railway
from CISCO or THOMPSONS stations.

Daily stage from Thompsons to Moab—here outfits can be secured at very reasonable rates—thence by wagon or saddle to LA SAL MOUNTAINS, twenty miles distant.

The formation is igneous and all the metamorphic rocks abound. Veins of quartz, quartzite, porphyry, granite and spar are well defined. The district promises a great future.

Send to F. A. WADLEIGH, Salt Lake City, for pamphlet.

Assaying Gold Silver Ores.

THIRD EDITION JUST OUT.

A Standard Work.

By C. H. AARON.

This work is written by an experienced metallurgist who has devoted many years to assaying and refining precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores," etc.) that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:—Preface; Introduction; Impurities; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of cupellation; Weighing of Bead; Firing; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests of Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 126 12-mo pages, with illustrations, well bound in cloth; 1896. Price \$1.00 postpaid. Sold by the Mining and Scientific Press, 330 Market St., San Francisco.

THE BEST BOOKS

Are always the CHEAPEST. All the latest and best works on Mining, Metallurgical, Electrical and kindred subjects can always be obtained through the office of the MINING AND SCIENTIFIC PRESS. Below will be found a list of standard books in their various lines. If you do not find what you want in it, send for catalogue and price list of Standard Mining Works and Scientific Publications.

MINING AND SCIENTIFIC PRESS,

330 Market Street, San Francisco, Cal.

Assaying.—Part I—Gold and Silver Ores.

Third edition; Just Out. Rewritten and Improved by the Author, C. H. Aaron. Embraces 180 12-mo pages, with illustrations; well bound in cloth; 1896. Price, postpaid, \$1 00

Assaying.—Parts II & III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.

Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid, \$1 75

Prospector's Field Book and Guide.

By H. S. Osborn.....\$1 50

Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.

Second edition. By Guido Kuestel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. Price, postpaid, \$3 00

Modern Copper Smelting.

By Edward Dyer Peters, Jr. Eighth edition. Rewritten and enlarged. Profusely illustrated, \$5 00

Practical Treatise on Hydraulic Mining.

By Aug. J. Bowie, Jr. On the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. Price, postpaid, \$5 00

Practical Hydraulics.

A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulas, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, \$2 00

The Explorer's and Assayers' Companion.

A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid, \$6 00

The Metallurgy of Gold.

By M. Eliasler. Profusely illustrated, \$5 00

Cyanide Processes for Gold and Silver Ores.

By E. B. Wilson, E. M. 12mo., cloth, \$1 50

Quartz Operator's Handbook.

By P. M. Randall, \$2 00

Skeleton Mining Report.

Or great practical value to miners and mine owners in making a comprehensive report on mining properties. Useful and convenient to mining engineers as a field notebook. Price, postpaid, \$5 00

Stamp Milling of Gold Ores.

By T. A. Rickard, M. E. An actual record of milling practice in this and other countries. Deals with the erection and management of mills, and contains many helpful suggestions to those interested in the extraction of gold from its ores. Well illustrated. Cloth. Price, postpaid, \$2 50

Miners' Pocketbook.

A reference book for miners, mine surveyors, geologists, mineralogists, millmen, assayers and metallurgists. By C. G. Warnford Lock. 472 pages, illustrated, flexible leather, \$5 00

Manual of Mining.

For the use of Mining Engineers and Technical Schools. Treating of Preparatory and Exploratory Work, Methods of Mining, Hoisting Machinery, Pumping, Ventilation Shafts, Tunnels, Blasting, Timbering, etc., etc. By Prof. Magnus C. Ihlenburg, E. M., Ph. D. Third, revised and enlarged, edition. 548 pages, 8vo., cloth, \$4 00

The Lixiviation of Silver Ores with Hyposulphite Solutions.

With special reference to the Russell Process. Second edition. Completely revised. By Carl A. Stetefeldt. Price, bound in cloth, \$5 00

Prospecting IN THE Klondike.

WILFLEY CONCENTRATOR.

PRICE \$450 F. O. B. SAN FRANCISCO.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work.
SEND FOR CIRCULARS.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U.S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U.S. Patents since 1872. All worthy inventions patented through Dewey, Strong & Co.'s Patent Agency will have the benefit of a description in the Mining and Scientific Press. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U.S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

Market Reports.

The Markets.

SAN FRANCISCO, June 30, 1898.

SILVER.—London, 27½d; New York, 59¼; San Francisco, 59¼, nominal; Mexican dollars, 46½.

COPPER.—Lake, 11¼@12. London reports say that consumers of copper still hold aloof, and transactions that take place in refined sorts are mostly of a dealing character. American electrolytic copper is offered for export at about the parity of prices ruling East. Other advices from London report that copper has been pressed for sale at a loss of about 8s 9d per ton, the lower prices, however, causing an active demand.

LEAD.—New York quotes 4.00 asked; local, pipe, 5¼@6c; sheet, 6¼@7c; pig, 5¼c.

IRON.—American, soft, \$20 and \$22 per ton. SPELTER.—5 and 5½.

TIN.—Plate, American, \$3.50; English, to arrive, \$4.25; Pig 16¼c.

ANTIMONY.—9½, 10.

NAILS.—List per keg: No. 20 to 60d, wire, \$2.25; cut, \$2.00; 10 to 20d, wire, \$2.30; cut, \$2.05; 8d, wire, \$2.35; cut, \$2.10; 6 and 7d, wire, \$2.45; cut, \$2.20; 4 and 5d, wire, \$2.55; cut, \$2.30; 3d, wire, \$2.70; cut, \$2.45; 2d, wire, \$2.95; cut, \$2.70. In carload lots, 10c per keg less.

QUICKSILVER.—Domestic, \$42.50@43; export, \$38.

POWDER.—F. o. b., San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15¼c; less than one ton, 17¼c. No. 1* 60%, carload lots, 13¼c; less than one ton, 15¼c. No. 1** 50%, carload lots, 11¼c; less than one ton, 13¼c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9¼c; less than one ton, 11¼c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2 per keg.

FUSE.—Triple tape, \$5.10 per 1000 feet; double tape, \$4.35; single tape, \$3.45; Hemp, \$3; Cement No. 2, \$4.35; Cement No. 1, \$3.45.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9.

COAL.—San Francisco coast, yard prices: Wellington, \$8.00; Coos Bay, \$5.00; Seattle, 6.00; Southfield, 7.50.

Cargo lots, Eastern and foreign: Wallsend, \$7.50; Cumberland, \$10.25; Brynbo, 7.50; Cannel, 10.00; Pennsylvania, bd., 14.00; Welsh Anthracite, 12.50; Scotch, 8.00; Rock Springs, 7.60.

CHEMICALS.—Cyanide of potassium is quoted jobbing, 35@38¼c per lb.; carloads, 29¼c; sulphuric acid, 2c per lb. for 60%; nitric acid, 7¼c in carboys; soda ash, \$1.60 per 100 lbs. 58%; hyposulphite of soda, 2¼c per lb.; blue vitriol, 4¼c per lb.; borax, refined, 5@6c per lb.; chlorate of potash, 9¼@10c.

LUMBER.—Retail: Pine, ordinary sizes, \$17@18.50; redwood, No. 1, \$18@20; No. 2, \$16@18.

Russia, Japan and India are all buying gold in the London open market; the price for bar gold has risen to 77s 10½d@77s 11d, about as high as has been paid in recent years. Russia is still steadily carrying out the preliminaries necessary to the completion of its plans for a restoration of the currency to a gold basis.

To-morrow the war revenue law goes into effect. Following are its provisions relating to blank paper, in effect July 1, 1898: Domestic items payable on sight or on demand—Bank check, draft, or certificate of deposit not drawing interest, or order for the payment of any sum of money, drawn upon or issued by any bank or trust company, or any person or persons, companies or corporations, 2 cents. Domestic items payable otherwise than at sight or on demand—Bill of exchange, draft, certificate of deposit drawing interest, or order for the payment of any sum of money, 2 cents per \$100 or fraction thereof. Promissory notes—2 cents for each \$100 or fraction thereof. Foreign items payable in the United States—Bill of exchange, or order for the payment of any sum of money, drawn in any foreign country and payable in the United States, 2 cents per \$100 or fraction thereof. Foreign items drawn in the United States, payable in foreign countries—Bill of exchange, letter of credit, telegraphic transfer, if drawn in sets of two or more, 2 cents per \$100 or fraction thereof; for each bill of the set, if drawn singly, 4 cents per \$100 or fraction thereof.

Penalties—Issuing unstamped paper: Fine up to \$200, or in some cases imprisonment up to six months, or both, and the unstamped instrument be held invalid. Accepting or paying unstamped paper: Fine up to \$200.

Note—Adhesive stamps on documents must be cancelled at time of issue by writing or stamping thereon the initials of the party affixing same, and date.

The Postoffice Department has prepared a circular directing postmasters to increase the price for money orders by a sum equal to the stamp required. This will obviate the use of 30,000,000 stamps each year.

On and after July 1 private mailing cards bearing written or printed messages, advertisements or illustrations may be sent through the domestic mails at the postage rate of one cent each, payable in stamps affixed by the sender. For private mailing cards sent to foreign countries the letter rate of two cents will be required. Postmaster Montague, in charge of the general postoffice has been notified by the Postoffice Department at Washington of the following regulations governing the use of these cards: Only the superscription, which may include the occupation of business of the person addressed, will be allowable on the face of the cards. The cards must not exceed 3¼ by 5½ inches in dimensions, and in quality must be substanti-

ally the same as the Government postal cards. Upon the addressed side the words "Private mailing card—authorized by Act of Congress of May 19, 1898," must be printed; in the upper right-hand corner there should be an oblong diagram with the words "Place a one-cent stamp here," and in the lower left-hand corner the words "This side is exclusively for the address." In color the cards may be white, cream, light gray or light buff.

Mining Share Market.

SAN FRANCISCO, June 30, 1898.

The figures of the week for "business" furnish sufficient comment on the present fortunes of the Comstock. At quoted stock prices the whole lode would sell for one-fifth of one of the old time monthly dividends of one of the mines on the famous lode. The boards have "adjourned" till after the 4th. There seems little inducement for further sessions.

This, the last day of the fiscal year, is low-water mark with the Comstock stocks. Never before in their history has so stagnant a state of affairs existed. With no war tax it would be unusually dull, but the revenue law which goes into effect to-morrow takes nearly all life out of the situation. The tax on "transfers," referred to editorially in last week's issue, is a "deadener," so far as actual transfers of stock are concerned. After to-morrow there will be a Government charge of two cents upon the stock books of a mining company, (or any other corporation) and two cents for each transfer on a par or "face" value of each \$100. This in addition to the \$50 required of the mining broker. Stocks, bonds, debentures and certificates of indebtedness issued after to-morrow will pay five cents on each \$100 of face value. In this regard it is to be noted that "face" value is interpreted to mean par value, what the certificate of stock ostensibly calls for.

Commercial Paragraphs.

F. M. SMITH contemplates building in Alameda Co., Cal., a large boric acid and sulphuric acid factory near the refinery on Alameda Point.

Among recent shipments the M. C. Bullock Manufacturing Co. report the following: One 4-foot, two 6-foot and one 8-foot Champion mine ventilating fans to Japan; one Detector diamond drill, with complete outfit to bore and remove cores to a depth of 2500 feet,

shipped to Montana; one Chief diamond core drill, with complete outfit for removing a 2-inch core to a depth of 1500 feet, for use in the Siberian gold mines of Russia; to the Metropolitan Iron and Land Co. of Ironwood, Michigan, a high-class first-motion hoisting plant, consisting of a pair of 24x48 Bullock-Corliss engines, with two cast iron shell drums 3 feet diameter by 9 feet face, each winding 2075 feet of 1½-inch steel wire rope. This plant is fitted with an auxiliary steam-actuated handling motion, containing all recent refinements and improvements, to insure safety and ease of manipulation.

Joshua Hendy Machine Works, San Francisco, Cal.

Office and Salesroom.....38 to 44 Fremont Street.

Works.....Cros. Bay, Kearny and Francisco Streets.

DOUBLE CYLINDER SINGLE DRUM HOIST.

THE above form of Hoist has certain features of construction which make it superior to all others. It is mounted on a single solid base, with standboard for the operator. The engines are reversible link-motion and the drum is fitted with post-brakes and helical teeth, which assure quick and safe operation. The design is compact and superior and the construction strong and substantial. We furnish them either with or without clutch pinions. The above cut illustrates an 8½ inch by 10 inch. Other sizes in stock and built to order.

TUTTHILL WATER WHEEL.

The Best Jet Wheel in the Market,
BARRING NONE.

Wheels, Buckets and Nozzles Designed to Suit Special Requirements. When Head and Conditions Are Given. Theoretically as Well as Practically Perfect. Highest Efficiency Guaranteed.

We have a Sensitive, Simple Governor that will positively regulate speed of wheel. Specially adapted for electric railway and lighting plants.

LEON GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, near Winchester, Riverside County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 10th day of May, 1898, an assessment (No. 1) of 1½ cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 7, fifth floor, Mills building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of June, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 25th day of July, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors
K. L. CHENEY, Secretary.
Office—Room 7, fifth floor, Mills building, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors of the Leon Gold Mining Co., the day of delinquency of the above assessment is postponed to July 31st, 1898, and the day of sale to MONDAY, August 8th, 1898.

K. L. CHENEY, Secretary.
Office—Room 7, fifth floor, Mills building, San Francisco, California.

AMERICAN MINING ENGINEER, in the employ of a wealthy syndicate, wants a good gold, silver, lead or copper property in the Western States or Northern Mexico, upon which considerable development work has been done. Will take up on lease and bond or put up a plant for an interest; or, if considerable ore is in sight, will buy on equitable basis. Send full particulars of mine, amount of water, timber and fuel available, transportation facilities, standard wages, etc.

Address A. N., Mining and Scientific Press.

Position Wanted by a

Mining Engineer.

Am thorough assayer and amalgamator and can fill any position about mine or mill. Have complete set of engineering instruments and assay outfit. At present am manager of go a mine in California and will be at liberty about July 10th. All letters from present employers. Address P. L., care Mining and Scientific Press.

Position Wanted as

AMALGAMATOR.

By a man who has had eighteen years' practical experience. Is willing to go anywhere and is not afraid of work. Can give the best of references. Address "K. L.", care of this office, by mail or telegraph.

WANTED.

A First-Class Diamond Drill Operator.

Address:
THE MOUNTAIN COPPER COMPANY, LTD.,
Keswick, Cal.

FOR SALE.

HOISTING MACHINERY, ENGINE, BLACKSMITH OUTFIT, 120 ACRES MINING PROPERTY, U. S. Patent. Some Development.

Will sell as a whole, or in parts to suit. Address J. F. HOLLING, 113 Crocker Bldg., San Francisco.

FOR SALE.

2 Five-Foot Huntington Mills;
1 Forty Horse Power Engine;
1 Gates Rock Breaker;
1 Challenge Feeder;
100 Square Feet of Silvered Copper Plates, Shafting, Pulleys and Belting.

All complete and as good as new. For particulars, address D. H. JACKSON, Placerville, Cal.

Lunkenheimer's "Handy" Gate and "Lever Throttle" Valves

"HANDY."

Are unequalled in places where a quick acting valve is required. The "Handy" for 75 lbs. pressure and the "Lever Throttle" for 175 lbs. The "Handy" is made in sizes ranging from ½" to 4" in brass; 2" to 8" in iron, brass mounted; 1" to 8" in all iron. The "Lever Throttle" in brass from 1" to 4"; in iron, brass mounted, 2" to 8"; in all iron, 1" to 8". Both styles in screwed ends only. Simple, practical and low priced. Specify Lunkenheimer's "Handy" or "Lever Throttle" and get the best. Supplied by dealers. Catalogue free for the asking.

THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.

It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

SUPT. OFFICE WILDMAN GOLD MINING COMPANY, }
SUTTER CREEK, AMADOR CO., CAL., Feb 23, 1897. }
MR. JAS. S. BROWNELL, 132 Market St., San Francisco, Cal.—DEAR SIR: Replying to your favor of the 18th inst., will say that in the two mills operated by this company we have nineteen of your Patent Lip flange concentrator belts in use; some of them have been in constant use for the past two years and have given entire satisfaction. I know of no better flange for a side shake machine.

Yours truly,

JOHN ROSS JR., Superintendent.

MR. J. S. BROWNELL, San Francisco, Cal.—DEAR SIR: For some years we have used three different styles of belts on our Frue vanner at the Mexican mill, and for smooth working and endurance the Brownell Patent Lip flange belt has proved its superiority over all others, and I unhesitatingly recommend it to all who are using Frue machines.

Yours truly,

EUGENE MAY, Foreman.

Our Fleet at Santiago de Cuba.

Present interest centers in the operations of the American army and navy at Santiago de Cuba. So far the navy had carried off all the honors of the war. The 14,000 mile trip of the San Francisco built battleship Oregon has rung around the world, solving one naval problem. Capt. Sigsbee of Maine fame has partially solved another in his successful action with the Spanish torpedo boat Terror, and the main squadron in command of Capt. W. T. Sampson, acting admiral, has made new naval history before

heating surface of 32,958 square feet. On her trial trip the New York averaged twenty-one knots. At the conclusion of the trial the forward engines were uncoupled and the vessel run for eight hours under two engines and four boilers, logging sixteen knots per hour.

The New York is a good type of the American armored cruisers, the "light cavalry of the navy," and has borne brave part in the movements that resulted last Sunday in the annihilation of the Spanish fleet at Santiago. Such vessels as the New York combine the speed of the cruiser with the offensive

and a few inches from the bottom is a port or opening, communicating with the jacket space. The cylinder below the piston is filled with liquid, for which the jacket forms a reservoir, and above both the piston and the water level in the jacket are air spaces with free communications between them. The head strikes the rock on the die before the cylinder has completed its downward stroke, so that, at the end of the stroke of the cylinder, the bottom of the piston is above the port in the side of the cylinder, and the liquid flows in. As the cylinder returns on its upward stroke, the liquid is squeezed

ENGINES OF THE "NEW YORK," FLAGSHIP OF CAPTAIN SAMPSON.

Santiago. Herewith is a good line engraving of the engines of his flagship the New York. She was launched in 1892. Her length is 380 feet 6 inches over all and beam 64 feet 10 inches. At mean draught of about 23 feet her displacement is 8150 tons. She is one the best cruisers afloat, being heavily armored and able to maintain a speed of 20 knots. The engines are triple-expansion, arranged in sets of two, one pair to each screw of the twin. The illustration shows the four machines in perspective. The cylinders are 42 inches in height (stroke). The high pressures are 32 inches in diameter, intermediate 46 inches and low 70 inches. Piston valves are used exclusively, two to a cylinder except the high pressures which have only one each. The bed plates are cast steel and the piston rods and crank shafts are of mild steel. Each engine is in a watertight compartment.

Steam is supplied from six double-ended main boilers and two single-ended auxiliary boilers, with a

and defensive power of the battleship and will be prominent factors in the new naval era now opening.

Morison's New Stamp Mill.

A gravity stamp mill by D. B. Morison retains almost every detail of a modern mill except the cam and tappet.

The feature of the Morison high-speed mill as claimed is, that it will give from 130 to 150 drops per minute as compared with the 85 to 95 of the ordinary slow drop cam mill, and will work with a 1500-pound stamp head as smoothly as with one of 400 pounds.

On the top of the king posts is a crank shaft with cranks at equal angles, each of which is provided with a connecting rod jointed to a cylinder, so that as the crank revolves the cylinder moves up and down. Within the cylinder is a deep solid plug or piston, the rod of which passes through the cylinder bottom, and constitutes a stem to which the stamp head is attached. A jacket surrounds the cylinder,

through the port from the cylinder into the jacket space, overcoming the resistance of the weight, until, when the bottom of the piston closes the port, no more liquid can escape and any further upward movement of the cylinder will raise the stamp head on an incompressible liquid buffer. The blow causes a rebound of the head, and, while rising therefrom, the liquid "pick-up" catches the weight.

When the cylinder and the stamp head have completed the up-stroke, the cylinder descends, under the control of the crank so that while the lifting of the stamp is controlled by the crank, the falling and the crushing effect are due to gravity assisted by the friction of the driven cylinder. The wearing away of the shoes and dies is provided for by several ports in the inside of the cylinder about 1½ inches below each other, so that when the shoes and dies have worn down to that extent all that is necessary is to unscrew the plug. The quick knapping blow in the Morison mill granulates rather than pulverizes.

Another Supreme Court Decision.

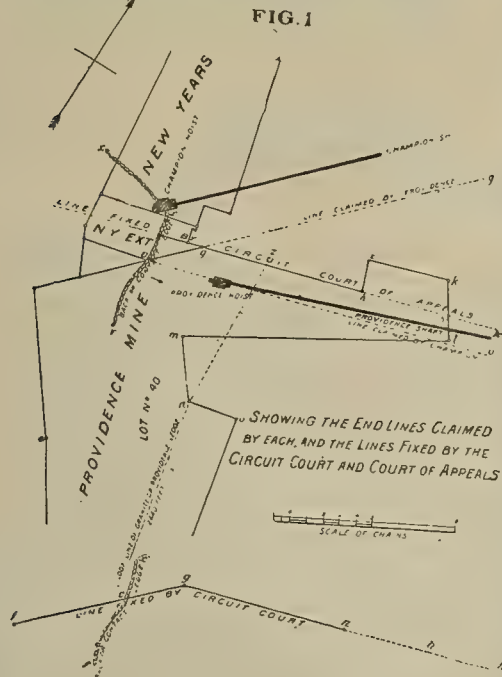

Of equal importance with the U. S. Supreme Court decision in the Del Monte-Last Chance case, published in full in last week's issue, is the decision from our highest American tribunal in the following case, which will be for permanent reference by mining men everywhere as final settlement of the questions raised.

The case was A. Walrath, appellant, vs. the Champion Mining Co., and was on appeal from the U. S. Circuit Court of Appeals for the 9th Circuit. The whole matter was reviewed in the issue of June 11th, '98, and the decision given in full, from which appeal was made. Illustrations were also published in that issue of the ground in controversy. Additional illustrations have since been engraved, and are presented herewith for the better understanding of the accompanying full text of this final adjudication of the case, which, it is believed, definitely determines a question not heretofore decided by the court of last resort.

Austin Walrath, Appellant, } Appeal from the United States
vs. } Circuit Court of Appeals for the
The Champion Mining Company. } Ninth Circuit.

This action, brought in the Superior Court of Nevada County, California, involves title to a triangular shaped section of what is known as the "Contact," "Ural" or "Back" ledge of gold-bearing ore, situated in the same county, claimed by appellant to be a portion of the Providence mine, to which complainant has title through a patent from the United States, and by appellee, a corporation, to be a part of the New Years Extension mine owned by it.

The relative situation of the two properties and the portion of the ledge in controversy is shown by the following Figure No. 1, the disputed section being contained between the lines thereon marked "Line claimed by Providence" and "Line claimed by Champion."

The figures marked "New Years" and "New Years Extension" represent the surface of the mining properties owned by defendant, while that marked "Providence mine" represents the surface of the patented ground of the plaintiff. The action was brought May 24, 1892, to recover \$300,000 damages

for ore extracted from the ledge and carried away by the defendant, and for an injunction against further trespasses thereon.

Upon motion of appellee the action was removed to the United States Circuit Court, as involving a Federal question, where the complainant recast his pleadings so as to separate the action into a bill in equity, upon which the action is now proceeding, and an action at law for the damages alleged.

The suit in equity was tried in the Circuit Court and decided mainly in favor of the appellee.

From this decree the appellant appealed to the Court of Appeals for the Ninth Circuit, where it was modified, and, as modified, affirmed.

The appellant now brings the case to this court upon writ of error from the Court of Appeals.

The appellant's title is designated as follows: In 1857, under the miners' rules and customs then in force, thirty-one locators located thirty-one hundred feet of the Providence or Granite lode. By mesne conveyances the title to this location became vested in the Providence Gold and Silver Mining Company, and on April 28, 1871, that company obtained a patent to thirty-one hundred feet of the lode and for surface ground as described in the patent.

The title thus granted to the Providence Gold and Silver Mining Company was, before the commencement of this suit, vested in the appellant.

The ledge, as granted by the patent, extends thirty feet north of the north surface line of the location and some six hundred and eighty feet south of the south surface line.

The patent conveyed only the Providence ledge and the surface ground. All other ledges contained within the surface lines were expressly reserved.

It is also contended by appellants that, by the Act of Congress of May 10, 1872, exclusive possession of all the surface included within the lines of the location was granted to the owners of the Providence, together with all other ledges or ledges having their tops or apices within such surface lines. This grant, of course, included the Contact vein, subsequently discovered within said boundaries, and now constituting the bone of contention in this action.

The Contact vein is shown in the figure, and crosses the surface line, *f-g*, of the Providence location.

On September 29, 1877, the appellee and defendant, the Champion Mining Company, made a location upon the Contact vein called the New Years Extension mine. This location overlapped, both as to surface ground and lode, upon the Providence location—that is, the lode line and surface lines of the said New Years Extension extended to the south of the boundary line *f-g* of the Providence location.

The New Years Extension mine is shown in the following Figure No. 2, together with the conflict caused by the overlap, the conflicting surface portions being shaded, and showing the Contact vein passing through it.

FIG. 2

In the year 1884 the complainant and his co-owners objected to the overlap, and demanded of the Champion Mining Company that it abandon all claims to the surface and lode to the south of the Providence boundary line, above described. Thereupon, in the month of November, 1884, John Vincent, the superintendent of the defendant, the Champion Mining Company, under the authority and by the direction of the said company, relocated the New Years Extension mine by a notice of relocation, in which the fact of the overlap under the original location was particularly recited, and the lines were readjusted so as to avoid the overlap and to conform to said line *f-g* of the Providence mine, as shown on Figure 1.

In the notice of relocation the lode line was particularly described as follows: "The lode line of this claim as originally located, and which I hereby relocate, is described as follows: Commencing at a point on the northerly bank of Deer creek, which point is 60 feet S. 11 degrees 45 minutes east of the mouth of the New Years tunnel, and running thence along the line of the lode towards the N. E. corner of the Providence mill, about S. 46 degrees 15 minutes east, 200 feet, more or less, to a point and stake on the northerly line of the Providence mine, patented, designated as Mineral Lot No. 40 for the south end of said lode line."

It also contained the following statement:

"And whereas, part of this claim, as originally described and as hereby relocated, conflicts with the rights granted by letters patent of said Providence mine, said Lot No. 40, now, therefore, so much of this claim, both for lode and surface ground, as originally conflicted or now conflicts with any portion of the surface or lode claims or rights granted by said patent, is and are hereby abandoned, which portion of this claim so abandoned is described as follows: All that portion of the above described New Years Extension claim for surface and lode which lies south of the northern boundary line of said Providence mine, which runs north 43 degrees 10 minutes east, across the southeastern corner of this claim."

The New Years Extension, as relocated, is coterminous with the Providence mine on the northerly boundary line, designated as the line *f-g*, running south 43 degrees west. (Fig. 1.) That line is the only boundary between the two properties, and the only boundary of the Providence location which is crossed by the Contact ledge.

The first workings of the appellee involved no conflict with appellant. The shaft ran parallel with the Providence line, and none of the levels crossed that line until about three months before this suit was begun, when the 1000-foot level was driven across it into the ground in dispute. Subsequently the eighth and ninth levels were driven across.

The work done by the Providence was carried on through a shaft sunk on the Providence or Granite ledge, from which shaft a cross-cut was run back to the Contact vein on the 600-foot level, and another on the 1250-foot level, and much of the ground now in controversy was thereby prospected and opened up by complainant and his co-owners. (See Fig. 1.)

The claims of the respective parties will be readily understood by reference to Fig. 1, which shows the relative position of all the mining properties belonging to both, with the lines claimed by them.

The portion of the Contact vein in dispute is that upon the dip of the ledge lying between the line marked "Line claimed by Providence" and the line marked "Line claimed by Champion."

The apex of the Contact vein is represented by the dotted line *x-y*, and shows the vein as far as exposed in both the Champion and Providence ground. South of *x* the course of the vein in the Providence ground is unknown.

The line *f-g* is the same line as that designated A-B by some of the witnesses.

Upon the trial the Circuit Court held that there could be but one end line for each end of the Providence location, and that the lines *g-h* and *f-g* constituted the end lines; that such lines constituted the end lines of not only the originally discovered Providence lode, but also of every other vein that might be discovered within the surface lines of the location. But, notwithstanding this holding, in entering the decree the line *f-g* was also established as an end line of the Contact vein, but for its length only, and then that from "g" the

line *g-h*, and that line extended indefinitely eastwardly, constituted another end line for the same end of the lode, and constituted the line through which the plane determinative of all extralateral rights in the vein must be drawn.

From this decree the appellant here was allowed an appeal to the Circuit Court of Appeals.

The latter court established the line *g-h* as the sole end line of the Contact vein, and reversed the decree of the Circuit Court in so far as it fixed the line *f-g* as an end line.

As a result of this decree the complainant was not only shut out of all extralateral rights in the Contact vein north of the line *g-h*, but also of that portion of the vein lying vertically beneath the surface lines of the Providence which extend north of that line, and which are marked upon the figures as constituting the parallelogram *h-i-k-h*, which was awarded to the Champion. (See Fig. 1, showing the end line fixed by the Circuit Court and that line as subsequently fixed by the Court of Appeals, with the latter line extended in its own direction both eastwardly and westerly.)

From the judgment of the Circuit Court of Appeals the appellant has appealed to this court.

There are nine assignments of error. The first eight attack so much of the decree as establishes the line *g-h* as an end line, for the purpose of determining the extralateral right, and fails to establish the line *f-g*, and that line produced indefinitely in the direction of *g* as such end line. The last two assail so much of the decree as awards to appellee the right to pursue the vein on its downward course underneath the parallelogram *h-i-k-h*.

Mr. Justice McKenna delivered the opinion of the Court.

There are two questions presented by the assignment of errors: (1) What are the extralateral rights of the appellant on the Contact vein?

(2) Is appellant entitled to that portion of the Contact vein within the Providence boundaries which lies north of the north end line fixed by the court, and which is described upon Fig. 1 as the parallelogram bounded by the lines marked *h-i-k-h*?

(1) The appellant contends that the patent of the Providence ledge was construed as evidence of his title to thirty-one hundred feet in length of that vein. If that carrier, this carries the northern end of the ledge thirty feet beyond the line fixed by either the Circuit Court or the Circuit Court of Appeals. It was truly said at bar: "If it is not the end line of the Providence location, then certainly there is no reason for holding it to be the end line of the Contact vein."

The language of the patent is: "It being the intent and meaning of these presents to convey unto the Providence Gold and Silver Mining Company, and their successors and assigns, the said vein or lode in its entire width for the distance of thirty-one hundred (3100) feet along the course thereof."

The patent was issued under the Act of 1866, and it is necessary, therefore, to some extent to consider that Act. By it, the appellant urges, the principal thing patented was the lode, and that the northern limit of that, and hence of his rights on that was thirty feet north of the line fixed by the Circuit Court of Appeals; and hence it is further contended that as the northern and southern surface lines (*g-h* and *x-y*) did not determine or limit his right to the lode under the Act of 1866—in other words, did not become end lines—they do not become end lines upon the Contact ledge (*x-y*) acquired under the Act of 1872, but that the surface line which crosses the strike of that ledge must be held to be the end line, and the line which fixes the rights of the parties. This line is *f-g*, Fig. 1, and, if appellant is correct, determines the controversy in his favor. The extent of the right passing under the Act of 1866 has been decided by this court.

In *Mining Co. v. Tarbet*, (98 U. S. 463), known as the *Flagstaff Case*, the superficial area of the Flagstaff mine was one hundred feet wide by twenty-six hundred feet long. It lay across the lode, not with it, and the company contended, notwithstanding that, it had a right to the lode for the length of the location. In other words, the contention was that it was the lode, which was the principal thing patented, and that the surface ground was a mere incident for the convenient working of the lode. The contention was presented and denied by the instructions which were given and refused by the lower court. That court instructed the jury that if they found Tarbet "was in possession of the claim, describing it, holding the same in accordance with the mining laws and the customs of the miners of the mining district, and that the apex and course of the vein in dispute is within such surface, then, as against the appellant, the latter is not entitled to be possessed of the land within his boundaries to any depth, and also of the vein in the surface to any depth on its dip, though the vein in its dip downward passes the side line of the surface boundary and extends beneath other and adjoining lands, and a trespass upon such part of the vein on its dip, though beyond the side surface line, is unlawful to the same extent as a trespass on the vein inside of that line, and that the boundary between the two is the surface line, on its dip, is limited in two ways—by the length of the course of the vein within the surface, and by an extension of the end lines of the surface claim vertically, and in their own direction, so as to intersect the vein on its dip; and the right of a possessor to recover for trespass on the vein is subject only to these restrictions."

Again: "The defendant (plaintiff in error) has not shown any title or color of title to any part of the vein except so much of its length on the course as lies within the Flagstaff surface, and the dip of the vein for that length; and it has shown no title or color of title to any of the surface of the South Star and Titus mining claim, except so much of No. 3 as lies within the patented surface of the Flagstaff mining claim."

And the following instructions propounded by the owner of the Flagstaff:

"By the Act of Congress of July 26, 1866, under which all these locations are claimed and have been made, it was the duty of the miner that was located and claimed; the lode was the principal thing, and the surface area was a mere incident for the convenient working of the lode; the patent granted the lode, as such, irrespective of the surface area, which an applicant was not bound to claim; it was his convenience for working the lode that controlled his location of his surface area; and the patentee under that Act takes a fee simple title to the lode, to the full extent located and claimed under said Act."

Commenting on the instructions, Mr. Justice Bradley, speaking for the court, said:

"These instructions and refusals to instruct indicate the general position taken by the court below, namely, that a mining claim secures only so much of a lode or vein as it covers along the course of the apex of the vein on or near the surface, no matter how far the location may extend in another direction."

And after stating that the Act of 1872 was more explicit than that of 1866, but the intent of both undoubtedly the same, as it respects lines and sides, and the right to follow the dip outside of the latter, he proceeded as follows:

"We think that the intent of both statutes is that mining locations on lodes or veins shall be made thereon lengthwise, in the general direction of such veins or lodes on the surface of the earth where they are discoverable; and that the end lines are to cross the lode and extend perpendicularly downwards; and to be continued in their own direction either way horizontally; and that the right to follow the dip outside of the said lines is based on the hypothesis that the direction of these lines corresponds substantially with the course of the lode or vein at its apex on or near the surface. It was not the intent of the law to allow a person to make his location crosswise of a vein so that the side lines shall cross it, and thereby give him the right to follow the strike of the vein outside of his said lines. That would subvert the whole system sought to be established by the law. If he does locate his claim in that way, his rights must be subordinated to the rights of those who have properly located their claim, and their right to follow the dip outside of their said lines cannot be interfered with by him. His right to the lode only extends to so much of the lode as his claim covers. If he has located crosswise of the lode, and his claim is only one hundred feet wide, that one hundred feet is all he has a right to. This we consider to be the law as to locations on lodes or veins."

The location of the plaintiff in error is thus laid across the Titus lode, and the direction of these lines corresponds substantially with the surface, and the side lines of the location are really the end lines of the claim, considering the direction or course of the lode at the surface.

"As the law stands, we think the right to follow the dip of the vein is bounded by the end lines of the claim, properly so called; which lines are those which are crosswise of the general course of the vein on the surface. The Spanish law mining law confined the owner of a mine to perpendicular lines on every side, but gave him greater or less width according to the dip of the vein. See Rockwell, pp. 56-58 and pp. 274-275. But our laws have attempted to establish a rule by which each claim shall be so many feet of the vein, lengthwise of its course, to any depth below the surface, although laterally its inclination shall carry it ever so far from a perpendicular. This rule the court below strove to carry out, and all its rulings seem to have been in accordance with it."

This law was followed and applied in *Argentine Mining Company v. Terrible Mining Company* (122 U. S. 478), and in *Iron Silver Mining Company v. Elgin* (118 U. S. 196); *King v. Amy & Silvermith Mining Company* (132 U. S. 223). The locations passed upon in these cases were made under the Act of 1872, but we have seen that the intent

of that Act and the Act of 1866, "as it respects end lines and side lines," was the same.

But appellant urges that "those cases are not in point here." We think that they are. The patent in the Flagstaff case appears to have been the same as here, and besides whatever the patent here it must be confined to the rights given by the statute which authorized it.

In the Flagstaff case the lode was claimed, and hence the right to follow it beyond the surface boundaries of the location was claimed. Here the lode is claimed and the right to follow it outside of the surface boundaries, that is, beyond the line *f-g* to the point *x*. In that case the right contended for was denied on the principle applicable to end and side lines. In this case the right contended for must be denied by the application of the same principle.

But, appellant asks, admitting for the argument sake that it (the line *g-h*) does constitute an end line of the location within the meaning of the law of May 10, 1872, does it constitute the end line of the Contact vein? And in answering the question he says: "The end line of a lode is the boundary line which crosses it regardless of whether it was originally intended as an end line or side line." Four times has this principle been sustained by this court. He then cites the cases we have cited, and claims that they "are, of course, conclusive of this controversy if they are in point."

Under the law of 1866 a patent could be issued for only one vein. (14 Stat. at Large, 351.) The Act of 1872 gave to all locations therefrom made, as well as to those thereafter made, all veins, lodes and ledges the top or apex of which lies inside of the surface lines. Section 3 of the Act, which is also section 2322 of the Revised Statutes, is as follows:

"The locators of all mining locations heretofore made, or which shall hereafter be made, on any mineral vein, lode or ledge, situ-

by the locator, were the true end lines, but those which are "cross-wise of the general course of the vein on the surface."

The court in *Iron Mountain Mining Co. v. East Chance Mining Co.*, decided at the present term (ante, p. 1), reviewed the cases we have cited, and, speaking for the court, Mr. Justice Brewer said:

"Our conclusion may be summed up in these propositions: First, the location as made on the surface by the locator determines the extent of rights below the surface; second, the end lines, as he marks them on the surface, with the single exception hereinafter noticed, place the limits beyond which he may not go in the appropriation of any vein or veins along their course or strike; third, every vein, the top or apex of which lies inside of such surface lines extended downward vertically, becomes his by virtue of his location, and he may pursue it to any depth beyond his vertical side lines, although in so doing he enters beneath the surface of some other proprietor; fourth, the only exception to the rule that the end lines of the location as the locator places them establish the limits beyond which he may not go in the appropriation of a vein on its course or strike is where it is developed, that, in fact, the location has been placed not along, but across the course of the vein. In such case, the law declares that those which the locator called his side lines are his end lines and those which he called end lines are in fact side lines, and this, upon the proposition that it was the intent of Congress to give the locator only so many feet of the length of the vein, that length to be founded by the lines which the locator has established of his location. Our laws have attempted to establish a rule by which each claim shall be so many feet of the vein, lengthwise of its course, to any depth below the surface, although laterally its inclination shall carry it ever so far from a perpendicular." (*Mining Company v. Turbell*, 98 U. S. 463-469.)

These propositions we affirm, with the addition that the end lines

hereby relocate, is described as follows: Commencing at a point on the northerly bank of Deer Creek, which point is 80 feet S., 11 deg. 45 minutes east of the northeast corner of the New Years tunnel and running thence along the line of the lode towards the N. E. corner of the Providence Mill, about S. 36 deg. 15 minutes east, 200 feet more or less, to a point and stake on the northerly line of the Providence mine, patented, designated as Mineral Lot No. 40 for the south end of said lode line. And that the contact vein crosses in its onward course the southerly end line of said New Years extension claim and enters the lands and premises of plaintiff described in said bill of complaint."

It is hence contended that if the line *f-g* is the southerly end line of the New Years extension it must necessarily be the northern end line of the Providence mine. This does not follow, nor is there any concession of it. Coincidence of lines between claims does not make them side lines or end lines. Whether they shall be so regarded depends upon the legal considerations which we have already sufficiently entered into and need not repeat. We do not say that there may not be an agreement settling end lines. One example of such an agreement was exhibited in *Richmond Mining Co. v. Eureka Mining Co.* (103 U. S. 839).

(b.) The testimony relied on was admitted against the objection of defendants (appellees). It was as follows:

"Q. Then you may go on Mr. Vincent, and state how you started that work, and how you planned it, and what communications you had, if any, with the board of directors of the Champion Mining Company."

"A. Well, I was sent up by the board of directors to do whatever work I thought was the best for the company. I started that shaft down and had it down about 10 feet, and I reported to the board of directors in session about what work I had done and they calculated to go to work and put up hoisting works and run that shaft down further."

"Q. What, if any, communication did you make, or was there any communication from the board to you concerning the direction of the shaft, and why any given direction was adopted for the shaft?"

"A. There was none, but then I reported to the board that such was the case, that the shaft was laid out so it would never interfere with this line."

The witness further testified that he sank the shaft 540 feet and was discharged on the 1st of August, 1889, and he was further questioned as follows:

"Q. State whether at the time you were sinking that shaft you were called upon by Mr. Walrath, the complainant in this action, or his brother, Mr. Richard Walrath, to make any inquiry of you concerning the construction of that shaft and what the intention was, whether to cross the Providence line or not, as marked on the map?"

"A. Well, Mr. Walrath he happened to come along, and he made a remark to me that he wished for us, of course, to keep his line and not to cross it, as he didn't want any more trouble as he did have with some other mining properties adjoining; that he didn't want any more holes in his ground; and so I answered him that I would respect his line as long as I am here."

"The Court—That you would respect his line as long as you were there?"

"A. As long as I was superintendent of the mine."

"Q. Where did this conversation take place?"

"A. Right on the premises."

"Q. You were then acting as superintendent, were you?"

"A. Yes, sir."

"Q. What line was referred to at that time as the Providence line; can you point it out on the map?"

"A. Yes, sir; it is the line marked 'A B' on the map, Exhibit 4."

This testimony does not establish an equitable estoppel, nor is the corporation bound by the declarations of the superintendent. They were without the scope of his agency or authority.

(2.) The right to that portion of the Contact ledge within the boundaries of the parallelogram *h-i-k-h* presents an interesting question. It does not appear to have been submitted to either of the lower courts, but the right by the decree of the Circuit Court is given to appellee by adjudging to it that portion of the vein on its course which lies northeasterly of the line *g-h* and its continuation.

The question is a new one in this court, but we think it is determined by the principles hereinbefore laid down. It may be true that under the Act of 1866 the patenting of the Providence mine in its irregular shape was in all respects legal and proper, and that the Act did not require the location to be made in the form of a parallelogram or in any particular form, and that there was no requirement that the end lines should be parallel. It is also true that under that Act only one vein could be included in a location, no matter how much surface ground was included in the patent, but that under the Act of 1872 possession and enjoyment of all the surface included within the lines of their location and all veins, lodes and ledges throughout the entire depth, the top or apex of which lies inside of such surface lines extended downward vertically, were given.

But rights on the strike and on the dip of the original vein and rights on the strike and on the dip of the other veins, we have decided, are determined by the end lines of the location. In other words, it is the end lines alone, not they and some other lines, which define the extralateral right, and they must be straight lines, not broken or curved ones. The appellant, under his contention, would get the right such lines would give him and something more besides outside of them. To specialize, he would get all within a plane drawn through the line *g-h*, and all within the planes drawn through the sides of the parallelogram *h-i-k-h* (Fig. 1).

It may be that the end lines need not be parallel under the Act of 1866; may converge or diverge, and may even do so as to new veins, of which, however, we express no opinion, but they must be straight—no other define planes which can be continuous in their own direction within the meaning of the statute. It may be that there was liberty of surface form under the Act of 1872, but the law strictly controls the right on the vein below the surface. There is liberty of surface form under the Act of 1872. It was exercised in *Iron Silver Mining Co. v. Elgin Mining Co.* (*supra*), in the form of a horseshoe; in *Montana Co. Limited v. Clark* (42 Fed. Rep. 629), in the form of an isosceles triangle. The decree is affirmed.

International Mining Congress.

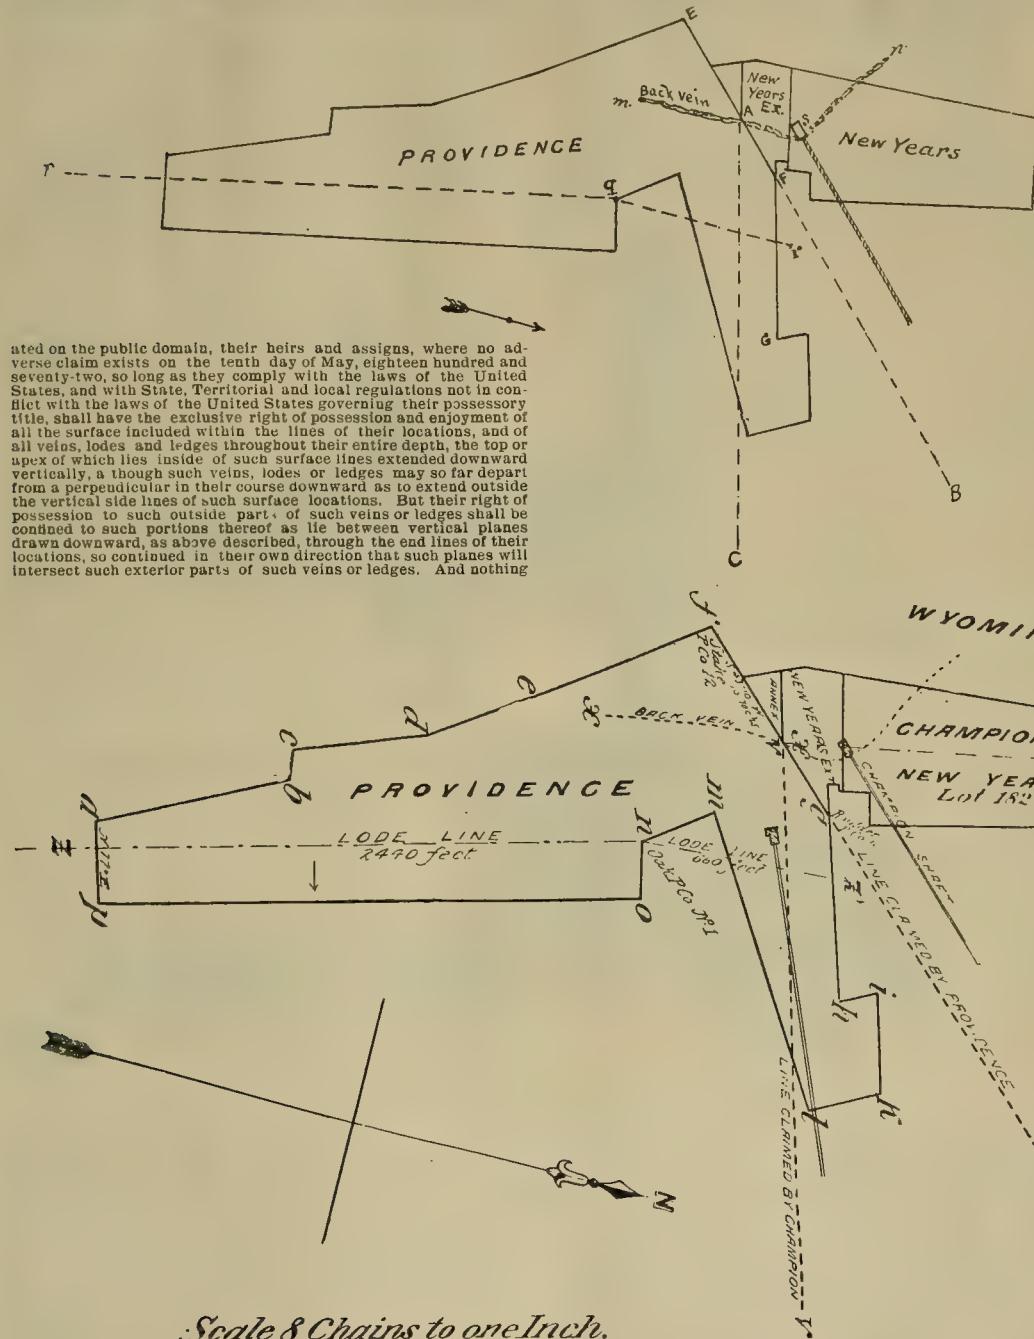

The second annual session of the International Mining Congress, which first met in Denver, Colo., one year ago, convened last Wednesday in Salt Lake City, Utah. There were present about 1500 delegates, representing all parts of the American continent. The organization resulted in the selection of B. F. Montgomery of Colo. president, W. D. Johnson of Utah secretary, J. H. Hawley of Idaho first vice-pres't, Chas. D. Lane of Cal. second vice-pres't, E. Elgura of Peru third vice-pres't.

There were presented two reports from the committee on proposed revision of the Federal mining laws. C. J. Moore of Colo., chairman of the committee, presented the majority report; W. P. Heyburn of Idaho made a minority report in opposition to revision.

The majority report recommends that the law of apex be abolished, with its corollary propositions, extralateral rights and questions of intersecting veins. The report recommends in its place legislation to establish enlarged locations, the location to be defined by straight boundary lines, but not necessarily parallel lines, no rights to extend beyond a vertical projection of the boundaries, and the location to include everything within the vertical projection, the enlargement of claims being intended as compensation for the abolition of extralateral rights. The majority report also recommends a new law governing the method of making locations, to make an official record of a claim necessary before any transfer of a claim can be valid, the location to be staked out as now, but requiring a survey by a Federal deputy mineral surveyor and a record made of this survey in the County Recorder's office as well as in the Surveyor-General's office.

The minority report recommends the retention of the present mining laws and the abolition of local rules and laws.

The two reports were the subject of considerable animated discussion all day Thursday. A motion to postpone final consideration of the revision question for one year was voted down, and yesterday morning the debate was renewed.

Scale 8 Chains to one Inch.

in this section shall authorize the locator or possessor of a vein or lode which extends in its downward course beyond the vertical lines of his claim to enter upon the surface of a claim owned or possessed by another." (Act of May 10, 1872, Sec. 3; Sec. 2322 U. S. Rev. Stat.)

Appellant's right upon the Contact vein is given by this statute. What limits this right extralaterally? The statute says vertical planes drawn downward through the end lines of the location. What end lines? Those of and as determined by the original location and lode, the Circuit Court of Appeals decided. Those determined by the direction of the newly discovered lodes, regardless whether they were originally intended as end lines or side lines, the appellant, as we have seen, contends. The Court of Appeals was right. Against the contention of appellant the letter and spirit of the statute oppose, and against it the decisions of this court also oppose.

The language of the statute is that the "outside parts" of the veins or ledges "shall be confined to such portions thereof as lie between vertical planes drawn downwards" * * * through the end lines of their locations * * *. And Mr. Justice Field, speaking for the court, said, in *Iron S. M. Co. v. Elgin Mining Co.* (118 U. S. 198-8):

"The provision of the statute, that the locator is entitled throughout their entire depth to all the veins, lodes or ledges, the top or apex of which lies inside of the surface lines of his location, tends strongly to show that the end lines marked on the ground must control. It often happens that the top or apex of more than one vein lies within such surface lines, and the veins may have different courses and dips, yet his right to follow them outside of the side lines of the location must be bounded by planes drawn vertically through the same end lines. The planes of the end lines cannot be drawn at a right angle to the courses of all the veins if they are not identical.

The court, however, did not mean that the end lines, called such

of the original veins shall be the end lines of all the veins found within the surface boundaries.

The appellant contends that, by agreement, by acquiescence and by estoppel the line *f-g* has become the end line between the two claims.

This contention is attempted to be supported by (a) A relocation of the New Years extension claim, by which it is asserted it recognized and designated the line *f-g* as the northerly end line of the Providence claim. (b) The testimony of the superintendent as to what took place between him and the directors before sinking the Champion shaft, and afterwards between him and a co-tenant of complainant (appellant).

(a.) The relocation does not in terms recognize the line *f-g* as the northern end line of the Providence. Its relocations are:

"And whereas, part of this claim as originally described and as hereby relocated, conflicts with the rights granted by the letters patent of said Providence mine, said Lot No. 40, now, therefore, so patent of said Providence mine, which runs 43 degrees 10 minutes east, designated, conflicting, or now conflicts, with any portion of the surface or lode, claims or rights granted by said patent, is and are hereby abandoned."

"Which portion of this claim so abandoned is described as follows: All that portion of the above-described New Years extension claim for surface and lode which lies south of the northern boundary line of said Providence mine, which runs 43 degrees 10 minutes east, across the southeastern portion of this claim."

It will be observed by reference to Fig. 1 that the northern boundary of the Providence is not one line, but two lines, and it is the one which runs north 43 degrees 10 minutes east across the southern corner, which is designated in the relocation of the New Years claim. In the notice of relocation, however, the northerly line of the Providence is called the south end line of the relocated ground. The description is as follows:

"The lode line of this claim as originally located, and which I

Orthoclase as a Gangue Mineral in a Fissure Vein.

By WALDEMAR LINDGREN.

The occurrence of feldspars as gangue minerals in fissure veins is not common. But, on the other hand, many well authenticated instances make it certain that they may be formed during the conditions attendant upon the deposition of ordinary fissure veins, i. e., by aqueous deposition. Lime feldspars or soda lime feldspars appear to occur very rarely, the only known instance being that described by the author from Grass Valley, Cal.* Even this case could not be as completely demonstrated as would have been desirable. Albite is more common. While it is only rarely mentioned from European mineral deposits, it has been described as occurring in places very abundantly in Australian gold quartz mines as well as in similar veins in the province of Minas Geraes, Brazil. In the United States, albite has been noted from several places. Genth describes it from the Steele mine, North Carolina, in the Appalachian gold belt. In California it was first noted by Genth in 1859 from Winters gold vein, Calaveras county.

Albite was also described by Wendell Jackson from Stanislaus mine, Calaveras county, and lately again by H. W. Turner from the Shaw mine, El Dorado county. The mineral will probably be found in many other places in the vicinity of the mother lode. It was recently noted by the author in specimens from the Gentle Annie mine, near Placerville. In spite of very careful search, no albite has yet been recognized from Nevada City or Grass Valley.

Orthoclase has been described from several European ore deposits, generally having the crystallographic forms and characteristics of adularia. Thus we find it recorded from Schmiedeberg and Kupferberg in Silesia, Himmelfahrt mine near Freiberg in Saxony, Schlaggenwald in Bohemia, Felsobanya and Schemnitz in Hungary; also from Transylvania at Botesbanya, Cseb and Verospatak. Most of the occurrences in the latter two countries are from gold quartz veins. Everywhere, however, the orthoclase is more of a mineralogical rarity than an abundant gangue mineral.

Breithaupt described, without detailed notes as to its occurrence, an orthoclase of adularia habit from the Valenciana silver mine, Mexico, and gave it on account of supposed abnormal angles the name of "valencianite." This valencianite probably occurred as gangue mineral in a vein.

From the United States orthoclase has been noted by Genth as occurring in minute crystals at the Silver Hill and Steele mines, North Carolina. G. F. Becker has recently recognized the presence of small grains of orthoclase in a vein quartz from Alaska. It may be added that during the examination of certain auriferous veins at Silver Crown, Wyoming, by the author, grains of microcline were sometimes found in thin sections of vein quartz.

Orthoclase is frequently mentioned from tin veins, in Saxony, Bohemia and Cornwall; and while many of these occurrences are beyond doubt, yet it may be pointed out that, owing to the peculiar structure of these veins, some feldspar from the surrounding granite might in the older reports have been mistaken for true gangue mineral. While orthoclase, of course, is common on pegmatite veins, it has not as yet been proved that these ever are auriferous.

During the examination of Silver City mining district, in southern Idaho, undertaken last summer for the U. S. Geological Survey, a vein was encountered which from various standpoints proved to be most interesting.

The Black Jack-Trade Dollar vein outcrops on Florida mountain, near Silver City, and can be traced for about one mile. The strike of the vein is easterly and westerly; its dip is nearly vertical. It cuts three formations—a normal muscovite-granite forming the fundamental rock, a basalt resting on this granite and a rhyolite capping both. As the latter two rocks are of Tertiary (Miocene) age, the deposit is clearly of comparatively recent origin.

The ore minerals are pyrite, chalcopyrite and argentite; the value is chiefly in silver with a smaller amount of gold. The vein is a characteristic fissure vein, well defined, and having a thickness of from a few inches to 2 or 3 feet. In the granite it is closely followed by a basaltic dike. The ordinary ore consists of typical vein filling, though low grade ores consisting of altered rhyolite appear along certain parts of the vein. The gangue is of an interesting and unusual character, consisting of quartz and orthoclase, in varying proportions. In general, quartz predominates, but at many places the two minerals occur in equal proportions or even with prevailing orthoclase.

The first and most common occurrence of the orthoclase is as large, irregular milk-white grains, intergrown with vein quartz; it contains inclusions of pyrite and argentite and sometimes thin lamellæ of pyrite deposited parallel to the best cleavage plane. The grains appear under the microscope as simple crystals. Crusts with projecting crystals of clear quartz and whitish feldspars with broken or curved faces often occur.

The second mode of occurrence is as small, more or

*17th Ann. Rept., U. S. G. S., p. 87. This feldspar occurs on small stringers differing in character from the typical gold quartz veins from that locality.

less perfect, almost transparent crystals 1-3 mm. in diameter, coating cracks and crevices in the altered granite adjoining the vein.

The third occurrence is as abundant, small and perfect crystals coating a lamellar quartz, itself a pseudomorph after some other mineral, probably calcite.

The vein is apparently richest in orthoclase where traversing the granite. Much of it was also found where it cuts the rhyolite, but none was observed in the basalt. The vein where entering the basalt contracts and becomes very narrow.

All these occurrences demonstrate beyond doubt the aqueous origin of the mineral. The crystals have the habit of adularia, though the only strongly developed faces are 110 and 101 (m and x, Dana), producing a distinctly wedge-shaped appearance. One of the larger crystals from the first described occurrence on the main vein was analyzed by Dr. W. F. Hillebrand with the following result:

| | |
|--------------------------------------|-------|
| SiO ₂ | 66.28 |
| Al ₂ O ₃ | 17.93 |
| K ₂ O..... | 15.12 |
| Na ₂ O..... | .25 |
| Undetermined..... | .42 |

Total.....100.00

Specific gravity.....2.54

The analysis indicates typical adularia. No ortho-

that there would be a strong demand for years for competent men, and added that England kept the United States drained of its best mining talent. They are wanted in South Africa, in Australia, New Zealand; in fact, all over the world, and they can get higher pay than doctors, lawyers or any other class of professional men. Any young man who is ambitious for a career that will lead to fortune, if not to fame, and perhaps to both, if he be industrious and steady, will make no mistake by qualifying himself in the direction of mineralogy."—Denver Daily Mining Record.

Half Universal Radial Drill.

Herewith is illustrated the Half Universal Radial drill, manufactured by the Bickford Drill and Tool Co., Cincinnati, Ohio. This machine is made in two sizes, called styles "A" and "D." In both the base plate is heavy and deep, ribbed and braced on the under side so as to avoid all spring. The column, with large, round base, is bolted to the bottom plate, and over this column, with long bearing on top and bottom, is fitted the outside sleeve which carries the arm. The sleeve rests on the bottom, on a large flange, and is fitted with three clamping bolts. The rotating arm fitted over the sleeve is of box form, strongly braced, and raises and lowers by power. The flange of the sleeve is provided with roller bear-

HALF UNIVERSAL RADIAL DRILL.

class has thus far been found in the other veins near Silver City; many of them, though, possesses interesting structural and mineralogical characteristics which will be described in the full report of the district.

Orthoclase has been artificially produced by the wet way by Friedel and Sarasin in 1881. In 1890, Ch. and G. Friedel obtained orthoclase in small crystals by heating pulverized muscovite with a solution of potassic silicate. It is easily seen that the interesting experiment has a direct bearing on this occurrence.

The reason why orthoclase is not more frequently found on mineral veins may possibly be found in the abundant and usual presence of carbon dioxide in thermal waters. Under such conditions the more stable compound—muscovite or sericite—would be formed, orthoclase being rapidly attacked by waters under pressure containing CO₂. Orthoclase could then only result if CO₂ were absent or present in only small quantities.

A Paying Profession.

"There is no profession that holds out such tempting allurements to the youth of to-day as that of the metallurgist and mining expert," said Mr. D. G. Downs of San Francisco. "Last year, of the class of about a dozen who were graduated at the school of mines in the University of California, at least ten have found excellent situations, with big salaries. Our universities cannot turn out expert mining engineers fast enough for the demand. When I was in London last summer an English scientist told me

ings, which allow the arm to swing with perfect freedom. The machine is driven by a cone pulley, shown on the back of the drill, and by miter gears through the inside of the column to the top. All sizes are fitted with back gearing. The spindles have automatic feed and are fitted with the Bickford patent quick return motion. The box table and the countershaft complete are furnished with each machine. The shafts, spindles, worm, worm rings and the main gearing are made of steel. All gearing is cut from the solid. The head of these machines may be swiveled at any angle upon the arm. The makers also manufacture full universal radial drills, in which the head rotates and the arm revolves around its own axis, thereby making it possible to drill at any angle and in any direction within the range of the arm. The style "A" machine will drill to the center of a 10-foot circle and will receive 4 feet 10 inches over base. It weighs 6500 pounds. The style "D" machine will drill to the center of a 11-foot circle and will receive 6 feet 8 inches over base. It weighs 12,000 pounds. Full details in regard to these tools can be had from the Bickford local representatives—Messrs. Henshaw, Bulkley & Co., San Francisco.

Meant to be Humorous.

TO THE EDITOR:—In a recent issue of your valuable paper there appeared an article, or, rather a letter, on mine promotion, in which the writer deeply deplores the variation between the owner's statement of the value of his mine and the actual assays. All of us who have engaged in the examination of mines

and prospects have encountered this evil and felt the need of some method of overcoming the difficulty without the task of sampling and assaying, which frequently means a laborious and expensive trip. This the writer believes he has done, and ventures to offer his solution of the problem to the readers of the MINING AND SCIENTIFIC PRESS, in the hope that they will derive as much benefit from it as he has done.

All have, of course, noticed that the prospector's statement is invariably a multiple of the true assay, and so the writer's first attempt was to find the coefficient of expansion. This he soon saw to be so modified that a formula was necessary for its complete expression, and the formula could not be obtained from theoretical considerations, but had to be deduced from a rigid and painstaking comparison of numberless assays. By this method he found the influence of time, distance and the prospector's experience, and its expression, in the following formula:

Let A = true assay; S = owner's statement; y = number of years owner has prospected; t = time in weeks elapsed since last assay; d = distance in miles to prospect.

$$\begin{aligned} \text{Then } S &= A t \frac{1}{y} \frac{1}{d} \\ \therefore A &= \frac{S}{t \frac{1}{y} \frac{1}{d}} \end{aligned}$$

By finding d and y in terms of the other members of the equation, formulae may be obtained for determining the experience of a prospector or the location of a prospect, which will be very convenient for those who contemplate grubstaking a man in the Klondike.

The writer is at present engaged in a research developing the relation between a prospect vein, according to the owner's statement, and the angle formed by the vein, the owner's eyes and the nearest valuable mine.

Berkeley, Cal., July 1st, '98.

The Calumet and Hecla, Michigan.

The Calumet and Hecla Copper Mining Company employs 5000 men. The monthly pay roll is \$400,000. Its annual receipts average \$14,000,000, from which dividends at the rate of \$40 per share are annually declared. The total dividends paid by the company since its reorganization in 1867 amount to over \$52,000,000. The total receipts of the company to date amount to more than \$385,000,000.

Overlying the vein is a cupriferous amygdaloid rock; its floor or footwall is composed of trap rock. The first active mining by the present company was begun in 1867, in which year the initial shipment of 768 tons of copper was made. From that year the product kept increasing, till now the annual shipment has reached 96,000,000 pounds of copper.

The formation in northern Michigan, extending from Portage lake northwesterly to Keweenaw point, and thence across Lake Superior to Ontonagon, is a conglomeration of pebbles in solid form with an intermixture of pure native copper.

The method employed in mining this vein is as follows: The shafts proper which reach to the bottom of the mine are timbered from bottom to collar, pine timber being used clear through. Levels are uniformly 90 feet apart, which affords access to the different parts of the mine. Through these levels the copper rock is brought to the main shaft by tram cars that switch to and fro from the different openings. At the intersection of each level the ore is dumped into the skip which runs up and down the main shaft at a speed of 600 feet per minute. At the summit the skip rises to the top of the rock house, where the ore is automatically dumped into the ore crushers, thence into the ore cars, whence it is carried to the mills for treatment. The vein is punctured by diamond drills, the average depth of each hole being 5 feet.

In the Calumet and Hecla mine seventy-five drills are operating and they blast twice a day. During the forty years of mining on the conglomerate the bed, which averages 12 feet, has never lost its width, while the thickness ranges from 15 to 25 feet. The width and thickness of the amygdaloid vein are uncertain. Sometimes they are found to measure 25 feet across, while at other times but a few inches. The conglomerate is a dull red in color; the amygdaloid is a dirty gray.

The character of both lodes is such that the most economical way to mine them is by stopes, inclining toward the vein and under it near the footwall, and working obliquely around it.

The Calumet and Hecla stamp mill is situated at Lake Linden. There are practically two mills in one, of eleven ball heads each, and having a capacity of 6000 tons conglomerate per day. The metal is found deposited in the rock in all possible forms. The separation of the copper from the rock is effected by passing the stamped rock over a system of jigs, whereby the sand, by its less specific gravity, is floated off into a steady current of water, and the copper, being the heavier, settles and falls through the sieves. One line of jigs succeeds another, over which in succession the copper which has just passed through a previous set of sieves is made to pass, and the sand which is contained in the water is carried away by the current of water to the lake by a sys-

tem of sand wheels and launders. The number of jigs and the velocity of the current are so regulated as to secure the desired separation, with very little loss of copper.

The head current of water coming from the stamp heads, in which float the light material and fine dirt, is turned from the main launder into lateral ducts, which convey it to the large slime tables over whose conical-shaped, slow-moving surface it is made to pass.

The stamp mills and crushing machinery have been so perfected that 33 cents would cover the entire cost of treating a ton of rock in the stamp mill.

Some New Patents.

FIG. 1.

CABLEWAY SYSTEM AND APPARATUS FOR EXCAVATING AND CONVEYING.—Patent No. 605,488, dated June 14, 1898: J. H. Lancaster, New York. Fig. 1 is a side view showing one form of improved railway system for operating a series of grapples, dredgers, and diggers.

FIG. 1.

GRAPPLE, BUCKET, ETC.—Patent No. 605,489, dated June 14, 1898: J. H. Lancaster, New York. Fig. 1 is a side view of a clam-shell bucket.

FURNACE FOR WORKING ZINC AND LEAD.—Patent No. 605,802, dated June 14, 1898: R. Schneider, Dresden, Saxony. The drawing represents a vertical section of the entire furnace.

Fig 1

Fig 2

PORTABLE ASSAY FURNACE.—Patent No. 606,149, dated June 21, 1898: J. G. Iis, San Francisco, Cal. This invention has for its object a portable assay furnace that can be taken apart and readily

set up for use and one that combines in its construction the relatively large capacity of the square furnace and the quality or property possessed by the cylindrical furnace of withstanding high temperatures without warping or being twisted out of shape. Fig. 1 represents, in front elevation, a portable furnace for assayers' use constructed in accordance with the invention. Fig. 2 is a longitudinal section.

FIG. 1.

SLAG TRUCK.—Patent No. 605,566, dated June 14, 1898: John H. Morcom, Denver, Colo.: Improvement in slag trucks. Fig. 1 represents a longitudinal elevation, partly in section.

ROLLING MILL.—Patent No. 605,669, dated June 14, 1898: S. V. Huber, Youngstown, Ohio: Improvements in construction and operation of feed tables for a train of two or more three-high mills arranged in a common line of feed. Fig. 1 is a view in elevation of two stands of rolls arranged in a common line of feed and having the improved feed mechanism arranged between them. Fig. 2 is a view in elevation, on an enlarged scale, of a portion of the mill shown in Fig. 1 and also of the front of one of the end feed tables. Fig. 2 is a similar view, being a continuation of Fig. 2 and showing the remaining portion of the intermediate feed table and also the end feed table.

COMBINED ORE CONCENTRATOR AND SLIMER.—Patent No. 606,138, dated June 21, 1898: F. W. Harlow, Eureka, Colo. The object of the invention is to provide a new and improved combined ore concentrator and slimer arranged to readily separate the tailings from the ore in a simple manner without causing a heavy running expense. Fig. 1 is a side elevation of the improvement. Fig. 2 is a plan view of the same.

War Tax Stamps on Stock Issues.

On the question of the construction of that part of schedule A of the Act of June 13, 1898, imposing a tax "on each original issue, whether on organization or reorganization, of certificates of stock," it is held by the Commissioner of Internal Revenue that the meaning of the words "original issue," as therein used, is limited and controlled by the words, "whether on organization or reorganization," and that therefore the only certificates of stock on which the tax of 5 cents on each \$100 of face value or fraction thereof as imposed by this Act are those issued on or after July 1, 1898, on the organization or reorganization of a company. It is held, further, that in the case of a corporation having, for instance, an authorized capital of \$1,000,000, of which it has issued only \$500,000 prior to July 1, 1898, and which

on or after that date finds it necessary to make one or more additional issues under the authority possessed by it, each additional issue thus made is an "original issue" within the terms and meaning of the statute under construction, and the certificates of such issue are subject to the stamp tax.

Where any original certificate issued is presented by the holder to the company or corporation for the issuance of another certificate or certificates in lieu thereof, the certificate or certificates thereupon issued to take the place of the original certificate could not, under the language and limitation of the statute above recited, require any stamp as long as there is no sale or agreement to sell or memorandum of sale or transfer of any of those certificates issued in lieu of the original.

In case of sale, where the evidence of transfer is shown only by the books of the company, a tax of 2 cents is required to be paid on each \$100 of face value or fraction thereof, and the stamp representing this is required to be placed upon such books.

Where the change of ownership is by transfer certificate—that is to say, the executed authority to transfer is contained on the back of the stock certificate which is to be transferred—the stamp must be placed on the transfer certificate; that is to say, upon the surrendered certificate containing the transfer.

In cases of agreements to sell, or where the transfer is by delivery of the certificate as signed in blank, there must be executed a memorandum thereof, to which the stamp is required to be affixed.

Under the ruling herein stated, in a case, that may be supposed, of a man who is the owner of a certificate for 100 shares of stock and wishes to sell ten of them to another person, the result being that one certificate would be issued for the ten shares sold, and also an additional certificate for the ninety shares still remaining with him, the certificate for ninety shares issued, with the certificate for ten shares sold, in lieu thereof, does not require any stamp, and the certificate for the ten shares does not require a stamp representing the tax of 5 cents on each \$100 or face value or fraction thereof, as it is not an original issue thereof. The only stamp required with reference to these certificates is a stamp on the transfer of the shares sold, representing the payment of the tax of 2 cents on each \$200 of face value or fraction thereof.

In another case, stated for illustration, where a man holds several certificates for shares of stock aggregating 100 shares, and for his convenience calls upon the company to issue to him, in lieu thereof, one certificate for 100 shares, there being no sale or agreement to sell, or memorandum of sale or delivery or transfer of this new certificate, the statute does not require the affixing of any stamp thereto.

Another "Recorder" Decision.

At San Bernardino, Cal., in the case of J. W. F. Diss, County Recorder, against F. G. Killiam, district recorder of the Virginia Dale mining district, Judge Campbell holds that the Act of March 27, 1897, entitled, "An Act prescribing the manner of locating mining claims upon the public domain of the United States, recording notices of locations, and providing for the deposit of district records with county recorders and prescribing the effect to be given to recordation of notices and location and affidavits," constitutional, and decides in favor of the plaintiff. A local report of the decision says: "While the plaintiff Diss gets judgment, he is in reality loser, for the reason that the action was brought to determine whether the county recorder was personally entitled to the fees for recording notices of mining claims. If the Act had been declared unconstitutional then the recorder would be entitled to the fees, but under the decision of Judge Campbell the notices must all be recorded in the recorder's office, and the county will be entitled to the fees. Under the County Government Act, which goes into effect January 1, the recorder will receive \$1500 per annum and 6 cents per folio for recording. But the presumption all along has been that the recorder would get the fees for recording mining claims the same as at present. This was evidently the intention of the persons who fixed the salary. The Court had at that time decided under an old Act that the fees for recording mining claims was a perquisite of the recorder. The fees for recording mining claims have averaged \$600 per year, and this, with the \$1500 per year, would have made it possible to run the office on the salary prescribed by law. How the next recorder will be able to run the office and hire a deputy on \$1500 per year is a problem which he will have to solve."

SOME TIME AGO an Arizona subscriber wanted a copy of this paper published in 1864. There are frequent requests for copies published in the 70's and 80's and orders for issues in the 90's are of daily occurrence. Chicago and New York papers have agreed upon a scale of prices for back numbers: For papers one month old, 10 cents; three months old, 25 cents; six months old, 50 cents; one year old, \$1; and \$1 is added for each additional year. Thus a copy for any day in April, 1890, would cost the purchaser \$7, and in certain events it would be cheap at that price.

Scorification and Cupellation Without Muffle

---A New Furnace and Method for Gold and Silver Assays.*

By GEORGE A. KOENIG, PH. D.

This new departure in assaying is the outcome of a long-felt desire to shorten the time required in muffle-assaying, as well as to do both crucible and scorification work in one furnace. The first object in view was the gold assay, which must always be a combination of the crucible and muffle-work. The large lead buttons consume much time in their reduction by scorifying and cupelling. The Hoskins gasoline furnaces have been a great convenience, for years past, in that class of practice, where only one assay was required at a time. But even with them I found myself hampered, since the crucible-furnace takes only one crucible at a time, and my practice implies always duplicate assays. Another difficulty was to get the muffle up to the necessary heat and to maintain it at that heat. Whenever I had pumped myself into perspiration and out of breath, the question presented itself, "Is the muffle necessary to do this work properly?" Hartmann and Plattner and all their blow-piping disciples have shown that very good results are obtainable by playing a direct flame upon the work-lead. Could this be done on the regular muffle-assay scale? I placed a cupel upon a fire-brick, surrounded it with charcoal, and then played upon it with a Bunsen gas blow-pipe. The result was encouraging. With some care a 2.75-inch scorifier charged with 0.1 A. T. of a 100-ounce ore could be melted down and scorified without any apparent loss. I thought then of constructing a furnace with four blow-pipes in a row; but the combination of gas and charcoal seemed unpractical. Instead, I placed an F crucible, bottom up, in a Hoskins crucible-furnace. Upon this support I placed a charged scorifier. The rapidity with which a very refractory charge melted and scorified was simply amazing to me. Then a cupel was put in the place of the scorifier, the lid was moved sideways, and a blow-pipe was adjusted, just blowing air, since the heat was supplied with gasoline. A thirty-gramme lead button disappeared in three and one-half minutes, the lead oxide volatilizing instead of soaking into the bone ash. I was naturally still more amazed than before. All right so far. But did not the silver also go into the chimney? No; to my still greater amazement, the loss in silver was not much above that of the well-known cupel-draught in the muffle. The preliminary experiments seemed to prove the muffle unnecessary; they were sufficiently encouraging to warrant further expenditure of time and thought. In order to come up to wants, a furnace must permit the making of a number of assays at a time, if necessary, so as to utilize to the utmost the time and working capacity of the assayer. It must, furthermore, permit the simultaneous execution of crucible-fusion, scorifying and cupelling. It must allow roasting, and it must work with either gasoline or gas.

The Furnace.—The furnace designed to satisfy these conditions, according to the experience gained, has a rectangular ground-plan 10 by 22 inches in outside measure, and 5 by 17.5 inches inside measure at the bottom. These dimensions accommodate in one operation six F Battersea crucibles, or six 2.75-inch scorifiers, or six cupels. Fig. 1 is a vertical

FIG. 1.

Vertical Cross-Section of Furnace (scorifying).

cross-section, showing the furnace in the act of scorifying. At 1—1 we see the front and rear walls, tapering from 2.5 inches at the bottom to 2 inches at the top. The rear wall is 10 inches high outside; the front wall only 7.25 inches. Thus the lid (3) has a considerable slant backwards, with a vent-slot at (6). The reason for this slant is this. The flame entering through the rear wall at (4) follows the line of the arrows to the vent. If the lid lay in horizontal position the current of the gases would rebound against it and cause disturbing whirls, whereas now the gases only rebound against the front wall and then expand naturally, yielding their heat more fully. There is neither tendency in the gases to escape through the observation hole at (7) nor through the blast hole at (8). Much heat is wasted through unnecessary contraction of the flames. When the flow of gasoline is properly regulated there is neither pressure nor suction at the blast-hole; so that neither scorifier nor cupel, though standing before the opening, is needlessly ex-

posed to chill. In roasting at a low red heat there is a natural draught from the blast-hole to the vent, which would not be equally advantageous with a horizontal lid. For reasons of easy manipulation, the top edge of the front wall should not be much above the scorifiers and cupels, and this constitutes a further reason for raising the back wall to avoid a crowding of the flame. It is seen that the lids are hinged at (9), and that the hinge-plate is supported upon side brackets, quite independent of the back wall of the furnace. An adjustable counterweight (10) is mounted on each lid in such a manner that a very slight force will either lift the lid or depress it or keep it opened at any desired angle. The four walls form in the present stage of development one piece of non-conducting refractory casing; but a new pattern is contemplated in which the walls will each form a separate, exchangeable piece, they being simply held together by means of two iron bands. An entire sheet-iron outer casing has been tried, but not found of any special advantage. The casing rests upon a 2-inch bottom tile of similar composition as the casing. The bottom plate rests upon a cast-iron frame (11), which is supported by four pipe legs (12) 7 inches high. The feet of the legs are secured to a double forked brace (13), thus making a simple and rigid understructure. Upon the front legs slide two arms (14) with set screws (15). The arms carry a main blast-pipe (16), which can be secured in any desirable position by set screws (17). From this main six branches (18) lead to the blast nozzles. Each branch is furnished with a double swivel-joint stop-cock (19) and a cast-iron handle (20). For the suggestion and design of this iron understructure I am indebted to my friend and colleague, Professor Kidwell. My first furnaces had shorter legs, cast to the bottom frame. The blast main was in front of the bottom tile, bringing the stop-cocks midway up the front wall. With such an arrangement the joints came under the influence of radiating heat, expanded and became loose, unless they were screwed up so tightly that in the cold state they would not move freely.

Each branch is entirely independent of the others, and may be thrown fore and aft without moving its neighbors. The swivel joints allow any horizontal or vertical adjustment of the nozzle with the greatest ease by means of the handle. Since a change is often desirable in the angle at which the air current

FIG. 2.

Vertical Half-Section and Front Half-Elevation.

strikes the surface of the metal in scorifying or cupelling, such change of angle can be effected by lowering or raising the arm bracket (14) along the leg. In the figure this angle is large; the knee at (19) is nearly a right angle. By lowering the arm the knee may be changed to a straight line; the air jet will then be nearly horizontal, a position which is required in roasting, to avoid blowing away ore particles. At (21) stands the bench or bridge, which supports scorifiers, roasting dishes or cupels. It is 8 inches long, 2 inches wide at top, 3 inches at bottom and 3.5 inches high. Any sand crucible, ground to the proper height and placed upside down, could be used as a support in an emergency. In its present form the bench is supported by three legs. The first ones had only two legs. These latter sagged when, after an upset or spill, the scraper was rubbed back and forth over them. The three-legged type wears better.

It has another advantage in affording a fire-brick mass without interfering with the passing of the fire gases. The fire-brick mass acts like a Siemens heat storer. When the furnace is

FIG. 3.

End-Elevation.

used for crucible-fusions this bench is taken out, and when, after the crucible-fusions, cupelling or scorifying is to be done, the bench is simply dropped

*Atlantic City meeting of the American Institute of Mining Engineers, February, 1898.

into place by means of suitable tongs. The clear length of the furnace at the bottom being 18 inches, there is ample room for two benches and the diaphragm (22), Figs. 4 and 5. This diaphragm is a fire-

FIG. 4.

Half Ground-Plan and Half Top-View.

FIG. 5.

Furnace in Isometric Projection—Lids Off.

tile, 0.75-inch thick, just fitting loosely the cross-section of the furnace. I consider it a very important part of the furnace, because it makes either two independent furnaces or one single large furnace. In a very busy office the diaphragm will be discarded, most properly; the whole furnace being used for a time as a roaster, then as a smelter, and lastly as a cupeller. It is for one, two or three assays at a time, that it comes in as an economizer both in time and fuel. In Fig. 4 the bench has not been placed in proper position; it should be reversed, so as to bring the edge, *a b*, towards the front or blast side of the furnace. The figures are readily understood. In Fig. 2 one-half of the furnace is seen as front elevation, showing the position of blast pipes, the tuyeres and the lid. The second half is the vertical section through the bench, without the lid, and with the hole for the burner behind the bench. The center of the latter is located so deep that the flame will not strike against the top of the bench, but only against its central leg, and will then pass sideways against the front wall and up in the direction of the arrows. In Fig. 3 is given the end elevation of the furnace, showing the bracket which supports the hinge plate, and the plugs which close the tuyeres (when the blast is not required), as well as the two observation holes in the lid. The position of the latter indicates its balanced condition. Notice here also the two bands of stovepipe iron which brace the casing. Since the drawing was made, I have found that one single band, only 1-inch wide, is quite sufficient to hold the four sides of the furnace together, because, in experimenting with different refractory mixtures, I have hit upon the right composition, which will give a durable, very refractory, non-friable and non-cracking tile. The two bands are necessary to hold together the fractured or cracked pieces, which are the inevitable outcome of incorrectly composed and over-baked refractory material. In the top view, Fig. 4, attention is specially to be drawn to the manner in which the fire-tile forming the lid is held. The tile is 1.5 inches thick and covers exactly one-half the furnace, including one-half of the diaphragm when the latter is in use. The tile weighs about ten pounds. It is held by the back-piece, *c*, which is cast in one with the eyes *l*, *l'* and the arms *d*, *d'*. The arms are cast hollow and have slots *e e*, *e e*. The pieces *f*, *f* are hooked at one end (see *f*, Fig. 3), the hook gripping under the lower edge of the tile in a recess specially molded in the tile. The other end of *f* slides into the hollow arm *d*, having threaded holes which correspond with the slots *e e*. In this way the tile can be quickly inserted and fastened with the set screws, independently of any slight variations in the size of the tile, avoiding also, as much as possible, heat-radiating iron surfaces. This scheme only works well when the tile is made of the proper material. Such fire tiles as are found usually in the lining of portable furnaces will inevitably crack. I have had a furnace in use since last May, and the lids show no sign yet of any crack. The observation holes (7, 7) are so located that the entire interior of one compartment is visible through them. The perforation through the counterweight (10) is made eccentric. After the lid is counterweighted by means of sliding the weight the nut upon the end of the rod is brought up to the weight. Then, by rotating the weight, the adjustment of the center of gravity is easily performed, a set screw holding the weight against the rod. Fig. 5 shows the furnace in isometric projection with lids

left off. Fig. 6 shows the scorifier tongs. A special tool was found necessary, or, rather, convenient, although any goose-neck tongs of sufficient length can

FIG. 6.

Scorifier-Tongs.

be used. In these special tongs one prong terminates in a circular segment *s*, whose radius is equal to that of the scorifier. Above this segmental ring a thin rod *r* is welded to the prong. The length of this rod slightly exceeds the top diameter of the scorifier. The other prong terminates in a flat round piece perforated by a hole *p*, into which the end of the rod *r* enters, when the grip upon the tongs closes. The rod *r* coming flat down on the edge of the scorifier prevents a tilting of the latter before the ring and the flat have had time to grip. The operator sits in front of the furnace and looks through the tuyere, behind which the scorifier stands. Seeing the tongs, he can adjust the grip. Removing scorifiers from a muffle is simpler, and yet an overtilting is not uncommon. I have not had many mischances, yet I am not quite satisfied, and hope to get some time a more perfect tool. Fig. 7

FIG. 7.

Cupel-Tongs.

shows similar tongs, without cross-bar, for the cupels. There is no difficulty in connection with the lifting or setting of the cupels.

Fig. 1 shows at (4) how the Hoskins disk burner is fitted to any furnace. Both burners are set on the same feed pipe. In working with the gasoline furnaces of Hoskins, every one has the experience that much, if not all, depends upon keeping a strong, as well as a steady, pressure in the supply tank. The hand pump is a nuisance. It more than counteracts the relief which the assayer gets from the absence of stoking a coal or coke fire. A hydrostatic pump avoids the whole trouble. I have found the Cleveland Brass Co.'s pump very satisfactory. It is self-acting and, without question, the most economical source of pressure, wherever a head of water is at the assayer's disposal.

(To be Continued.)

The Stickeen Route a Failure.

A. P. Dennis, member of the engineer corps of the McKenzie-Mann expedition to Telegraph creek and Lake Teslin, has returned to civilization after a vain effort to reach the Yukon country by the all-Canadian route. He says that the trail from Glenora to Teslin, instead of being an open way over a prairie country, as advertised by the Canadian government and its railroad, is nothing but an Indian trail over mountains, through swamps and heavy timber. Travel is practically impossible over the so-called route to the gold fields. Mr. Dennis describes in detail the appalling condition of the 3000 miners, many of whom have lost every cent they had in the world in trying to get to the Klondike by the all-Canadian route. Hundreds of outfits have been lost and many of the stranded miners are approaching a destitute condition. The wail from the Stickeen route began last spring, just before the river opened, and after several hundred miners in small parties and large companies had made the start from Wrangel, hoping to reach Telegraph creek over the ice. Disappointment and hardship was all they encountered. Having been a member of the McKenzie-Mann engineering corps, and being qualified in a technical way to judge of the country and of the feasibility of the route, Mr. Dennis' narrative goes far to show the failure of the all-Canadian route to the Klondike, and that by misrepresentations scattered broadcast through the country thousands of inoffensive men have been lured to undertake a journey in which they had practically no chance to succeed.

"While camped along the trail in the valley of the Little Tahtlan about thirty-five miles from Glenora," says Prof. Dennis, "we were cut off from all communication with the outside world for a period of nearly six weeks. During that time all progress along the trail had ceased on account of the break-up of the river and the condition of the snow on the first summit. By May 15th occasional small outfits in parties of two or three began to dribble through. These men were taking in only a few hundred pounds distributed upon their own backs and upon their dogs. With the drying out of the moss the stream of gold seekers swelled and one could not but marvel at the ingenuity displayed by the Klondikers in their attempts to transport baggage through the wilderness. The roughness and narrowness of the trail demanded the use of one-wheeled vehicles. As a

consequence, unicycles in all shapes and forms were fashioned rudely out of the poor material at hand. Men were tooling various wheelbarrows, wrought in the woods with only an ax for work.

"With a stout man pushing and a well-trained dog pulling, 300 pounds could be taken over the first fifty miles of the trail. No uncommon sight was a wheel 5 or 6 feet in diameter with a load placed in a framework below and to each side of the axle, bringing the center of gravity very low. Such a contrivance required a man in front and one behind, and could carry as high as 500 pounds. Its general appearance is shown in the accompanying illustration.) In some cases a horse might be seen in

A STICKEEN UNICYCLE.

place of a man in front. Here it would require several men to keep the 'go devil' in an upright position, or to hold it back on a heavy down grade. The sharpest grades are the descent to the valleys of the Little and Big Tahtlan rivers respectively. In the case of the latter outfits were lowered by block and tackle down a declivity of 150 feet. By June 1st pack trains were attempting the long pull over, and were finding the trail fairly serviceable for fifty-five miles, or as far as the Shesley river. Here the mountain trail substantially ends and the pathway winds through Willow and Muskeg swamps, out of which mosquitoes rise in sanguinary hordes and plague the wayfarer beyond endurance. Any modern treatise on contemporary martyrology, in order to be comprehensive, should catalogue the experience of men stalled along these stretches of the all-Canadian route to the gold fields.

"Here it begins to look as if only a man in a fever would be foolish enough to dream that he was on a practicable route to the Yukon. Men begin to ask themselves how it was that they got side-tracked in this wilderness and thus lost a whole season in a vain effort to get to the gold mines. Some men will tell you that they wished to thoroughly prospect the Hootalinqua route with their eyes open. Others will tell you that they could not consider Chilkoot or White pass without a shudder; but a majority of the 2000 or 3000 will tell you that they were booked through to Wrangel or Glenora with the impression that a wagon road had been constructed and without the faintest conception of the difficulties that awaited them on leaving the Stickeen river.

"A large proportion, of course, of the stranded miners are from England, Australia and Eastern Canada, but many of the unfortunates are Americans who have trusted unwisely to the reported advantages of this line of ingress to the Yukon."

An Englishman has invented a memorandum clock which will doubtless prove very valuable to the busy business man, who is eternally forgetting his appointments, etc. A mechanism is provided whereby the clock can be "loaded," as it were, with memorandum, which will only come into sight when the precise moment at which they are timed to appear arrives. Thus, by glancing at the clock, the busy man can tell at a glance what is to be done next.

ONE of the most remarkable engineering feats in recent years was the moving of a pier of the new iron bridge of the Northern Pacific at Bismarck, N. D. It took but a minute to move the structure, weighing 9,000,000 pounds, 4 feet, but a year was spent in preparation. An artificial earth slide was used, which carried the huge granite pile on rollers to its new position.

THE Anaconda Company, as usual, was the greatest individual producer of copper during 1897, its output being 131,471,127 pounds. The Calumet & Hecla was second, with 88,378,985 pounds; the Boston & Montana third, with 60,000,000 pounds; the United Verde fourth, with 31,355,025 pounds, and the Copper Queen of Arizona fifth, with 23,999,873 pounds.

It is thought that the three triple expansion crank and fly-wheel pumping engines to be built by a Cincinnati company for the water works of that city, will be the largest machines ever built for any purpose. They will have a capacity for pumping 30,000,000 gallons per day each. Each engine will weigh 1414 tons.

Some Law Points for Inventors.

Fraud is never to be presumed, but must be strictly proven.

The decisions of the courts recognize a radical difference between invention and skill.

The wife is not a competent witness for her husband in an interference case in the Patent Office.

The employer is not entitled to any knowledge of the independent invention of his employe.

A patentee is entitled to all the benefits of his improvement, though he did not foresee some of them.

An invention does not pass absolutely from the domain of experiment until it has actually been used in public.

As between the proprietor of an establishment and his general workmen, the presumption of an invention is with the workmen.

The law looks with indulgence upon delays which arise from the circumstances of the party and demands only reasonable diligence.

The mere fact that a device was patented in a foreign country before it was invented by the applicant is no bar to the grant of a patent to him.

An invention being assets, just the same as the patent itself, it passes at the inventor's death into the hands of his personal representative.

The name of a "patent" cannot be registered as a trade mark after the expiration of the patent, as this would be a virtual extension of the patent.

The labors of a mechanic or model-maker can raise him to the rank of an inventor only in rare cases as against him who had the original conception.

That the change from an old device is an obvious one, requiring only ordinary skill, is no objection to an invention if important advantages result from it.

Although an interference is not the same in nature as an action for infringement, the character of proof required to show the fact of invention is the same.

In the event of a person renewing a forfeited application, he will be subject to contest with any new and successful party whose application has been filed in the interval.

Where there is doubt on the testimony as to which of two contending parties invented a combination, the doubt will be resolved in favor of the first applicant.

It is a well established principle that an inventor has the right to employ the mechanical skill of others to carry out his ideas without forfeiting his right to the invention.

To show that a patent is void because others made the invention before the patentee, it must appear that they had completed it and put it into practical form ready for use.

Delay, no matter how long continued, cannot impair an inventor's right to a patent, unless, by reason of it, another party becomes the first to give the invention to the world.

One who makes a machine goes one step further as a mechanic and manufacturer than he who has made a model; but the law rewards the first inventor rather than the first maker.

Applicants must furnish a description that will tell how the invention is practiced as distinguished from its general theory, and must accompany it with a clear and tangible form of claim.

There is nothing to prevent an inventor from filing an unlimited number of applications for the same subject matter if some benefit, real or imaginary, would seem to justify the additional expense.

Where the difference in degree of diligence in favor of the inventor is the result of superior health and superior means, this will not prevail against his competitor, who is diligent to the extent of his health and means.

The true date of an invention is at the point where the work of the inventor is succeeded by that of the mechanic. Up to that point he was in-

venting, but had not invented, and he must have invented before the law will come to his protection.

A trade mark interference, unlike those for patented matters, has nothing to do with the question as to who was the first to conceive or suggest the mark, but who was the first to put it into actual practice.

Where the inventor, after making a model, took no further steps for five years, although able to apply for a patent, and another in the meantime obtained a patent, the first party was held to have been wanting in diligence.

He who first conceives and gives expression to the idea of an invention in such clear and intelligible manner that a person skilled in the business could construct the thing, is entitled to a patent, provided he use reasonable diligence in perfecting it.

The fact that a party made but a small quantity of an article may be fairly accounted for by showing that there was no demand for it. The discovery by another party of a new use for the article does not affect the prior right of the previous inventor.

It is a well settled fact that if two inventors are on equal terms in respect to the invention, such as partners in the business, and both contribute to the parts of the organization regarded as a whole, the patent would be invalid if issued to one of them.

The manner and the purpose of the payment of the fee required for patents is well understood. It is not in the nature of a tax levied upon inventors, but it is for the purpose of defraying expenses of the examination, and will not be returned on any account.

If an inventor has fully worked out the idea and demonstrated it in some fixed form, and shows by his conduct that he intends to pursue it to a patent and practical use, the law favors his having ample time to improve, adapt, perfect and test his invention before obliging him to come to the Patent Office. For two years he may push its introduction before the public, and manufacture, sell and use it without fear of forfeiture or abandonment, but probably not one inventor in a hundred puts his invention into actual use before applying for a patent.

The fact that property involved is covered by letters patent cannot be urged as a justification of a contract which enhances prices and restrains trade. Patents confer a monopoly as respects property covered by them, but they confer no rights upon the owners of several distinct patents to combine for the purpose of restraining competition and trade. Patent property does not differ in this respect from any other. Such combinations are conspiracies against the public interests and abuses of patent privileges. The object in granting a patent is to promote the public benefit, as well as to reward the inventor.

Long-Distance Steaming of Warships.

The recent performances of the United States battleship Oregon and the gunboat Marietta in steaming from high up along the North American Pacific coast around Cape Horn to the West Indies have very properly challenged the admiration of the whole world. Until quite recently much more had been heard of the failings of warships than of their good points, and one was almost tempted to believe that the average modern naval vessel was so delicately constructed and so complex a piece of machinery as to be scarcely fitted to withstand in due measure the rough usages of war or the knocking about of a protracted sea voyage under the pressure of high speed and with all kinds of weather. When, several years ago, the United States cruiser Columbia crossed over from Southampton to Sandy Hook, at the entrance to New York harbor, in a little less than seven days, racing successfully against one of the crack Atlantic liners, her performance stood unparalleled in naval history. It bordered, in fact, on what had long been considered impossible. What the Ore-

gon and the Marietta have done, however, is a worthy counterpart of that earlier magnificent performance, and admirably demonstrates what may be accomplished by good engineering, even when subjected to the exacting conditions of naval restrictions.

The Wealthiest Nation.

The United States is the wealthiest nation in the world. This is a fact that is often repeated, but because of the natural disposition of the American people to belittle themselves, which has arisen by a kind of reaction from the old disposition to brag and bluster, it seems to be universally forgotten.

The great English statistician, Mulhall, has compiled tables showing the wealth of the nations of the world in 1895 as follows (pounds being converted into dollars at the rate of \$5 per pound):

| | |
|--------------------|------------------|
| United States..... | \$81,750,000,000 |
| Great Britain..... | 59,030,000,000 |
| France..... | 47,950,000,000 |
| Germany..... | 40,360,000,000 |
| Russia..... | 32,125,000,000 |
| Austria..... | 22,560,000,000 |
| Italy..... | 15,800,000,000 |
| Spain..... | 11,900,000,000 |

These figures include everything, such as farms, railways, houses and merchandise.

When annual earnings of the people are taken into consideration—and this is the real security behind a public debt—the lead of the United States is even greater. The earnings of our nation are not far from one-half as great as those of all Europe combined, the figures being \$37,710,000,000 for all Europe (including Asiatic Russia) and \$15,580,000,000 for the United States. The comparative figures for the principal nations are as follows:

| | |
|--------------------|------------------|
| United States..... | \$15,580,000,000 |
| Great Britain..... | 7,115,000,000 |
| Germany..... | 6,402,000,000 |
| France..... | 5,995,000,000 |
| Russia..... | 5,020,000,000 |
| Austria..... | 3,535,000,000 |
| Italy..... | 2,180,000,000 |
| Spain..... | 1,365,000,000 |

Hydraulic Power on Warships.

It has generally been allowed even by those who are most strongly in favor of its adoption that, owing to the conditions which govern the operation of most auxiliaries on board warships, economy must be sacrificed when a hydraulic system is adopted. Hydraulic motors for any of the varied purposes requiring power on warships must be designed large enough to meet the maximum requirements of the service; and if these motors are of the piston or plunger type, the regular form at present in use, the maximum amount of power will always be used, although the minimum work only is required.

If, instead of using a motor having cylinders with moving pistons or rams, utilizing the pressure to obtain power, and measuring out a given quantity of water for each movement, irrespective of the work to be done, the pressure water was applied to a properly designed wheel of the tangential type, an efficiency averaging about 70 per cent could be obtained with a great variation in the load, and thus one source of waste with this system would be avoided.

The direct ram would be still retained for certain purposes where precision of movement is of the first importance, such as in steering gears and gun-training movements.

The mania for direct-acting steam pumps to generate power for such an installation is the most fatal obstacle to be encountered in any effort to reach reasonable economy in a hydraulic system of power transmission on board our warships. In some of the battleships now building it is proposed to install, for the generation of hydraulic power, say six duplex hydraulic pumps of 400 gallons capacity each per minute, at 600 pounds pressure per square inch. This requires twelve steam cylinders, 22 inches in diameter and say 24 inches stroke, being with pump friction about 950 H. P. This will require, with the type of pump proposed, not less than 95,000 pounds of steam per hour, and this certainly would give on the main engines 5000 H. P. Half the

total boiler power of the ship with forced draught would be absorbed by such a pump installation, if working at its full capacity. This is the main reason why hydraulic power is condemned. But there is no reason which we can discover why a hydraulic system of power distribution for all purposes requiring power should not be more economical than steam applied direct, provided ordinary steam pumps are avoided in the generating department and something else than a water meter is used as a motor.—George W. Dickie in Cassier's Magazine for July.

The War and Twine.

Manila hemp, the most valuable of all fibers for cordage purposes, is a production of the Philippine islands, where it is grown in large quantities by small farmers. The plant, called abaca by the islanders, throws up clusters of sheathing leaf stalks from an underground stem, and these grow to a height of 20 to 30 feet, spreading out into a crown of large, undivided leaves, not unlike in characteristics the common plantain of this country. The plant is related to the banana. The plant is cultivated for its fiber alone; it requires very little attention, and at three years of age it flowers and is ready to cut. The stock is then cut down and the sheathing stalks torn asunder and reduced to small strips. These strips in their succulent condition are drawn between a sharp knife-edged instrument and a hard wooden block, to which it is fixed, until all the soft parts surrounding the fiber are removed, and the fiber so cleansed has only to be hung up in the air to dry, when, without further treatment, it is ready for use.

Each stalk yields on an average a little over one pound of fiber, and two natives cutting down plants and separating fiber will prepare not less than twenty-five pounds per day. Though the plant has been introduced into many tropical lands, the cheapness of labor in its native regions has made its cultivation elsewhere unprofitable, and the whole supply comes from Manila and Cuba. One of the chief substitutes for Manila is sisal, a fiber grown in Yucatan in large quantities. It is inferior to the Manila hemp, being more brittle and not as long or as strong in the fiber. The plants from which it is made mature in four or five years, and produce fiber-bearing leaves for forty or fifty years. Hemp has been tried for use on binders, but is not a success, being incapable of resisting the strain, and much more subject to the attacks of mice and insects.

He Failed to Make Gold.

E. C. Brice, who claimed to be able to make gold, has gone, and the \$20,000 building and plant he erected at Thirty-ninth street and Lowe avenue stand idle. He is reported to be suffering from nervous prostration. The plant is said to have been a commercial failure, although P. G. Lamoreaux, who was appointed temporary manager, says the theory is all right. He asserts that the books show where every dollar received by Brice was expended, even to \$1800 he received for stock two weeks ago. It was the dream of his life to make the plant a success. Pressed on all sides by stockholders when the plant was not turning out gold according to expectations, he held them off by his iron will, at all times claiming to be on the verge of success until his money was exhausted. A little over a week ago he acknowledged his system was a failure and asked Mr. Lamoreaux to take hold. Mr. Brice flung himself on the couch in his office and wept like a child.

The shareholders numbered about 300. Many of them were poor people who suffered privations to buy stock. Shares which sold for \$10, their face value, in October rapidly increased in value. By November they were quoted at \$50 and \$75. During December some were sold for \$200 and \$250. Shareholders built air castles and looked over their back yard fences at the stone mansions they would buy. Now they are having a hard time to pay rent.—Chicago Record.

Mining Summary.

CALIFORNIA.

Amador.

Republican: The Anita shaft at Jackson is down 750 feet. For the past two months hard rock has been encountered, which reduced the result of a day's work to 1½ feet; sinking will continue until 1000 feet is attained.—At the Amelia mine water still interferes with work, but every twenty-four hours marks a few feet nearer the desired depth.—The Zella mine will close down for repairs and sinking.—The Onelda, Kennedy and Argonaut are moving along as usual.—Work is progressing at the Tennessee, Douglass and Mason & Griesbach mines in Volcano district. The Reward mine, which has been closed for five weeks, is again under operation.

Butte.

The Oroville Register says that a sulphur property has been discovered near Pentz.—The Last Chance M. Co. have started work on their claim near Elstersee.

Calaveras.

The Ranch mine near Milton has closed down.

It is locally reported that the Sticks mine at Angels will cease operations about Sept. 1st; repairs will cost about \$50,000, including the rebuilding of six miles of the Union flume.

The Ohio mine at Douglas Flat is the only property in the neighborhood having water for operating. Their last cleanup is reported to be satisfactory to the company.

Citizen: It is expected that the California Exploration Co. will unwater the Thorpe mine near San Andreas and resume operations at an early day.—The Demarest mine started up last week.

Echo: Work in the Great Western mine near Angels is progressing. Sinking will be commenced; the mill is not running.—The Woodside mine in Bear Mountain is being worked steadily, but work on the new mill has been discontinued.

El Dorado.

Georgetown Gazette: The Santa Rosa gravel mine, near Volcanoville, has been bonded to W. Simms of Sacramento, and the first payment made.—A tunnel will be run, new machinery added, and operations pushed.—After a successful test with three tanks at the cyanide plant, Taylor mine, the management have decided to erect seventeen additional tanks.

Nugget: At the Griffith Consolidated near Diamond Springs the vertical shaft is down 480 feet and crosscutting is in progress at the 450-foot level. A tunnel is in 1000 feet that is intended to tap the main shaft, and 1600 feet yet remain to be driven before a junction is effected. Levels have been opened at the 138, 250 and 350-foot stations. A new shaft is being sunk 1300 feet south of the main shaft and is down 130 feet; grading is in progress for a 20-stamp mill. An 80 H. P. steam hoist has been erected at the main shaft. A new shaft is also being sunk 800 feet north of the main shaft. A 3-foot ledge of ore has been struck in this shaft, going from \$60 to \$80 per ton. The company now has about 4000 tons of high grade ore on the dump. The Griffith Consolidated embraces nine claims. Sixty men are employed, and the force will be increased.—At the Larkin mine two shafts have been sunk, one 250 feet in depth and one 300 feet. A shoot of good ore 16 feet in width has been cut at the 300-foot level. Good ore is being extracted from the 100 and 200 levels. A 5-stamp mill has been running since last October. Within the next sixty days five and probably ten more stamps will be added to the milling plant. C. H. Dutton is Supt.—At the Crown Point mine the shaft is down 192 feet. The company will sink 300 feet before crosscutting. A tunnel is being driven to connect with the shaft at a depth of 210 feet. The tunnel is 420 feet. Two feet of ore has been encountered in the tunnel. Thirty men are employed. Development work is also being prosecuted on two other claims belonging to this company.—At the Grand Victory mine thirty stamps are crushing sixty-five tons of ore per day. The mill is operated by an 8-foot impulse wheel, under a 7-foot head. The mill and mine are lighted by electricity. The shaft is down 265 feet from the adit level, which is 150 feet from the surface. The ore runs from \$2 to \$10. The ore body on No. 1 level measures 75 feet in height, 120 feet in length and 130 feet average width. Four veins have been encountered which contain 60 per cent of ore.

Kern.

The Wedge and the Butte mines at Johannesburg are shipping ore to Red Dog mill.—T. D. Vandevort, on the Golden Rule mine, is taking out paying rock.—The Red Dog mill completed a 550-ton run for the Yellow Aster Co. The mill averaged about twenty-five tons per day.—Work has commenced anew on the Pinmore mine; several carloads of ore will be shipped to Barstow for a test run, and if the results are satisfactory, work will be continued and a 10-stamp mill erected at the mine.

Mariposa.

Supt. Kennedy of the Campodonico mine, Hornitos, has resumed work with a full force.

Nevada.

The shaft of the Texas mine, near Nevada City, is down 250 feet, at which depth drifts are being run. Three eight-hour shifts are working.—Work has begun on the Lindsay mine, near Maybent, which is under bond to a St. Louis company.—The Eagle Bird is running day and night, both mine and mill. Work has been temporarily suspended at the Red Dog drift mine near Yuba Bet.

Herold: J. S. Goodwin contemplates fitting up his hydraulic mine at Red Dog.

Transcript: Tributers are finding some good ore on the 1000-foot level of the Pittsburg mine near Nevada City.—A test run on ore from the Mineral mine at Moor's Flat

gave results that warrant continuance of development work.

Placer.

Kulver & Hall have begun operations near Dutch Flat. They will run a bedrock tunnel 400 feet.

Plumas.

The legal entanglements in which the Bullion mine at Mohawk was involved have been adjusted. Under the superintendence of H. H. Bence work in the mine has been resumed.

Riverside.

At the placer camp in the Pintos the dry washers who are on the pay streak are making good runs. One nugget of \$38 and another of \$76 were found.

San Diego.

Good ore in an 18-foot ledge has been found in the Ranchita mine at Banner. The cyanide plant at the Cargo Muchacho mine, near Ogilby, is handling 100 tons of tailings per day.

Shasta.

The Redding Searchlight says that a cinnabar property is being developed near Millville in which a ledge several feet wide has been traced 600 feet.

Sierra.

C. B. Wright advertises the sale at public auction of the Thistle Shaft mine, near Gibsons, under authority of a trust deed, July 14th, at Quincy.

Siskiyou.

News: Mining at Bentz Bar is being done by a Chinese company.—The Quinn & McConnell mine near Yreka is operated night and day by twenty-five men with good results.—Work at Big Bar is progressing under the superintendence of E. Mathewson.—The Beasy Bar mine is employing twenty-five men with prospect of a good season's run.—The Pacific mine began hoisting gravel. They have good prospects.—Spengler Bros. are working at the mouth of Humbug. They will make a good season if the water holds out.—The Shurtliff mill on the north fork of Humbug is running on good ore.

Journal: J. G. Waugh is working a placer claim on Beacon creek in the Siskiyou foothills that gives good yield, but as he has no water he is storing the dirt for winter rains.

F. Le May is taking out good quartz in the Cape mine on Greenhorn. The ore carries gold and copper.—The Lone Jack mine near Hornbrook, because of scarcity of water, is putting in a steam plant to run the 20-stamp mill.—The Hazel G. M. Co. is taking out good ore.—In the Sound Money mine the tunnel has reached 480 feet and considerable ore is ready for crushing.—On the California Queen fifty men are employed.

Journal: The Williams & Wademan mine, on Greenhorn, had a few tons of ore crushed which paid well. The ledge prospects very evenly throughout, but is narrow.—The river miners on the Klamath, in Honolulu district, are all hoisting pay gravel. The Pacific mine, at mouth of Humbug, is worked day and night with large force. Other claims on the river are also being worked in similar manner all the way from Shasta river to Gottle.—Jillson & Co. have added five stamps to their quartz mill near Henley, and will soon be ready to run by steam, as water is getting short for power. They have realized so far this season from 154 tons crushed about \$15,000.—The Distlehorst & Barton dredger in Klamath river, near Oak Bar, continues to raise good pay gravel, and will take out considerable all summer.—Barton & Co. are doing well in their river claim near Oak Bar, which is fitted up for successful working.

Trinity.

Journal: The dredger at Lowdens will be running in a short time. The machinery is all in place. They have had steam up several times testing the pipes and different parts of machinery. It is run by three engines and a 150 H. P. boiler; a dynamo will be used to furnish light.—The output of the Altona quick-silver mine at Cinnabar for June was 500 flasks.

Tuolumne.

The Arbona mine, at Tutletown, contemplates sinking a 500-foot shaft.—At the Gerrymander near Sonora sinking and drifting continue. The shaft has reached 110 feet and will be driven to 500 feet depth. At another point in the mine a vein 12 feet wide has been uncovered.

Littlefield & Fisher on the Densmore, near Parrott's Ferry, are developing the property with ten miners. The shaft shows a 4-foot vein of quartz. The ore is being hauled to Sonora and run through the reduction works. All of the rock so far encountered is of very high grade, and despite the fact that it is quite rebellious and the expenses of extraction, hauling and reduction are high, yields a handsome surplus. A mill will in all probability be shortly put up at the mine.—At the Agnes mine near Soulsville operations were resumed this week, W. H. Storms, Supt.

Independent: The tunnel at La Estrella mine near Sonora is in 315 feet.—At the Maine mine the vein matter is 2 feet 8 inches in width.—The Gerrymander M. Co. and Sherman & Wetmore have brought action in the Superior Court against the Golden Gate M. Co. for \$150,000 damages and costs of suit.

M. Cleveland will commence work on the mine bonded from W. Grundy at Big Oak Flat.—The Longfellow mill remains closed. Three men are working at the mine.

Magnet: The Seminole mine near Carters has been unwatered and Supt. Kirby will put a force to work.—The Lady Washington Co. is shipping 300 tons of ore.—W. D. Bannister & Co. have purchased the mining claim on Gold hill known as the White Lead gravel mine. They will put up pumping machinery and sink the shaft, now down 120 feet, to bedrock. There has never been any deep mining done to demonstrate the extent of this gravel deposit, the early miners being content to abandon the workings as soon as water was

encountered.—C. W. Ayers, having secured a working bond on 255 acres of gravel lands in the vicinity of Montezuma, has put ten men to work.

Union-Democrat: At the Golden Gate the lower levels have been temporarily abandoned and all work is concentrated above the 500. Eighty-five men are on the pay roll.

Yuba.

H. Visscher is in charge of operations at the Narrows, near Smartsville, by the U. S. Debris Commission, to determine upon a site for the proposed debris restraining dam. From thirty to forty men have been employed there several months, sinking and trenching for bedrock. The explorations show there are in the 4000-foot gorge, known as the Narrows, at least three good sites. The funds on hand are nearly exhausted.

NEVADA.

Placer miners in Van Duser district, Elko county, are said to be making \$7 per day with a small head of water.

The Gold Crown mine at Aurum has shipped a carload of ore which averaged 95 ounces silver per ton.

The Magnolia mine at De Lamar recently marketed a carload of gold ore for which they received \$210 per ton net. This is the third shipment. A mill will be built at the mine next spring. Its completion will give De Lamar three mills and increase the output of that camp to over 100 tons a day.

The North Mountain M. Co.'s mill and mine at Egan are running full capacity. The mill is now crushing sixty tons per day.

Tuscarora Review: Notwithstanding the recent addition of tanks to the Dexter cyanide plant, nearly doubling its capacity, the new mill is producing tailings so rapidly that it is taxing the plant to its utmost to keep up. There are now ten circular tanks, holding thirty cars each, and four square tanks with a capacity of about ninety cars each. At present about 150 cars a day are being leached.—The De Lamar Co. is putting in four more leaching tanks 200x40 feet.

Pioche Record: J. E. Price has brought suit for himself and J. Sneath against the Nevada M. Co. for \$850, and attached the property of the company. The result was a shutdown at both mine and mill. The company is a local concern operating the Yuba mine and the mill of the Pioche Co. Co., and is involved for \$15,000.—English capitalists have agents in Nye county inspecting mining properties.

OREGON.

The Lewis-Hampton M. Co. of Josephine county is building fourteen miles of ditch, which will be completed Sept. 1.—The Willow Springs mine near Medford has struck a body of good ore.—Beekman & Huffer, who have been taking out a large quantity of ore from their mine in Shively Gulch district, have struck a new body of good value.

WASHINGTON.

The Horace Co. has resumed work near Republic. Samples taken from the various cuts show that the pay streak is about 10 feet wide and averages \$16 per ton.

G. B. Henton found in the Swauk mine, near Ellensburg, a nugget that weighs 27 ounces.

The cross-cut tunnel on the Eureka Queen at Republic is in 147 feet. The Erdmann tunnel is in 60 feet, and a contract has been let for 40 feet more.—Two shifts are at work on the Ben Hur. A 124 foot tunnel has partially crosscut the ledge at a depth of 120 feet.

The Young America concentrator at Bossburg is being pushed to completion. The Bonanza mine is shipping ore at the rate of 100 tons per month.—The Uncle Sam has shipped the first carload of ore.—Four properties on Toulon mountain are being worked with full forces. The Scotia reports a strike. The Brown-Reese mine has four carloads of ore on the dump, and is taking out shipping ore at every blast.—At Fruitland an 8-foot lead has been struck in the Mountain Queen mine, assaying 1000 ounces silver.—In the Chloride and Rattler a vein of copper, silver and gold ore was discovered.

The Indian bill, carrying with it the opening of the south half of the Colville Indian reservation to mineral entry, is signed by the President, and there was on the 1st a stampede from points in northeastern Washington for the borders of the reservation. It is estimated that 3000 people have crossed into the reservation preparatory to locating mining claims.

BRITISH COLUMBIA.

In the Velvet mine, near Rossland, the drift has been driven in ore for a distance of 200 feet, 4 feet wide. Samples of ore assayed \$32 in gold and 24 per cent copper.—Four thousand feet of the Noble Five air-pipe line has been laid. A compressor will be installed.

The strike in the 300 level of the Monte Cristo has widened to 11 feet of shipping ore. It will average \$25 across the 11 feet. The output last week was sixty tons. The compressor on the Monte Cristo keeps two drills going on the Monte Cristo and two on the Virginia. It also keeps one hoist and one pump going on both these properties. As soon as the Power & Light Co. puts in its plant, an electric hoist will be installed and more drills put in.—Last week ore shipments from Rossland were 1712 tons. Total since Jan. 1, 112,505 tons.

The Trail smelter will start next week and will handle 250 tons of ore daily; 125 men will be employed in the smelter. It has been receiving ore steadily ever since its acquisition by the Canadian Pacific railroad and there are thousands of tons on hand. Work is proceeding as rapidly as possible with the construction of new blasts.—Work on the Jackson mines near Kaslo has been discontinued pending the installment of the new compressor plant and other machinery. When work stopped at 475 feet depth there was 4 inches of high grade galena besides a quan-

tity of concentrating ore.—Work has begun on a 200-foot tunnel on the Golden Eagle near Grand Forks.—It is asserted that \$50,000 will be spent this summer in development work on the Oro Denero, in which J. M. Burke of Spokane is interested.—Beaton Bros. sold the Jenny Lind and Golden Gate claims to McMillin & Merced, who represent English capital, for \$7000 cash. This property is on the Salmon river near Ymir, and the ore runs in gold and copper.

A strike has been made in the Monte Cristo, which has been crosscut for a distance of 10 feet. The ore will average over \$30 per ton.

THE KLONDIKE.

The tug New England has arrived from St. Michaels with eighteen returning Klondikers and about \$100,000 in gold. They say that twelve other miners are at St. Michaels awaiting a chance to come south. The ice left St. Michaels harbor on June 17th. The Yukon river is 8 feet higher than it was ever known to be in its history. Out of 1500 claims that have been recorded in Dawson district less than 200 have proved to be paying property.

UTAH.

The Silver King vein at Park City is said to be 400 feet in width, carrying values in silver, lead and a little gold that net \$60 per ton. Keith & Kerns are said to have offered to make a contract with the Philadelphia Smelting Co. to furnish 25,000 tons of ore per year for five years. Last year the property paid \$500,000 in dividends, with 125 men on dead work and 35 men in ore.

The increase in tonnage in the various camps during the first half of the present year is estimated to be 45 per cent and the belief is expressed that a corresponding increase will be maintained during the balance of the year. The Tribune says that the Golden Gate alone has added 400 tons to the daily record of that which is put through the respective crushing plants.

The Silver City Star says thirty-six carloads of ore were shipped from there last week.—Bingham shipments for the week amounted to 3673 tons.

The shaft off the tunnel level of the Ajax at Mammoth has reached a depth of 500 feet. It will be continued to the 600-foot level before prospecting will commence.—Near Milford the Montreal mine made a shipment of ore.—In the Gothard and Hickory ore has been found that runs from 9 to 40 per cent copper.

The Treasurer Hill, Silver City, marketed twenty-six tons of ore that netted \$2600; the shipment is from the new strike in the property.—At Marysvale the antimony properties have resumed work under a contract to furnish a carload of ore per day. The Mammoth shaft at Mammoth has reached the 1700-foot level.—The Swan Baines mill at Bingham has started and has an abundance of ore.—At the Martha Washington, Tintic, from which ore shipments had ceased during the erection of machinery the hoisting of ore has been resumed.

Tribune: Two new discoveries of ore were made in the Mercur mine, Mercur, at places far apart. The discoveries at points so far distant from the main workings in the company's ground practically give it two new mines, and to test its milling values ore is now being taken out for the tanks.—The property of the Sunshine M. Co. at Sunshine has been leased to C. H. Jacobs, and everything indicates that work will be resumed.—Samples from the Highland Boy mine at Bingham shows from 14 to 30 per cent copper and as much as \$90 in gold per ton, and yet the ore comes from a zone, the presence of which is a surprise to the company. The ground had sold for the gold dollars it had been shown to contain, not for the ingots of copper which the company is taking out.

Tintic Miner: In the Picnic mine at Silver City three shifts are at work. The shaft has reached 450 feet and will be continued 200 feet additional.

IDAHO.

The Tip Top mine near Hailey has reached 300 feet depth. The mill is running on \$20 ore.—Work is to be resumed on the Custer near Wallace. When the Custer was one of the steady producers of the Coeur d'Alenes the ore above the tunnel was pretty well worked out and sinking commenced. The shaft was put down over 100 feet and considerable stoping done. A tunnel has been driven 1600 feet. When the shutdown came these workings were allowed to fill with water and nothing has been done since.—The Mammoth is increasing its ore shipments rapidly. A month ago three cars of ore was the regular shipment. During the past week it has shipped six cars daily.—The Cumberland mine near Silver City is milling ten tons of ore per day that yields \$100 per ton.—Unwatering the Empire mine progresses.—A Pittsburg company that has had a bond on the Sweet mines near Basin has paid \$6000 down and is operating extensively. The amount for which the property was sold is said to be \$40,000. The group consists of nine claims. There are ten 50-foot shafts and one 232 feet. Two tunnels have been run 100 feet each, while a third is 1870 feet long. This latter cuts the vein at a depth of 700 feet. Three shifts are engaged. The ore is low grade but free milling. The new owners propose to construct a mill two miles below the mine. It will be run by electricity and be connected by a tram. J. T. Keegan is Supt.—Five new companies have taken hold of properties at Basin—two dredge companies, the Twin Springs Co. and the companies controlling the New York and Lucky Boy mines. Most of the ore is low grade. Electricity and modern methods of treatment will be used.—At the Reber mine near Mountain Home they are crushing twenty tons of ore per day and save about 90 per cent of the gold.

The Checkmate of Willow Springs is making two shipments per month of a carload of high grade ore.—Work has begun on the Bunch and Carpenter quartz properties near Idaho

City.—The Jay Gould mine at Hailey shipped a carload of ore.

MONTANA.

A Chicago company has bonded the Little Katie mine near Clancy for \$10,000 and begun work.—The Tallaquah mine is being unwatered and sinking will be resumed.—The Montana G. S. Co. are building a dredge on the Cope placers near Dillon. They expect to have it in operation Sept. 1. If this proves a success the company will build four more boats next season. E. L. Hall is Supt.

The London, one of the biggest silver-lead propositions of Nelhart, has been leased to J. McAssey and associates. The mine has a large ore body blocked out, and while it is not a high-grade silver mine it can be worked so cheaply and so much ore taken out, combined with the amount of lead, that the men leasing it believe they can make it pay. The mine has lain idle for years.

The leasers of the Arkansas mine at Revenue shipped twelve tons of high grade ore.—Johnson & Co. shipped a carload of ore from the Columbus, which proved satisfactory.

Ham & Co. shipped a carload of ore from Sterling that netted \$60 a ton.—The Revenue is producing forty tons a day.

A check for \$41,232.22, in payment of judgment with interest in the Blackrock-Niagara mining suit, has been deposited with Clerk Clark of the District Court at Butte. The action was tried in 1895 and has been to the Supreme Court.

Montana's total copper output for 1897 was 237,158,540 pounds or nearly 50 per cent of the total product of the United States. The increase over 1896 is over 8,000,000 pounds.

The Boston & Montana Co. is shipping regularly. The company is enlarging the plant at Great Falls and before winter it is likely that the whole plant will be in operation, its capacity to be increased about one-third.

There is a report again that the Butte & Boston will take charge of the Butte smelting plant some time in July, but the report is not generally credited in Butte. The company is hoisting about 200 tons daily of low-grade ore and a little high grade from the Harrington placer.

Butte Miner: It is reported that the work will resume on the Vulcan mine, a silver property at Butte, which has been a great producer in the days when silver brought \$1.29 per ounce. It has a shaft 400 feet, full of water.—Mgr. Buzzo of the Alice at Walkerville makes regular shipments of gold and silver bullion to San Francisco. There is no thought of ceasing operations. Some rich ground has been opened in the Alice mine which has been a producer for many years. In the Blue Wing which has reached a depth of 700 feet some high grade ore is being hoisted which carries some gold as well as silver. Last year a large amount of high grade gold and silver ore was hoisted, some of it running \$40 to the ton in gold and 500 ounces in silver.—The Monitor Tunnel Co. which was reorganized, it is reported, will soon commence development work on the Monitor mine. Butte people are interested with some Chicago capitalists.

Lee & Co. have leased their Madison mine, near Twin Bridges, to Wright & Hayes for \$30,000.

WYOMING.

M. W. Harrington and associates will build a sampling and reduction plant at Grand Encampment.

At South Pass, in the Empire State mine, work is progressing.—The Carrissa mine was sold to Eastern people and work is pushed on a large scale.—E. N. Breitung has bought the Albany placer mines, near Cheyenne, and will operate them.

In the Portland mine, at Grand Encampment, the second grade ore runs \$20 in gold and copper.—Screenings from the Doane dump carries 21 per cent of copper and \$4 in gold.—The Gertrude produces ten tons of ore daily which averages \$10 in gold per ton.—The Charter Oak has 500 tons of ore on the dump. The ore body averages 12 feet in width; its value is 11 per cent copper and \$4 in gold.

SOUTH DAKOTA.

A Colorado company, headed by M. Weber, has bought seventy claims near Custer for \$250,000, payable 10 per cent August 15, the balance in six months. F. W. Bush becomes Supt.

MICHIGAN.

Michigan Copper M. Co., capital \$2,500,000, 100,000 shares, has been organized. The property consists of the old Minnesota and Rockland mines of Ontonagon county, comprising 4720 acres.

ONTARIO.

The Bully Boy mine at Rat Portage at the 125-foot level has a vein 4 feet wide.—The Nora mine, on Ptarmigan bay, is down 137 feet. The vein at that depth is 5 feet wide, and gives good assay values.

COLORADO.

In a case recently tried in the District Court, Leadville, there was an important decision rendered fixing the right of lode claimants to prospect placer grounds. The court held that the location of the placer mining claim gives exclusive right to possession, and until it is abandoned a prospector cannot enter upon the claim for the purpose of discovering a lode claim that may be within the limits of the placer. The question as to the right of a lode owner to work his vein (discovered on the outside of the placer) into the placer was not decided, and remains a mooted question among mining men.

The Electric Company of Lafayette has incorporated, capital stock \$200,000, to introduce into the Northern Colorado coal fields a new plan for lighting the mines, substituting incandescent lamps for the oil lamps now in use among the various operators.

BOULDER COUNTY.

The Rip Van Dam mine in Springdale dis-

trict is in good ore. The streak is several inches wide of nearly solid tellurium.—In Wall Street district the Doss is shipping. The Last Chance is stopping. The Franklin has opened 3 feet of ore running from \$30 to \$75 gold and from \$25 to \$300 in silver. The Forest has several carloads ready for shipment as soon as the tramway is completed. The camp is an old one, but it is showing new vigor.

The Telephone mine in Ward district will resume work as soon as unwatered. A steam plant will be put up and sinking begun.

The Intercean mine, Sunshine, is worked almost entirely by leasers, who are making good wages. Occasional strikes of ore are made that run as high as \$75 and \$100 per pound in gold.—The Emancipation mine is making an output of about fifty tons of telluride per month, which pays the proprietors a good profit. After years of litigation and final abandonment of the mine an English syndicate was induced to take hold of the property. Good machinery was placed for hoisting, pumping and thoroughly testing the quality and quantity of the mineral produced at an expense of about \$15,000. The payments were not made at the specified periods and the machinery and improvements reverted to the original owners. The mine to-day is paying big.

The Village Belle mine at Eldora is getting out shipping ore of \$40 to \$60 per ton.—The Clara has developed a large ore body, which will be cut by the Mogul tunnel at a depth of 1000 feet.—Ward mining camp claims an output of 500 tons of ore per day, of which fifty tons is an \$80 smelting ore that is shipped to the smelters, and 450 tons is milling ore that will average \$10 per ton, which is treated in local mills or left on the dump. There are eleven mills in the district that aggregate 170 stamps, seventy-five of which are dropping.

CHAFFEE COUNTY.

The copper matte smelter at Buena Vista was blown in and is running at its full capacity of 150 tons a day. It was erected by a party of Chester, Pa., capitalists, who have a lease on the old Mary Murphy mine at Romley for the treatment of their own ores. The smelter was originally designed to use a hot blast, but this has been discarded, and it is running with a cold blast. A large amount of outside ores will be treated, and it is expected that a number of properties in this vicinity will be operated. The smelter employs twenty-five men. Electric power is used to run the blowers and hoist. The electricity is generated by twin turbines. The plant has cost about \$40,000.

A mill will be erected both at Salida and on Cameron flats. Out of \$8 ore, it is claimed that a value of \$7.20 per ton is obtained, giving a saving on low-grade ore of 90 per cent. In ore that runs upward of \$500 to the ton 98 per cent is saved.

CLEAR CREEK COUNTY.

The Lamartine mine at Idaho Springs which has been a silver producer is being opened in the lower leads where the vein has changed from silver to gold values. The work is almost entirely in new ground.—The Chocapeake tunnel is in 600 feet. The tunnel is driving for a group of gold claims, all of which have been opened at the surface.—The Albro and Lee mines at Dumont are being worked steadily and furnishing good profits. One shipment gave \$70 gold, \$14 silver and 5 per cent copper per ton. The concentrates give \$40 per ton.

CUSTER COUNTY.

Lead mining at Ilse, which is the only place in the State where mining for lead alone is done, has been resumed after a rest for some years. The ore there is a lead carbonate, carrying neither gold nor silver.

EAGLE COUNTY.

The old Ground Hog mine, at Red Cliff, which was supposed to be worked out, is again in good ore. Leasers recently shipped a car of ore which ran nearly \$20,000.

EL PASO COUNTY.

The Badger Boy mine, near Cripple Creek, is to be the first in the district operated by electricity. The Raven tunnel is in 3300 feet, and in 15 feet it will reach the connection from the Elkton side of the mountain. The amount of work in the tunnel and other development work, during which but little attention was paid to outputting, accounts for the property only shipping seventy tons per week.

A 40-ton smelter is being built at Woodland Park.—The lessees operating the Free Coinage properties, Cripple Creek, have four producing shafts. The Pinto is a regular shipper. Most of the ore is of medium grade, but there is one streak of sylvanite that runs as high as \$700 in places. The lessees on the Pueblo, another Free Coinage claim, are shipping ten tons per day.—The Pharmacist mine shipped sixty tons of \$30 milling ore and thirty tons of smelting ore that will run over \$80 per ton. In a crosscut from the 175-foot station in the shaft they caught 2 feet of ore that will average \$80 per ton without assorting. Four inches of sylvanite ore in the vein runs \$500 per ton.

Investor: The total amount shipped from the Anchoria-Leland properties last week was in the neighborhood of 125 tons, all of smelting grade.—Following are shipments credited to the Matoa the past few days: 56½ tons, net value \$2435.86; 54½ tons, \$1489.96; 55 tons, \$1475.59; 54 tons, \$2234.47.

In the Modoc the chute at the 600-foot level is not long, but the ore is rich and the pay streak wide. In places there is 12 feet of ore that is good from ten to fifteen ounces without sorting. Picked samples of the ore show sylvanite in large quantities.

Denver Republican: Probably the most valuable single shipment of ore sent out from Victor district was made by the Portland Co. It approximated \$200,000; some of it ran as high as \$50,000 per ton. The ore was mined in the ground belonging to the Portland Co. known as the Hidden Treasure.—The Stand-

ard tunnel, which was started for the purpose of draining the Elkton and other mines as well as developing ore, has been added to the list of shippers. The company is breaking ore from a 4-foot vein that carries good values. The tunnel is in about 1000 feet. Most of the Standard stock is owned by officials of the Standard Oil Co.—The sorted ore from the dumps is making business for the stamp mills, and at least two that have been closed since last summer have resumed.

GILPIN COUNTY.

Development work is being done in the Mountain Rose, Packard gulch. Their mill returns give an average of \$20 per ton.

GUNNISON COUNTY.

The Daisy mine, Crystal district, has seventy-five burros packing ore to the smelters. The shipments amount to twenty tons daily.

HINSDALE COUNTY.

The Barrett claim in Burrows park is shipping its winter and spring output. The property has been working for three years and has made a number of small shipments of pay ore. The present shipment is four carloads of high-grade ore.

LAKE COUNTY.

The Resurrection mine, Leadville, is working 100 men. The shaft is 800 feet deep. The water, which comes in at the rate of 150 gallons per hour, is handled through the Grand View incline. The output of the mine is increasing.—Last week in the long drift of the Mab Shaft, at a depth of 1000 feet, the ore chute was opened. It is the same as the Mahala ore chute, which was 100 feet wide and 50 feet deep.—Mgr. Bulkeley is pushing development work on the Ibex combination, and has about 400 men on the payroll, which calls for a monthly expenditure of over \$35,000. Shipments at the Ibex continue at 250 tons per day, of which amount two-thirds is a sulphide and the remainder oxide. No. 5 shaft is also going after the lower ore bodies, and will be the deepest shaft on the property. It has reached a depth of 800 feet. All of the water of the Ibex combination drains to No. 3 shaft, from which point the pumping plant has no difficulty in handling the water flow, which is about 500 gallons per minute.

It is stated that D. H. Moffat will resume work on his Louisville mine at Leadville. The shaft is down 900 feet, but it will go down to 1200 or 1300 feet. The Louisville has paid \$4,000,000 in dividends.

LA PLATA COUNTY.

A test of 9300 pounds of Tenderfoot ore, La Plata district, gave 1500 pounds of concentrates and a 6½-ounce gold retort. The concentrates assayed two and a half ounces gold per ton, and the tailings \$8 per ton.

PARK COUNTY.

In the Mable Grace mine, in the Freshwater district, the shaft has been sunk on a body of mineral so large that the 5½-foot shaft has not touched a wall. Ore has been tested that ran \$125 in gold and \$3 in silver.

A body of copper has been discovered on the Little Platte, near Fairplay. It is reported to run 8 per cent copper and a little gold and silver.

SAGUACHE COUNTY.

In the Lord Kinney mine, at Crestone, a 12-inch streak of galena was uncovered that yields thirty-five ounces in silver, \$3 in gold and 55 per cent lead.

SAN JUAN COUNTY.

In the Irene mine, near Eureka, a 7-inch streak of ore has been found that runs 275 ounces in silver and 55 per cent lead.—The Ridgeway, near Silverton, has disclosed a new chute, the ore from which assays nine ounces in gold and 450 ounces in silver per ton.—The Hancock mine, on Cement creek, is being operated successfully by lessees. They have opened a mineralized vein, the pay streak of which is 6 inches wide and carries values varying from 44 to 62 per cent lead and 52 to 135 ounces of silver per ton.—Among the silver producers maintaining a steady output with profits is the Alta, in Gold King basin; the vein is large, is easily handled, the output is large, and the ore is of a character that receives cheap treatment. It is profitable, even at the present price of silver.

The Silver Ledge mill, at Silverton, is outputting a carload of concentrates daily. It is reported that a 4-inch streak of tellurium has been discovered in the mine.—The Snowshoe of South Lookout gives returns from a 2-inch streak of quartz of one-half ounce gold, twenty-eight ounces silver and 30 per cent lead.

SAN MIGUEL COUNTY.

In the North Chicago mine, near Telluride, at 200 feet a vein was cut, and has been cross-cut in mineralized vein matter 10 feet from the footwall without reaching the hanging wall. Two feet of quartz taken from the foot wall ran \$215.20 per ton in gold and silver.—Saw Pit has three regular shipping mines that are sending out a daily product to the smelters. The difficulty which existed at the Jim Corbett has been adjusted and a car a day is going out. The Iron Cap is also sending out a good product as development pushes ahead. The Belle-Champion has a large body of ore blocked out since resuming operations, and has begun shipping. The Lizzie G. expects to complete the tunnel being driven to cut the big ore body in a short time, and this will add another car a day to the output.

Two years ago the Tom Boy mine at Telluride built up a record which brought about its sale for a large sum. A few months later, from causes or reasons which have never been publicly ascertained, the product began to fall off, and after a time the mine closed down. The belief gained ground that it had exhausted its wealth. This, though, did not lie with the owners, and work was again started and an extensive amount of development done. From this time on good reports were had of the success of this work. This spring the mill of 175 tons capacity was again put in operation, and as soon as the water supply would

permit, treated its full limit of ore every twenty-four hours. Recently a large ore body was opened up in the lower workings, and the mill is now unable to take care of the output.

SUMMIT COUNTY.

The old Robinson mine, at Robinson, which has a record of \$3,000,000 of ore sales, is now being worked by Leadville people. Thirty tons per day is being shipped to the smelters.

The El Dorado, in the Ten-mile district, is shipping pay ore, and the White Quail, one of the old mines of the district, has resumed shipments, which are a lead carbonate.

NEW MEXICO.

The Tyroler Tunnel Co. has resumed work upon the Tyroler and Elizabeth claims at Hematite. They have a tunnel in 350 feet, showing a 6-foot vein of good ore.—Work on the quicksilver deposits in the southern part of Brewster county continues with promising results.—The smelter at Kingston is again in operation.—The 30-stamp mill of the Helen Co. is running on ore from the Confidence mine, near Silver City.—The Othello and Desdemona mines at Cook's peak supply daily from 70 to 100 tons of lead carbonates.

The Chicago people who had a bond on the Western Belle mine at Gold Hill have suspended operations. The bond has expired and the owners refuse to renew it.—The Pinos Altos G. M. Co. at Pinos Altos has a large force on development work in its several mines. The mill is constantly at work on ore taken from the shafts and drifts in development work, no stopping being done. The Gillette shaft is over 700 feet in depth and will be continued to 1000 feet. It is necessary that an extensive reduction plant be built before the extraction of ore from the stopes is commenced, as the present plant is inadequate.—At the Atlantic mine sinking has been resumed below the 450-foot level. The shaft will be sunk to 750 feet and levels run at 600 feet and 750 feet.

The Santa Rita copper mines ship from 600 to 1200 tons of ore to the smelter each month.

The Confidence mine, at Mogollon, is working seventy men and producing eighty tons of ore per day.—D. B. Gillette Jr., Mgr. Pinos Altos G. M. Co., has leased a large area of the Santa Rita Copper & Iron Co.'s property.—The Mystic, a Baldy mountain property, has been leased to M. C. Ferris under a bond of \$36,000. He agrees to work fifty shifts per month.—Capt. T. Brannigan, receiver of the Modoc group at Las Cruces, is conducting the operations of the property.—The Cochiti Co. has 4500 tons of ore on the dump, most of which is said to average \$11 a ton.

Placer mining near La Belle is in operation. In Foreman gulch and Bitter creek a large force is working. A company is working the Urraca placers and the Monte Cristo M. Co. is working a force. The Grouse gulch miners have resumed work on their placers. The Carmichael Placer Co., near Red river, made their first clean-up. The Galisteo M. Co. has begun operations.

ARIZONA.

(Special Correspondence).—J. Murphy expects to sell his Pay Roll mine at Chloride to Denver men for \$35,000.

The Tennessee mine has a new hoisting plant from San Francisco. The main shaft is down 350 feet. The mine is a regular shipper to Denver and other points in Colorado.

Last month placer gold was discovered five miles below Kingman, by the McGuire Bros. and McKesson, in the Wallapai mountains. Since then they have been at work with both dry-washer and rocker, and are taking out more than miner's wages in good coarse gold. For the rocker they haul the water from the McGuire goat ranch two miles.

Old Mineral Park, which was once the county seat of Mohave county, is fast acquiring new immigration on account of some reported rich discoveries of native silver in unexpected quantities. These discoveries have been made in old and abandoned workings, and give promise of activity again in the old district.

Kingman, July 6th, '98.

The World's Fair mine near Crittenden shipped two carloads of ore which assayed 800 ounces of silver per ton and netted \$7200.—The Tucson sampling works, which have been closed nearly two years, have resumed operations. The Citizen says that the revival in the mining industry will keep its plant in operation to its full capacity.

A 3-foot strike of good ore was made in the Erie mine, Cedar district, Mohave county.—The Oro Plata near Cerbat is said to be the largest ore shipper in Mohave county. O. B. Hardy is pushing development on the Pena Blanco mine in the Oro Blanco country and shipping two carloads of ore weekly.—It runs about 65 per cent lead with some silver.

A new formation was struck in the South Bisbee Co.'s shaft at a depth of 175 feet of decomposed iron and lead.

The Black Warrior Copper Co. is reported to have made an extensive strike on the Montgomery lode near Globe. It is said that there are 30,000 tons of ore in sight.

At the Gold Rock mine near Yuma almost 600 tons of ore are crushed daily by the 140 stamps in operation.—The Arizona Copper Co. at Clifton contemplates adding to its reduction plant two 150-ton concentrators and a new furnace.—A new strike of good ore is reported in new ground of the Azurite copper mine near Tucson.

Yavapai county has 259 stamps in operation.

MEXICO.

At Cucube, Sonora, Bonney & Kearney are developing a property and erecting a mill of forty tons daily capacity.

Cranz Bros. have bought a group of mines near Alamos upon which they are doing extensive development work and building a ten-stamp mill.

A shipment of ore from the Bufer mine, near La Dura, went \$400 per ton, and netted \$1127.—The Reina mine near Cusihuiriachic has 400 miners at work. Last year it produced

\$500,000 silver and has an equal amount in ore on the dump.—The Santa Elena, in the same district, ships from forty to seventy-five cars of ore daily.

The gold, silver and copper coined by Mexico the last seventeen years averages about \$26,000,000 a year.

The Esperanza Co., a Kansas City corporation with a capital of \$600,000, will open extensive placer grounds near Jopacari, Sonora. Alamos, Sonora, is shipping from \$10,000 to \$15,000 worth of gold bullion monthly, and the 10-stamp mill of the company is to be doubled in capacity. The New York & Sonora M. Co. will put up a smelter and build a railroad to its mines at Las Cruces.—Barnes & Furman of London have taken a bond on the San Pablo mine near Chihuahua for \$30,000.—G. J. Rieger bought Las Coches mine near Geoblan, Sonora. He will put in hoisting and pumping machinery, and work the property on a large scale.

Charles W. Kindrick, United States Consul at Juarez, reports to the State Department regarding the Juarez Concentrating and Smelting Works, as follows: "The Juarez Co., organized under the laws of the State of New York, started with a cash capital of \$100,000 and ample banking facilities to handle all raw material it might purchase. The officers of the company are: President and Gen. Mgr., Britton Davis of El Paso, Tex.; vice-president, C. B. Agnew, New York; directors, J. T. Terry, E. D. Morgan, Jr., A. G. Agnew, and S. J. Tilghman, all of New York, and Max Weber of El Paso, Tex. The products of the plant will be marketed partly in the United States and partly in Europe. I was informed by the Gen. Mgr. that the works were located on the Mexican, instead of the American side of the Rio Grande river, in order to avoid the payment of a very high duty on the lead contained in the crude ore or raw material as brought from the mines, and to facilitate its reduction into metallurgical shape before subjecting it to the increased cost of transportation to the final reduction works in the United States. The concentrator will have a daily capacity of 200 tons, which can be increased at any time by 50 per cent. The sampling works in connection with the concentrator will be able to handle 500 tons of ore per day. Mr. Davis says that two 100-ton smelting furnaces will be added to the plant in a short time, one for silver and lead and the other for copper. It is the intention of the Juarez Co. to make this plant, in the course of a few years, the largest in Mexico. The managers believe the mineral resources of the States of Chihuahua and Sonora will justify them in increasing the capacity of their plant from time to time."

The official report of the Batopilas mine, Alexander Shepherd's bonanza property, for the year 1896-7, shows that the total workings for these years was 23,700 feet, and ore to the amount of 43,807,612 pounds was taken out, valued at \$907,626 (Mex.) of which \$690,595 was in silver bars. The expenses were \$1,360,521, showing a deficit of \$452,896. The debt of the company is \$681,347 (Mex.) and \$389,997 gold, unfunded, and 6 per cent bonds for \$454,700. The Porfirio Diaz tunnel is now in 6069 feet, and advancing at the rate of 100 feet a month. In 550 feet more it will cut the Todos Santos vein and the Roncesvalles 360 feet farther on, which will reduce the cost of working these veins. The company is now doing its own casting at a great saving of expense, and proposes to increase its milling facilities.

CUBA.

The iron mining enterprise in the Santiago country is getting considerable advertising these days. The Spanish-American Iron Co. has headquarters at Philadelphia. C. R. Rand is president. The company was formed eight years ago and has about \$3,000,000 invested. The steel pier was built in 1894. The area of the country operated is 2500 acres. Before the war 300,000 tons of iron ore were annually shipped to American, English and German ports. Several furnaces and steel companies on the south Atlantic coast were largely or wholly dependent upon the company, and the war has cut off their supply.

SOUTH AFRICA.

The gold output of the Rand increased during May nearly 50 per cent over 1897. Thus far in 1898 this South African gold product has aggregated 1,616,900 ounces, against 1,136,900 in the same five months of 1897 and 860,800 in 1896.

Recent California Mining Incorporations.

California Dredging Co., San Francisco; capital stock, \$25,000; subscribed, \$18,088; W. E. Palmer, F. S. Mayhew, W. M. Klink, L. J. Holton, F. B. Peterson, S. W. Cheyney, J. M. Goodman.

The Nashville G. M. D. Co., Sutter Creek; capital stock, \$1,150,000; subscribed, \$150,000; C. P. Eells, E. C. Voorhees, J. Ross, J. S. Parkes, C. W. Howard.

Slap Jack M. Co., San Jose; capital stock, \$300,000; subscribed, \$225,000; F. F. Britton, F. L. Argall, B. Griswold, H. Argall, E. L. Emerson.

Sizes M. Co., Lakeport; capital stock, \$100,000; subscribed, \$85,000; W. P. Butler, C. M. Hammond, W. O. Edmonds, R. S. Rodman, A. B. Rodman.

El Promontorio M. Co., San Francisco; capital stock \$700,000, subscribed \$250,000; G. H. Kavanagh, E. A. Engelberg, A. A. Brown, W. Hasenberg, C. Boone.

Climax G. M. Co., San Francisco; R. B. Teedy, D. McCormick, F. B. Burnett, R. H. Warfield, H. Francis, V. Neale, J. W. Pew, C. S. Benedict, H. N. Williams; capital stock \$200,000, subscribed \$4500.

Bay State and Alaska M. Co., San Francisco; capital stock \$5000, subscribed \$4000; L. B. Terrell, H. O. Rogers of Boston, H. C. Burdick, T. Mackiernan, R. G. McConnell of San Francisco.

Coast Industrial Notes.

—Tickets are being sold from San Francisco to Chicago, via Portland, for \$28 net.

—Columbia river canners expect to put up 500,000 cases (forty-eight 1-lb. tins) salmon this year.

—At Ontario, Oregon, \$4000 worth of wool has been shipped daily since sheep shearing begun.

—It is announced that the salaries of engineers and firemen on the Northern Pacific Railroad are advanced 15 per cent.

—The auditing department of the Southern Pacific Company has issued the financial report of the fiscal year. It shows an increase of \$4,000,000 in the profit of last year.

—San Francisco shows an increased assessment of \$3,839,264 on personal property and real estate in '98, the assessment of last year being \$347,954,830 against \$351,734,094 for the present year.

—The past year the Highland, Cal., Fruit Growers' Association has handled 70,743 boxes of oranges and 12,016 boxes of lemons. The cost of packing the oranges was \$29,016; of the lemons, \$4996.

—Churchill Bros. at Summerland, Cal., have contracted to deliver to H. T. Oxnard 450 barrels of oil per month for five years at 90 cents a barrel, to be used for fuel at the beet sugar factory at Oxnard.

—At Pasadena, Cal., oil is used for fuel in burning brick. This is said to be one of four brick factories in the United States that have successfully adopted this fuel. The Pasadena factory consumes sixty barrels daily.

—The Philippine Islands has but one railway, from Manila to Dagupan, 123 miles. This railway has a single track of steel rails, is well built, and the bridges along the route are of iron or stone of excellent construction.

—During the eleven months ending June 30, '98, the United States mint in San Francisco has coined in gold \$48,931,000, and in silver \$4,889,441, a total of \$53,820,441. This is the largest year's coinage in the history of the mint.

—The Western Sugar Refinery of San Francisco has closed a contract with producers at Coalinga, Cal., for 700 barrels of oil a day for two years. All the furnaces at the Spreckels sugar factories are being changed from coal to oil burners.

—A company has been formed for the cultivation of ginger, which grows wild in the States of Guerrero, Puebla and Chiapas, Mexico. An acre will produce 4000 pounds of the root at a cost of 2 or 3 cents a pound put at the seaport, and it is worth 20 cents in New York.

—Two trainloads of cattle are shipped daily from Ontario, Oregon. It is estimated that 400 trainloads are contracted for shipment, representing 12,000 carloads (192,000 head), worth on the range \$4,000,000. Most of the stock comes from Harney and Malheur counties.

—J. P. Morgan & Co. are the purchasers of the Spokane and Northern Railroad property, presumably for the Northern Pacific. It is believed the roads will be operated jointly by the Northern Pacific and Great Northern. The price paid for the property is said to be \$5,000,000.

—After Senator White and other obstructionists had spoken their pieces, the U. S. Senate last Wednesday, by a vote of 42 to 21—2 to 1—passed the resolution annexing the Hawaiian Islands. It had already passed the House. The President signed the bill on the 7th, and the Island Kingdom is a part of the United States. The Philippines come next.

—It is again asserted, this time in the Los Angeles, Cal., Review, that the California Eastern railroad is to be extended from Manvel, San Bernardino county, to Goode Spring, Nevada, a distance of seventy miles. It is said that the Campbells of Salt Lake, who own valuable lead mines at Goode Springs, have guaranteed an average freight of 300 tons of lead ore per week.

—A meeting of the Auditing Board to the Commissioner of Public Works was held in Sacramento last Wednesday. The board arranged for the use of stone in the place of sand on a portion of the contemplated work on the Newtown Shoals upon recommendation of the Government engineers. Work on the Newtown Shoals will be commenced as soon as possible. The work on the cut-outs on the San Joaquin river is progressing.

—The big timber raft that left Astoria, Or., June 24 in tow of the tugs Rescue and Monarch broke in two somewhere in latitude 42 north, longitude 123.40 west. The Monarch brought in 2250 M. feet of lumber; the Rescue is towing about 2000 M. feet, and a million feet was lost. The raft was built on the Columbia river by Inman, Paulson & Co. for the D. H. Bibb Lumber Co. and was originally 376 feet long, 43 feet broad and 47 feet deep. It was bolted together by 110 bolts, 27 feet apart.

—The Boston News Bureau says: "On the Pacific coast one finds a sentiment which must be met with to be appreciated. It will be recalled that the Pacific States were warmest for war with Spain. Now one finds the Klondike excitement superseded by the 'On to China' sentiment. Californians declare that in the next century the great trade with the world will be upon the Pacific ocean rather than upon the Atlantic. They say that Africa and South America and the undevel-

oped portion of North America hold forth no such trade incentives as can be had in China, where more than 300,000,000 of people have a civilization thousands of years older than our own, are possessed of art and letters, manners and habiliments, and need only American machinery and American organization to make across the Pacific the greatest interchange of trade that has ever taken place between nations, continents or civilizations."

—Coast benefits conferred through the completion of the Nicaragua Canal under American control are great. It will bring the ports of Europe 7000 miles nearer and reduce the distance by water to New York 10,000 miles, thus solving the transportation problem. It will save \$2,000,000 annually in the handling of the cereal crop and other products of California. In a military point of view, it will duplicate the effective value of the United States navy, as exemplified by the recent remarkable trip of the Oregon around Cape Horn. As a business investment, it would pay 8 per cent yearly on \$100,000,000. The Suez Canal cost \$87,500,000 and yields a net annual profit of nearly \$9,000,000, besides an increase of 300 per cent in the par value of its shares.

—J. F. Flynn of Durango, Mexico, tells Iron and Steel that the greatest development in silver-lead mining has taken place in the States of Nuevo Leon, Coahuila, Chihuahua and Durango. Monterey has shown the greatest increase in production. Large bodies of silver-lead fluxing ore have been discovered there and the production has increased from about 1000 tons per annum ten years ago to over 100,000 tons per annum at the present time. The silver output in the State of Durango is increasing. Gold and copper mines are also developing. The Avino mines in that State have been sold to a wealthy London syndicate and several American companies have made purchases of good mines in the same district. Extensive reduction works will be erected immediately at Avino. At present the States of Guerrero and Michoacan are attracting the attention of mining men. The Inguaran copper mines have been acquired by the Rothschilds for \$5,500,000. A railroad 150 miles long will be constructed from the coast of Sihuataje to the mines and a reduction works of 2500 tons daily capacity established. There are now two railroads leading for the district, one to be built by the Rothschilds, which will run from the coast to the mines, and another by the Mexico Cuernavaca & Pacific, which already has about 300 kilometers constructed and will run from the City of Mexico to the Pacific. The last-named road, besides tapping this mineral district, will pass through an agricultural country in the Balsas river valley. The Government is interested in the construction of this road and is giving Col. Hampton, the president of the road, every assistance to enable him to complete it. This will give Mexico two transcontinental lines and will open for development two of her richest States. There has been no material increase in the price of labor nor in the prices of articles of prime necessity. For this reason the cost of producing all articles is about the same as when silver was higher, while on the other hand the silver value of all articles produced for export has increased about 40 per cent. This is the cause of the activity in gold, copper and lead mining, and in the cultivation of tobacco, coffee, vanilla, cacao and all other articles of export.

Commercial Paragraphs.

M. P. Ross of San Francisco is building a gold mill at Guanajuato, Mexico, with a daily capacity of 300 tons. The Union Iron Works is furnishing the machinery.

C. B. Boothe & Co., of Los Angeles, Cal., here recently installed for Colton Terrace Water Company of Colton, San Bernardino county, a pneumatic lift pumping plant using as motive power a 20 H. P. single-phase A. C. motor. The same firm has put in another of these motors of the same size for the Cucamonga Water Company, North Ontario. The Covina Water Company, Lordsburg, Los Angeles county, have their steam-actuated pneumatic lift plant in satisfactory operation. Its installation was superintended by Mr. W. A. Wood, foreman of construction for C. B. Boothe & Co. and is designed to pump from ten deep wells.

This season the San Francisco Launch Co. has built for the Yukon trade, the Mary Ellen Galvin, 200x40, drawing 18 inches loaded, and on that draft carrying 400 passengers and freight; the City of Dawson, a stern-wheeler, 125x38, 22-inch draft; a Government cutter, speed sixteen miles, 180x36 feet, draught 16 inches; the steamer Florence, schooner rigged, 125x22, now on the Yukon; the steamers May D., City of Redlands, Edith McKyle, each about 65x16, all stern wheelers. The Launch Co. also built 132 metallic life boats, yawls, etc., during the year, a 27-foot yacht, besides tug boats and launches.

The directors of the General Electric Company at a recent meeting voted to recommend to the stockholders a reduction in the share capital of the company, both common and preferred, of 40 per cent, so that each holder of 100 shares of present stock will get sixty shares of the new stock. This settlement, while satisfactory to the common stockholders, is regarded as particularly favorable to the preferred shareholders, inasmuch as it will render unnecessary the taking of any steps for the liquidation of the company, in

which even the preferred stockholders would receive only the same amount as the common stockholders, and no back dividends. The plan now adopted contemplates the payment, from the surplus earnings of the company as they are hereafter made, of the accrued dividends on the preferred stock. On the basis of the new capitalization \$1,275,000 will be required annually to pay 7 per cent upon the preferred stock and 6 per cent upon the common stock. Stockholders meeting Aug. 10th, '98, at noon, at Schenectady, New York.

The Denver Engineering Works, Denver, Colo., have orders for two complete concentrating mills, two 10-stamp mills, seventeen of their new concentrating tables, one 110 H. P. geared steam hoist, two 20 H. P. and one 50 H. P. power electric hoists, four 80 H. P. horizontal tubular boilers and other apparatus. They are now constructing eight of their new automatic high speed engines. Three are to be installed in the Daniels & Fisher building, where they are to be used in driving the Siemens & Halske electric lighting generators; two are for a large silver mine in Mexico, and three will be installed in Denver.

Personal.

J. T. KEEGAN becomes Supt. Sweet mines, Basin, Idaho.

CHAS. BUTTERS was at Kennett, Shasta Co., Cal., this week.

GEO. BLAKE, Supt. Bell mine, Tuttle town, Cal., is in San Francisco.

F. P. BONNELL, Supt. Flint mines, De Lamar, Idaho, is in Denver.

C. JOHNSON, Mgr. Mt. Gaines mine, Hornitos, Cal., is in San Francisco.

M. B. HARRIMAN, a mine owner from Sonora, Cal., is in San Francisco.

O. L. BARTON, Supt. Herman mine, Westville, Cal., is in San Francisco.

A. B. McDONALD, Supt. Kanaka mine, Groveland, Cal., is in San Francisco.

WALLACE MACGREGOR is in present charge of a cyanide plant at Johnsville, Cal.

W. MAITLAND, Supt. Nash mine, Abrams, Cal., has returned from San Francisco.

D. W. DEITRICK, Butte, Mont., is examining the Frazier copper property near Taos, N. M.

J. S. KENNEDY, Supt. Campodonico mine, Hornitos, Cal., has returned from San Francisco.

F. W. WILMANS, Supt. Bonanza mine, Sonora, Cal., has returned home from San Francisco.

J. ROSS, JR., Supt. Wildman-Mahoney mine, Sutter Creek, Cal., has returned from San Francisco.

JNO. DERN, Mgr. Mercur mine, Mercur, Utah, has returned from Fremont, Neb., to Salt Lake City.

JOS. MCGILLIVRAY and F. T. PETERSON, formerly of Grass Valley, started to Dawson on the 6th inst. by steamer Brunswick.

HENRY BRATNOBER of the London Exploration Company is examining copper properties between the White and Copper rivers in Alaska.

T. KERNS and D. KIETH are in Lake City, Colo., examining the concentrating mill on the Hidden Treasure mine with a view to introducing the process at their Silver King mine at Park City.

A. RAHT, a Colorado metallurgist, has been engaged for six months by the Exploration Co. of Australia to work on the problem of treating the Central Broken Hill mine zinc ores. The company has given up the Ashcroft process.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING JUNE 28, 1898.

606,496.—BICYCLE BRAKE—J. L. Allen, Mendocino, Cal.

606,418.—ARRYING APPARATUS—J. Anderson, Walla Walla, Wash.

606,452.—GUN SIGHT—S. E. Fischer, Haywards, Cal.

606,215.—LACE HOLDER—W. O. Hill, Spokane, Wash.

606,581.—WAVE MOTOR—J. H. Leonard, Leonard Station, Cal.

606,578.—BICYCLE SUPPORT—P. Person, Stockton, Cal.

606,237.—LOCOMOTIVE—G. W. Prescott, Highland, Cal.

606,238.—HYDROCARBON BURNER—G. W. Prescott, Highland, Cal.

606,239.—COAL BURNER—G. W. Prescott, Highland, Cal.

606,593.—CAMERA—H. Stender, Prospect Park, Cal.

606,594.—CAMERA—H. Stender, Prospect Park, Cal.

606,432.—IGNITER—A. J. Tackle, Oakland, Cal.

606,493.—PISTOL—W. H. Trippett, Redlands, Cal.

606,261.—ENVELOPE OPENER—W. Yates, Richmond, Wash.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

A REVOLUTION IN FREIGHTING.

THESE WAGONS ARE ESPECIALLY ADAPTED FOR STEAM FREIGHTING; CAPACITY OF TRAIN 50 TONS.

"The Daniel Best" 50-Horse Power Traction Engine.

The most powerful and only Successful and Practicable Road Engine in the World. Over sixty of them in use in this State, and they are being Successfully and Profitably Employed in Hauling Logs Lumber, Ore, Salt, Borax and other kinds of freight. The work is being done **FIFTY PER CENT** Cheaper than it is possible to do with Animal Power. They can be operated over any ordinary road where it is practicable to use mules or horses, doing the same work. They can ascend or descend grades as much as 20 to 30 inches to the rod, hauling their loads of 35 to 40 tons, depending upon the condition of the roads; loads may be increased to even greater amount on moderately level roads. Send for descriptive Circulars and price List of Wagons and Engine. We solicit correspondence. No trouble to answer questions. Estimates made for complete Steam Freighting Outfits. Address

THE BEST MANUFACTURING CO., SAN LEANDRO, CAL., U. S. A.

THE COLORADO IRON WORKS CO., DENVER, COLO.

Established 1860. ENGINEERS AND MANUFACTURERS OF Ore Milling and Smelting Equipments.

We beg to call attention to our

High Speed Special Rolls

as being the most efficient and the most economical machine for fine dry crushing ever placed upon the market. The rolls having

NARROW FACES and LARGE DIAMETERS

can be fed evenly over the whole width of faces with certainty, and hence the faces or crushing surfaces are easily kept true. Descriptive pamphlet on application.

HIGH SPEED SPECIAL ROLLS, WITHOUT HOUSING.

Double rope tramways are acknowledged to be superior to those of the single rope type, and any one contemplating the erection of a tramway should investigate the merits of the . . .

THE ONLY AUTOMATIC TRAMWAY BUILT.

FINLAYSON PATENT AUTOMATIC WIRE ROPE TRAMWAY.

In this system the cost of transportation is brought below any figure heretofore reached. Its tonnage capacity is unsurpassed. Further information on application.

GEO. W. BARNHART, No. 4 Sutter Street, San Francisco, Cal.

The Pelton Water Wheel Company

Gives exclusive attention to the development and utilization of water powers by the most modern, economic and improved methods.

An experience of more than fifteen years, involving both the theory and practice of hydraulic engineering as relates to power development in its widest range of application, is at the service of its customers.

**Nine Thousand
Wheels**

Now Running,

Aggregating some 700,000 H. P.

ELECTRIC POWER TRANSMISSION.

Pelton wheels afford the most reliable and efficient power for such service and are running the majority of stations of this character in the United States, as well as most foreign countries.

Highest efficiency and absolute regulation guaranteed under the most extreme variations of load.

The Pelton Water Wheel Company,

121 AND 123 MAIN STREET, SAN FRANCISCO, CAL.

TUTTHILL WATER WHEEL.

The Best Jet Wheel in the Market,
BARRING NONE.

Wheels, Buckets and Nozzles Designed to Suit Special Requirements. When Head and Conditions Are Given, Theoretically as Well as Practically Perfect. Highest Efficiency Guaranteed.

We have a Sensitive, Simple Governor that will positively regulate speed of wheel. Specially adapted for electric railway and lighting plants.

MINING MACHINERY.

Be Sure You Get
THE GENUINE FRUE
VANNER.

SUPERIOR TO ALL IMITATIONS.

You do not know what is best in
CRUSHERS unless you have used our

Comet & Adjustable.

It is easily in advance of other gyratories, which lack its range of adjustment for wear and change in size of product. Our new heavy design is also superior in proportions to that of any competing machine. Its good qualities are evidenced by largely increased sales and expressions of satisfaction from customers.

All patent claims by other parties affecting the Comet Crusher have been put to rest by the final decision of the highest courts.

000000

FRASER & CHALMERS, General Agents for
Improved GREEN Blowers.

See those wires -- how they interlock? Note the smooth surface also.
No displacement of wires in any event. Gives three times the service of other cables, and adds correspondingly to the life of the rolling stock.

PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

DEWEY, STRONG & CO., Patent Solicitors, 330 Market St., San Francisco, Cal.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY, STRONG & CO., Patent Agents, 330 Market St., San Francisco, Cal.

Total from all sources, 1,436,730 tons.

Under date of the 1st, New York reports: "Financiers and leading business men here declare that the fiscal year which ended last night was one of the most prosperous in American history. It is impossible to get any approximately accurate estimate of the amount of money which is to be disbursed in the way of dividends and interest during the next week, but it is said with confidence that the sum is larger, both in the aggregate and in proportion to the capital which it represents, than in the record for any July 1, excepting, possibly, that of 1890 or 1891. But the most striking feature of the history of the fiscal year is found in the records, which show that foreign commerce is vastly in favor of the United States, and a financial condition which clinches the conviction of those who for a year or two have been persuaded that this country would before the end of the century be practically independent, financially, of any other nation. It is believed in financial centers here that, had it not been for the war, some attempt would have been made to invest American capital in other parts. In one sense some is being loaned to-day to Europe, for, in order to carry the credits or trade balances until a more convenient season for meeting these obligations, Europe is hypothecating exchange in the United States, or, in other words, discounting in our markets. It is believed that this satisfactory condition will continue in spite of the war."

In San Francisco, as elsewhere, the new war tax occasions considerable friction and annoyance. No one objects to paying whatever is determined to be legally required, but so far it is difficult to tell just what is requisite.

Mining Share Market.

SAN FRANCISCO, July 7, 1898.

Pending authoritative decision of the new war tax on stock sales, practically no business has been done by the Boards since June 30. Conflicting statements continue to be made. Commissioner Scott of the U. S. Treasury Department, Washington, D. C., writes:

Mining stock brokers and also persons doing a purely speculative business in mining stocks, strictly on their own account, doing no commission business whatever, are, in the opinion of this office, subject to the tax of 50¢, if, as it is understood, they are engaged in negotiating purchases or sales of stock "for themselves."

Mining companies which, as you state, are capitalized at from 1,000,000 to 2,500,000 and 3,000,000 shares of a par value of \$1 each, and whose stock is selling at from 50 cents to \$2 and \$3 per 1000 shares, are required to affix and cancel a 5-cent stamp to every certificate of this stock originally issued on or after July 1, 1898, even though its face value is but \$1.

On every transfer of a certificate of stock a broker delivering the certificate should affix thereto and cancel a 5-cent stamp, in accordance with the provisions of schedule A of the Act of June 13, 1898.

Richard Olney, ex-Attorney General and ex-Secretary of State, gives it as his opinion that the stamp tax on transfers of stocks applies only to corporations which may be formed after July 1st of this year, which is comforting.

Watson & Gibson of New York says: The opinion of the attorneys for the consolidated exchange is that a broker making a sale of 100 shares of stock in New York should affix a stamp of \$2 to the bill of sale which he delivers to the purchaser of the stock in question, but the selling broker is not required to put a 10-cent stamp on the notice to the customer who gave the selling order. An out of town broker who acts for a local customer does not need to put any stamp on the notice to him of execution of the order.

Regarding the 25 cents additional necessary if the certificate is transferred by the signing of the power of attorney on the back, officials of some of the Boston trust companies, acting as transfer agents, say that 25 cents is not necessary if the person in whose name the certificate is issued surrenders his certificate at the transfer agency and transfer the shares in person.

On the 5th inst., the executive committee of the San Francisco Stock and Exchange Board prepared and sent the following telegram to Senator Perkins at Washington:

Hon. George C. Perkins, Senate Chamber, Washington, D. C.—Under war revenue act business in San Francisco Stock and Exchange Board here is suspended until we can receive authoritative ruling on the following question: Clause 1 of schedule A imposes tax on sales of certificates of stock of 2 cents on each \$100 of face value, or fraction thereof. Does that mean on each \$100 of face value of the amount of the sale, or does it mean on each \$100 of the par value of certificates of stock? In dealings on the stock exchange here the distinction is vital, for in many instances sales of mining stocks could not carry the tax on the par value of the certificates. For example, on 1000 shares of Savage, sold at 1 cent per share, the value of sale would be \$10, and the tax at the rate of 2 cents per share on the face value of the certificate, which is \$100 per share, would be \$20, or twice the value of the thing sold. If the tax is on the par value of the certificates the tax is the same as on the sale of 100 shares of Chemical Bank stock and on 100 shares of low-priced mining stock, it is utterly destructive of the business of all mining exchanges west of the Mississippi. The intention was to impose a tax on the value of the sale in the same way and in the same amount, and substantially in the same language, as clause No. 2 imposes a similar tax on sales of products and merchandise in produce exchanges and boards of trade. This was also the construction given the former stamp law. Please obtain an immediate ruling from the Treasury Department and telegraph an answer at our expense.

San Francisco Stock and Exchange Board, A. G. Burnett President, F. W. Hadley Secretary.

To the above Senator Perkins to-day wired a reply that he visited the Commissioner of Internal Revenue, who decided that the tax of 2 cents is on each \$100 of the face value of the certificates, and that in this case face value means par value, so that a tax of \$2 must be paid on each 100 shares of stock whose par value is \$100 per share, until another ruling to the contrary is made, as of course it will be, as it was manifestly not the intent of Congress to tax anything out of existence. Meanwhile it is in order for the companies whose stock is dealt in to incorporate with capital stock shares from \$1 to \$5 per share, instead of \$100, as has been the rule. The days of "wash sales" are over.

The Huntington Mill is so well and favorably known among mining men throughout the world that any description of it would seem superfluous. They are in use in the United States; Canada, Mexico, Central and South America, Australia, China, Japan and South Africa—in fact, wherever mines exist, and have given the best satisfaction of all quartz-crushing mills. The construction of this Mill has lately been much improved and we claim it to be the cheapest, most efficient, simplest and most durable Mill upon the market. Catalogue upon application.

MINE BELL SIGNALS.

Adopted, Used and in Force in Accordance with State Law.

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN legal size, 12x26 inches the Mine Bell Signals and Rules provided for in the Voorhies Act,

passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and rules, printed on cloth so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 330 Market St., San Francisco.

California Bituminous Rock.

In the issue of June 25th, '98, appeared an interesting scientific article on California "bituminous rock." Bituminous sandstone in Santa Cruz Co. is among the important deposits of that character. The cuts on this page and page 56 give a good idea of how the bitumen is "mined." This Tertiary form of bitumen rock is usually in stratified deposits. Frequently fragments of marine vegetation and the bones of marine animals, together with shells, are found in these ledges miles from the sea.

These bituminous sand-rock ledges have been up-

fineness of the sand usually depends the compactness of the rock, and upon the structure of the sand and the toughness of the bitumen depends its durability. The rock composed of finely divided, sharp, siliceous sand containing from 10 to 17 per cent of tough, elastic bitumen, free from oil, is commercially considered the best. The mine illustrated herein is nine miles west of Santa Cruz, three miles from the ocean, at an altitude of 800 feet. The chief use of the manufactured product is in paving city streets.

The "Life" of a Mine.

The duration of the "life" of a gold lode mine, and

calculations, though entirely independent of it, comes an article in the *Sud Afrikanische Wochenschrift*, with the conclusions of which American miners will, probably, be more inclined to agree. In summing up, our antipodean contemporary says: "The life of a mine depends on the capacity of the mill. The more stamps erected the sooner the ore contents of a mine will be exhausted. In the first years of the Rand mining industry the mills had five, ten, or, at the utmost, twenty stamps. Then the conviction became general that a long life was an economic disadvantage to the mine, and that it was in the interest of the shareholders to produce the gold, and, through the

SANTA CRUZ, CAL., BITUMEN MINE NO. 1.—"MEDIUM" ROCK.

lifted to elevations varying from a few feet to nearly a thousand feet above sea level. Ledges of compressed silt, "chalk rock," frequently overlie the bituminous rock. After this waste cap has been removed, laborers bore holes from 10 to 16 feet in depth, which are sprung with dynamite and blasted with black powder, slicing down the ledge to its base or the quarry floor. It will be seen that only those ledges approximately horizontal and having a minimum waste cap can be worked to advantage, as, while deposits of bituminous rock are numerous, comparatively few can be economically worked.

Examined under a microscope, the rock is found to consist of finely divided sand, each particle of which has a perfect envelope of bitumen. Upon the

determination of its present value, are two things that have long been the subjects of efforts at correct solution by metallurgists and mining engineers. The most pretentious efforts in this direction that have come under present notice form the subject of an extensive monograph to hand by F. Hellman, a South African mining engineer, who gives the matter elaborate discussion. By a system of algebraic equations based upon yield of ore, cost of working, and amount "in sight," he figures out the approximate values of unknown quantities in the various cases proposed in an ingenious though not wholly satisfactory manner. As an example of an effort to solve the impossible, Mr. H.'s figures furnish at least commendable example of zeal, however one may differ from his conclusions. Simultaneously with the appearance of Mr. H.'s

gold, the profits as quickly as possible. This consideration was the cause of the remarkable increase of the stamps. But now these same people find it, in the interest of their deep levels, more convenient to reverse the arguments, and say that the big mills must be unfavorable to the value of the shares because they decrease the life of the mine." There are several factors entering into the problem that are apparently ignored in both the noted instances—among these are the method of working, the skill of the manager, desire for dividends or immediate profit, and other general considerations that will readily suggest themselves to our readers, assuming that by "the life of a mine" is meant how long its active working or development will result in even the smallest net profit.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Santa Cruz, Cal., Bitumen Mine No. 1—"Medium" Rock, 53. Santa Cruz, Cal., Bitumen Mine No. 2—"Soft" Rock, 56.
EDITORIAL.—California Bituminous Rock; The "Life" of a Mine, 53. The International Mining Congress, 54. Miscellaneous, 55.
MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 61-62.
THE MARKETS.—The Local Markets; Mining Share Market; Sales in San Francisco Stock Board, 74.
MISCELLANEOUS.—Concentrates, 55. The Cyanide Process, 56. Scroffication and Cupellation Without Muffle—A New Furnace and Method for Gold and Silver Assays, 57-58. Sizes of Wire Screens; Electrical Conductors near Powder Magazines; Russian Pipe Line for Oil Fields, 58. Coast Industrial Notes; Recently Declared Mining Dividends; Books Received; Catalogues, Etc.; Personal; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents; Recent California Mining Incorporations, 59. Methods for Preparing Proof Gold and Proof Silver; An Electric Brake; Different American Guns; Glass Enclosures; Antidote for Cyanide Poisoning; The Spanish Soldier a Frugal Liver; Changing the Form of Stone Under Pressure; Depreciation of Tools, 60. Commercial Paragraphs, 67.

THE war long since eclipsed the Klondike, and no amount of reference in newspaper columns to the great store of gold that is "going" to be brought out can renew the excitement of one year ago. Were a considerable amount of gold to arrive, it would attract attention; but newspaper prophecies are becoming ancient, and have ceased to interest. Nothing but the actual appearance of a heavy gold consignment from the Klondike will serve to occasion a recurrence of the acute Klondicitis so painfully resultant to many.

In the issue of the 13th ult. it was editorially suggested that the 25th anniversary of the completion of the first cable street railway in the world could with propriety be honored by the erection of a commemorative memorial in Portsmouth Square, San Francisco, the terminus of the old Clay St. line, and that in connection therewith could with equal propriety be placed fitting testimonial to the inventive genius of A. S. Hallidie, the inventor and first builder of that system of rapid transit. The 25th anniversary will be on the 1st prox. The Mechanics' Institute has petitioned the San Francisco city authorities for permission to erect such memorial, which petition will, doubtless, be promptly granted.

REFERENCE was recently made to casual comment on the "transitory" nature of mining, the point in reply being that mining partakes of the nature of permanency to the same extent of any other form of business, and that it is no uncommon thing to note the collapse and disappearance of old established and apparently prosperous businesses of every kind. A case in point occurred last week—the failure of the Boston Woven Hose and Rubber Co. Here was a long established, conservative, intelligently managed concern, paying dividends steadily for years at the rate of 8% per annum, and its stock above par—115. Yet it has been swept out of existence by some one of the many ground swells in the coming and going of commercial tides. This was a fair representative of "solid" business. Its owners and managers might possibly think mining unsafe and unreliable, a "transitory" proposition. Yet where in the history of mining is found instance where a mining corporation, paying regular dividends, its stock selling at \$115 on the \$100, and carefully managed and intelligently directed, collapsed in a similar way to this "solid" Boston concern? Failure is liable in any firm of legitimate business, mining, manufacturing or mercantile, in the former probably to a less aggregate percentage than in the latter two. As for permanence and continuity of mining, there are quartz and hydraulic gold mines in California that have been worked profitably and continuously for nearly forty years; recently the Eissenzecher Zug mine, near Siegen, Germany, celebrated the 400th anniversary of its continuous working; the Rio Tinto of Spain has yielded almost continuously for over 1000 years. The list might be extended indefinitely.

The International Mining Congress.

The second annual convention of the International Mining Congress closed its session at Salt Lake City, Utah, last Saturday. On the second day Louis Fade read a paper on "The Cyanide Process," which appears in full on page 56.

As heretofore stated, the proposed recommendation of new legislation elicited from the Committee on the Revision of Federal Mining Laws a majority and minority report.

W. B. Heyburn of Idaho favored the minority report. He opposed the proposition of the majority to abolish the apex law and to substitute in its place the "square" claim, giving the locator everything within and beneath his lines. He said he lived near British Columbia, where since 1891 the square claim has been the law. The people of British Columbia, he claimed, after an experience of laws based on the American laws, as well as of the square claim law, now desire to change back to the American system. He argued that a difficulty of location would arise after the adoption of the square claim law. "In order to make a location," he said, "the law requires first the discovery of mineral in place. The man who has the apex can do this without difficulty, but the next man will be required to sink a shaft until he taps the vein before he will be allowed to even make a location. If a poor man, he is simply barred. The square claim worked all right in British Columbia," he continued, "until the original locators and workers of the vein reached their end lines. Then they were compelled to stop, and a neighbor couldn't locate because he hadn't made a discovery."

Mr. Heyburn advocated the proposition of the minority report for the establishment of a base line: "The end lines of the first location made upon any ledge shall govern as to the direction of the end lines of all subsequent locations upon the same ledge."

He spoke of the expense to the prospector under the proposed law and declared that it would be so great that a man financially able to prospect would be so rich that there would be no necessity of his working. "It requires \$50 for a location," he added. "Now I know many locators who haven't had that amount in cash in five years who laid the foundations for the greatest camps in the world."

Mr. Heyburn concluded by urging that no recommendation be made to the national Congress to change a law that has stood the test of a quarter of a century during which it has been interpreted at a cost of millions of dollars.

In support of the majority report, W. S. Keyes of California said:

* * * * *

The first law, that of 1866, was not satisfactory, chiefly for the reason that it invited "jumping." The original locator was obliged physically to trace out any and all subsequent locators who, meanwhile, were robbing number one of the fruits of his discovery. If, for instance, the interloper were, say, several hundred or a thousand feet distant from the discovery it might take many months and much expense to demonstrate that the ore bodies were part and parcel of one and the same vein. Congress required six long years—viz: until 1872, to amend the law as it now reads. They succeeded in curing one defect, but fell into another nearly as bad. They gave the locator a right to follow the dip of his ledge at right angles to its course or strike, but now he is put into a straight-jacket in that he must follow his vein down into the crust of the earth within a space rigidly determined by his end lines. If, fortunately, the locator should have so laid his parallelogram that his end lines form an exact right angle with the course of his ledge, well and good—the coat fits—but if, unfortunately, after further development the vein happens to change its course and pass through one or both side lines, the vise-like grip of the law holds him to the conventional direction which he has selected and may even (as in the Flagstaff decision) cut him down to the mere width of his location and this, in certain districts, may be as small as 50 feet.

Our mining laws were originally made by miners who were not lawyers and by lawyers who were not miners. They built upon the foundation of the mining ordinances of old Spain, but the attempt to improve upon them has resulted in our present hodge-podge of chaotic confusion.

The old Spanish law, once universal in all Spain's colonial possessions, and now happily abandoned over the entire face of the earth with but two exceptions, gave a miner a certain amount of surface ground dependant on the angle of his dip. He was obliged to sink on his ledge ten varas, about 33 feet, which, when accomplished, entitled him to a certain amount of surface ground. The law provided that the commissioner, who marked off his ground by surface boundaries. The miner might follow on his dip, but could not go outside of his surface either on the strike or dip.

The new law—the law now in force in every Spanish speaking country, with one solitary exception, grants simply a surface varying in size from 100 meters by 100 meters, i. e., 328x328 feet in Mexico to 400 meters by 200 meters in most of the Central American States, i. e., 1312x768 feet. In the former case—an amount of land equivalent to nearly two and a half acres; and in the latter—equivalent to nearly twenty-two and three-quarters acres, which is a little more than our 1500x600-foot claims, which cover about twenty and three quarter acres.

All of these countries permit the locator to take as many locations as he chooses, but since the grant is contingent upon paying a cash royalty to the Government no locator takes more land than he actually needs to protect his dip.

It will be evident from the above statements that none of these countries permit the extralateral right and therefore have no need to take cognizance of its corollary, the apex. I look upon this extralateral permission of the law as the chief vice of our present mining code. It has caused more heartaches, more lawsuits and more money lost and property taken by the law than our British friends. I may give some few examples amongst the thousands which might readily be cited. On the authority of a former Surveyor-General of Nevada, Mr. S. H. Marlette, "there was expended in litigation on the Comstock lode during the years 1880-1885, inclusive, not less than \$9,000,000—one-fifth of the total product of the mines and considerably more than was declared in dividends during the same time."

Senator Stewart estimates the cost of litigation carried on by the Chollar and Potosi Mining Companies, prior to 1886, at \$1,300,000, and the expenses of the Ophir-Moscow war at somewhat less than \$800,000. The total costs of litigation in the Washoe district up to January 1st, 1886, he computes at \$10,000,000. As a part of the litigation there sprang up a horde of greedy, conscienceless "standing witnesses" ready, for pay, to swear to anything.

In this connection I may recall a conversation in my presence between a celebrated mining magnate, since deceased, and a man supposed to be familiar with all the facts in a contemplated mining litigation. Said mining magnate wished to learn something about the original location, amount of work, etc., etc., done upon a claim which he had bought or was about to buy, and to which there were several contending claimants. After diligent cross-examination the man was proved to be utterly stupid or absolutely ignorant as to the facts. Our mining magnate lost patience and began to reproach the man in rather rough language. After awhile the man himself lost patience and blurted out: "Just tell me what you want to prove, and I'll know it fast enough."

As an example of the evils of litigation due to the looseness of our earlier mining law, I may here interject a statement of Mr. Eliot Lord, as it appears on page 134 of the Fourth Monograph of the U. S. Geological Survey. The litigation on the Comstock, he says, "The cloud of uncertainty which rested on these claims grew blacker and heavier from month to month. Witnesses were manufactured by wholesale, and testimony to suit the requirements of the case was bought and sold with scarcely a pretense of secrecy."

On page 136, quoting from an address of Attorney-General R. M. Clarke, he says "Chicanery won more suits than eloquence and learning. A few years ago (1863) the practice of the law had, to some extent, degenerated into a mere art of victory."

Such a depth of infamy had been reached that even the ermine on the bench was soiled. I quote again from Mr. Lord, page 151: "The legitimate costs of this multitude of suits were enormous and the expenses of 'fighting fire with fire' were insupportable. The legal war culminated with the remarkable case of the Chollar vs. the Potosi M. Co. The suit was the immediate cause of the resignation of the honorable territorial bench and resulted in a contention without parallel in the history of the litigation of mining claims in its duration, fierceness and cost."

I quote from the speech of the Hon. Frank Tilford, delivered August 1, 1884: "A most potential cause of the present depression of mining is the deep and universal distrust of our judiciary. It is a sad, deplorable and notorious fact, that thousands and hundreds of thousands of dollars have been expended in obtaining corrupt decisions from infamous judges."

I quote further from Mr. Lord, on page 177. Speaking of the outcome of the Ophir-Burning Moscow litigation, he says: "To obtain possession of this section of the Comstock, 800 feet in length, nearly \$1,000,000 had been spent, but it was finally purchased by the Ophir Company at a cost of about \$70,000, while its market value at the time was only \$50,000. No further controversy is needed to disclose the folly of the laws which allowed a locator to follow the dips, spurs and angles of his ledge anywhere."

On page 77, he says: "The total number of suits instituted and defended by twelve of the principal companies of the Comstock, prior to 1887, was 245." Their cost, as heretofore stated, was over \$10,000,000. This vast sum was absolutely filched from the pockets of the owners of the mines, and would have sufficed for very respectable dividends in a certain very rich mine. All of this waste is justly chargeable to the mischievous "law of the apex."

On page 308, Mr. Lord says: "The most preposterous titles would be trumped up, as 'fighting' claims' so-called, and the discoverer of a bonanza might count himself fortunate if he recovered his original investment from the hungry mouths of contestants and lawyers."

"Jumping," perjury and crimes of violence were in the early days of our mining law as common as the locators and locators' agents were. Locations were often made by many ignorant and illiterate men, and even by men who had designedly sought to take advantage of "finds" made by more industrious prospectors who had preceded them? Even if the claim was originally properly located, then came the question of record. The District Recorder was not always honest, and, even if well intentioned, he was often careless. And, further, as I learn from what I believe to be competent testimony, the local land office in a certain very rich mine district, at some years ago deliberately set on fire in order to destroy the records."

I quote from the article of Dr. Raymond, "Mineral Industry," Vol. III, paragraphs on page 3, marked I and II. Also, paragraphs marked on page 4:

"Enough has been written concerning the curious, haphazard origin of our unique mining law, and the innumerable disputes which it has created. It is a law which is not only antiquated and out of date, but it is a law which is a constant source of trouble and expense to the mine owners, though, perhaps, all of this trouble will be reiterated again and again before they will be realized by all the parties whose co-operation is necessary to a radical reform."

"Enough has been written concerning the object lesson presented at this time by the mining districts of the world, including the greater part of the mining industry of the country, in which mining litigation is unknown, while in certain of our States and Territories such litigation is the result of the operation of the laws which give to mines and enriches only lawyers and experts. This lesson may also need to be enforced hereafter by repeated opposition; but only because of the slowness of the pupils who should have learned it long ago."

On page 712, Dr. Raymond writes: "The prospector is best rewarded by a grant of something definite which he can safely hold or easily sell, rather than of something so vague as to be forever uncertain."

On page 713, he says: "The actual expense of litigation under this law has mounted into millions. Is anybody silly enough to suppose that mines subject to such an extra risk can be sold as easily or at as high a price as if the purchaser was sure of getting what he thought he was getting, and sure of being protected in the rights thus definitely acquired?"

"It is plain to see that the all development of the mineral resources of the West will never come to pass until the capital it requires is better protected by definiteness in title and boundaries of mining property. And that cannot be done, in my judgment, by any amendment of the present law which shall leave it in the present abnormal, irregular, indefinite, precarious, and mischievous extralateral right."

"How many years longer will our Western fellow-citizens interested in mining continue to look upon the enormous investment of capital and labor in the development of the mining industry of the country, where mining rights are bounded by surface lines and vertical planes only and 'the law of the apex' is not known?"

"Let them take notice of the immunity from vexatious and ruinous conflicts over boundaries of mining rights enjoyed by placer mines and coal mines under their own eyes, and draw the obvious inference that a similar immunity conferred upon lode mines would be a boon to all concerned."

In view of Dr. Raymond's reference to the immunity from litigation in States where the "law of the apex" does not obtain, I may refer to the testimony of Mr. W. H. Stevens of Michigan and Colorado. I quote from page 307 of the Report of the Public Land Commission of 1880. Mr. Stevens said in relation to the status of mining laws in the States lying to the west and northwest of the Great Lakes:

"In Michigan only one case has been carried to the Supreme Court in the last twenty five years where the question of title to mining lands was raised. This was a contest between the Minnesota and National Mining Companies. The National Company held their title from a grant made by the State of Michigan under the provisions of the School Act. The Minnesota Company derived their title from the old law permitting location and pre-emption by authority of the War Department."

Hence the question at issue turned merely upon the decision of a conflict precipitated by two grants made respectively by the U. S. Government and by the State of Michigan. Such a or similar question might have, or, in fact, has, arisen as between claimants to agricultural lands. Our present mining statutes are a veritable Pandora's box of evils, a prolific source of woes intolerable to the legitimate mine worker. The crying defect is the "law of the apex"—the extralateral right." At the present time there are only three countries in the world which still maintain this absurd provision, which has been the cause of greater and more acrimonious litigation than all others combined. These countries are the United States of America, Bolivia, and Mashonaland in Africa—civilized, semi-civilized and barbarous.

There is no need to particularize as to the effect of this "right" as far as litigation in the first-named country is concerned, and as to the last I am not sufficiently informed. As to the second, however, I quote the testimony of Arthur F. Wendt, M.E., published in the "Trans. of the Am. Inst. of Min. Eng.," September, 1890, page 4. Speaking of certain mines near Potosi he says: "It is on record that in 1669 one Brigadier Montes, owner of the Guallabasi mine, lost a suit brought by Estevos, owner of the Flamencos mine. Montes had crossed from the Guallabasi to the Flamencos vein below the workings of Estevos, and claimed to be working another vein. The report says that 600 men were at that time at work extracting 150-junco ore for Montes. When the suit was decided against Montes he is said to have destroyed the mine. Be that as it may, neither the Flamencos nor the Guallabasi mine has been

worked for over a century, although both are claimed to be among the richest on the globe. It appears from this lawsuit that considerable depth had been attained by the mines of that period, and that the ridiculous law of following a vein, which then held good in all Spanish America and still obtains in the United States, was even then resulting in interminable legal controversies.

Now, assuming for the sake of the argument that our mining code is defective, let us seek for remedies. I can conceive of none other than an absolute wiping out of the extralateral right for all future locations and the substitution of the surface location; or if this seems too radical a departure, let us make it permissive as to all future locations, at the same time making provision that existing rights may not be lost unless the location itself be lost, and in that case to allow the nearest claim or claims to take the vacant ground—a practice which is in vogue in Mexico and works well.

Now, in order to put myself as to the mining customs of other civilized countries, I, as president of the Board of Trustees of the California State Mining Bureau, sent out an official request to the mining commissioners of every State in the world which pretends to keep a record of the production of its precious and useful metals and minerals. The responses were not prompt, although they were in the form of literature, and I was obliged to wait. I desired to learn their practice as to extent of location. I discovered that our neighbor to the north—British Columbia—originally adopted our own complicated and litigation-breeding extralateral right; but, after a long and painful trial, they, like good, hard-headed sensible men as they are, abolished the noxious thing. They found, as we find here today, neighbors and agents of litigation, investors were scared off, the poor men were unwilling to make locations. Now all is peace. Mines are at work and prospecting is vigorously prosecuted. Their unit of location is 1500x1500 feet, with no right of going outside of one's boundaries. The surface area is then a little over 51 acres. This is not too much for a serious mining venture nor, on the other hand, is it too little. In case the lode be vertical, this surface will include all of the dip as far as the lode is payable, and the vein will be found. If, however, the dip be as low as 45°, the locator would, of course, so lay his claim that his outcrop would be found at the point most distant from the direction of the dip, and this would give him 1500 feet perpendicular depth beneath the surface at the opposite side of his claim and about 190 feet in following the dip, which seems to be deep enough for ordinary deep levels. If, however, the miner be more ambitious, I have no objection to his claiming the entire dip in order to obtain all the advantages now theoretically granted under the present law; and further, I would forbid a second location on the line of the dip by any other claimant unless the first locator shall have declined the ground for a certain number of days or weeks, or shall have filed, with the proper authority, a written notice that he declines to locate when, of course, the ground would be open to any other person. If, however, the vein be in the center of a location with this dip (45°), the number of feet on the dip would be about 800 feet.

With the surface location, the miner knows he will escape the fangs of the "gentlemen of the black robe," and also of the expert witness. Next he knows what he owns and knows what he has for sale. Prospectors seldom or never develop their finds to any considerable extent. They do just enough work to give some idea of the value of the claim. A visitor to the mine, by taking along the surface location, can find out something definite—something tangible—and he knows his title is unassailable. If the surface be too small, he declines to buy until he shall have acquired land enough to warrant deep working. In this connection, I may mention a circumstance which occurred last spring in California. A representative of a strong foreign syndicate had found on the gold belt a property of which he approved; he stood ready to pay \$10,000 for the same. He had, however, his attorney investigate the paper title. This was found in order. He then made an examination of our mining laws, and, finding that we worked under our pernicious extralateral right, declared there was no certainty of title and declined the purchase.

I think no one will deny that the square or surface location will prevent ninety-nine out of a hundred of our litigation-will encourage investment and give us peace. It is bad enough to be obliged to take the usual mining chances, but when, in addition to this—to use the words of Chief Justice Beatty of California, long on the bench in Nevada—"we have the certainty of a lawsuit, provided the mine proves to be of any value, the outlook for the legitimate miner and the legitimate investor is far from encouraging."

From the standpoint of the prospector, who has nothing but his labor for his capital, I can conceive of no more so admirably known, further, that the all-powerful arm of the Government will protect him in his rights. He need not fear the combined wealth of the Rothschilds at the beck of neighboring claims. All he has to do is to honestly perform an amount of labor equivalent to \$100 per annum and he is safe. How has he fared in the past? Just recall the countless lawsuits from the days of Potosi to the existing Nevada. In one camp in one of these, I am, as I believe, credibly informed there are no less than thirty-seven suits now upon the docket. Can any system capable of such indebitness be considered as encouraging mining? Is it not a detriment both to locator and legitimate miner?

I have heard the square location attacked on the ground that it tends to a monopolization of the district. No! it does not. It does not do it the other nations of the earth use that system? Why do our fellow-citizens in the zinc and lead-bearing States to the east of us still cling to the dreadful monopoly-breeding system? I have no doubt there are quite a number of miners from these States here present who can inform us on this point. Why is it that so many men, both miners and others, testified before the Public Land Commission that they were in favor of a change in the laws, and that the vast majority of those who made answer were in favor of the square location?

Take this volume, "The Report of the Public Land Commission," and read almost anywhere, and since we are here in Utah and are the guests of the people of Utah, I read the testimony of witnesses from this State. Gen. Bane says, page 483: "I have been much impressed with the idea of making square locations." This would avoid litigation." Says Mr. Burgess, page 488: "I doubt very much if it is possible to retain in the mineral law any provisions by which locator would follow the dip of their claims outside their side lines without provoking litigation."

Mr. Noonan says, page 508: "I have been a miner fifteen or sixteen years. I think there ought to be a square location about 1500x1500 feet."

On page 512 Mr. Tiernan, Mr. Lynch, Mr. Colbath, Mr. Scott, Mr. Erb, etc., etc., twenty-nine in all, would make the unit of location 1000x1500 feet, without the extralateral right.

Again, on page 516, Messrs. Wilder, Bentley, Dickson, Bowers and Morton, all surveyors or engineers, agree to recommend 500x1000 and no extralateral right and no limit to the number to be taken.

And so we might go on, which is unnecessary, since it would be merely cumulative testimony. The great majority of witnesses who have ever been asked in a similar manner, and I would respectfully ask, Are all these people mistaken? Are they one and all monopolists?

In reading over the testimony of Mr. F. J. Wrinkle of Virginia City, Nevada, we find an opinion at variance with those of the proponents of the surface boundaries. Mr. Wrinkle is one of the best posted of all our mining men. He drew a most comprehensive map—namely, very much in the best of arguments against his own and in favor of the square location theory.

Intercalated between the pages 436 and 437 of the record appears this map, and by this very map—by the very lines he has drawn upon it—he himself shows that two parallel locations of 1500 feet each, and carried vertically downward, would include up to today every bonanza found in the Comstock and the big and the little, and the major portion of the deep ore body found underneath the Scorpio, a claim which commences nearly three-fifths of a mile to the east of the Union Consol idated outcrop.

If any further testimony be needed we can appeal to the attempt of Senator Stewart, the stalwart advocate of our present mining statutes upon the floor of the United States Senate. (From the work of Mr. Lord of the U. S. Survey, page 145.) Wm. M. Stewart proposed to end the Potosi-Chollar-Grass Valley litigation by defining the respective claims by surface boundaries.

He was convinced that the principal wealth of the Comstock would be found to the east, and although he did not disguise his opinions, he found few to agree with him. He formed a dashingly brilliant and sagacious plan, and he should be commended to the limits of the planes bounding their respective claims. All pending suits should be adjusted as soon as possible, and the main cause of litigation having been removed, he foresaw that the mining industry of the district would expand with natural vigor. Now,

this was substantially a relinquishment of the cherished but litigation-prone locator which followed the dip of his ledge indefinitely, and a substitution of the often derided Spanish or Mexican system of allotment; yet it was clearly the most expedient course to pursue.

The scheme, sound as it was, fell through, owing to the obstinate stupidity of a majority of the Chollar trustees.

That Senator Stewart was not the only advocate of surface locations, even on the Comstock, is proven by the testimony of Judge H. C. Whitman, given on October 11th, 1879, before the Government Land Commission. Judge Whitman was then the attorney of the great bonanza firm. They submitted to him the question of the "apex" or surface location, and he replied as follows (page 421 of the Report): "I think the square location, i. e., common law, would have no injurious effect upon deep mining. On the contrary, it would improve it, have a good effect, always provided that the United States survey and its monument. A man could then go in there feeling that he owned that piece of ground, and I think every prospector would be willing to avail himself of that and go to work on that supposition. The history, so far as I know, of every mine and mining company is continued litigation and expense by adverse locations. With a square location there could be no litigation. Mining men would be more willing to invest in a square location than they would in what we call ledge locations."

Heretofore it may be alleged that I have intimated that the members of the legal profession are not in sympathy with such an improvement in the law as will reduce litigation to a minimum. I have talked with many of them on this very subject, and to their honor be it said I have found but two attorneys who did not agree with me.

Students at the bar are as far as I have been able to learn, a unit on this question, and I am pleased to be able to repeat a few lines from one of them on this subject. I quote: "The methods provided for location and patent, to say nothing of the interminable confusion subsequent upon the recognition and attempted enforcement of extralateral rights, have involved mines and miners in a mass of litigation, the extent and expense of which is almost incredible. The present system should be repealed in toto."

The debate was also participated in by Chas. Mullen of Boise, Idaho; Thos. Smith, Tres Piedres, N. M.; H. E. Duncan, Oroville, Cal.; Prof. S. B. Christy, Berkeley, Cal.; L. Holbrook, Provo, Utah; Marks and Graves of Colorado, Morgan of Idaho, Read of Nevada and others. Upon the conclusion of the debate on the committee's report, C. E. Allen of Utah offered the following, which was unanimously adopted:

Resolved, That it is the sense of the International Mining Congress that the mineral laws of the United States should be so amended as to do away with the extralateral rights in mining claims.

Both majority and minority reports were virtually rejected in the forms presented.

There was not so much difference of opinion as to the necessity for a national Department of Mines and Mining. The following memorial to Congress as reported by the Committee on Resolutions was unanimously adopted:

WHEREAS, The mining interest produces the raw material which makes manufacture and commerce possible, and is the foundation of national prosperity; and,

WHEREAS, The miner makes a hand-to-hand fight with danger in depths of earth by which the whole country profits; and,

WHEREAS, In view of the difficulties and dangers which surround him and the fact that the scientific and executive aid which he needs can be understood and appreciated only by one who has shared his life and shared his difficulties, privations and dangers; and,

WHEREAS, The creation of the Department of Agriculture has already been of incalculable benefit to the agricultural industry, while the mining industry still languishes, a dependency of a department devoted to other interests and necessarily unable to understand and appreciate it needs; therefore, be it

Resolved, By the International Mining Congress, at Salt Lake assembled, that we do unanimously petition the Congress of the United States to create a new department, to be known as the Department of Mines and Mining, whose purpose shall be to aid, develop and foster the mining industry of the United States by every influence within its reach; and, further, be it

Resolved, That the president of this association is hereby directed to appoint such committees and take such action as shall bring this measure to the attention of every member of Congress and to stand firm in its support without compromise of any nature until favorable action has been secured.

A resolution by Delegate Frankenburg of Colorado was adopted recommending that the existing mining laws be so changed as to prevent the locator of a claim from amending his survey before the claim is patented.

Thomas Smith of New Mexico introduced a resolution, petitioning the United States Congress to restore to the public domain for entry the mineral portions of the confirmed land grants, which was not acted upon.

At the afternoon session a motion was adopted authorizing the president of the congress to appoint such committees as should be necessary to carry into effect the business transacted by the present session of the mining congress.

A resolution offered by Prof. Christy of the University of California was passed, recommending liberal increase in the appropriations for carrying on United States geological survey and the co-operation with surveys now carried on by the States independently.

The congress then adjourned to meet at Milwaukee Sept. 7, 1899.

There were present 230 delegates, representing Arizona, California, Colorado, Georgia, Idaho, Illinois, Indiana, Iowa, Kansas, Massachusetts, Michigan, Minnesota, Missouri, Montana, Nebraska, New York, Nevada, New Jersey, New Mexico, Oregon, Pennsylvania, Peru, S. A., South Dakota, Tennessee, Utah, Venezuela, S. A., Washington, Wisconsin and Wyoming.

Concentrates.

The Tritle mine at Big Bug, Ariz., has been sold for \$5000 cash.

The new camp of Republic, Wash., wants a custom mill built there.

H. ASHTON, an old-time prospector and mine owner, died June 29th at Prescott, Ariz.

The prospector and his interests were not lost sight of in the Salt Lake Mining Congress.

The coining presses at the Carson, Nevada, mint are being shipped to the Philadelphia mint.

The June shipments of quicksilver from the Napa county, Cal., mines aggregated 899 flasks.

It is expected that the Gila Valley, Globe and Northern Railroad will reach Globe, Ariz., Dec. 1.

The Bradford Co. of Philadelphia have bought the Comer & Sons mine at Big Bug, Ariz., for \$15,000.

The pipe line from the new compressor to the Noble Five mine in the Siocan, B. C., will be 800 feet long.

The consumption of cyanide on this coast is increasing. One mine, the De Lamar, at De Lamar, Nevada, uses 900 lbs. per day.

At the annual election of the Miners' Union, Grass Valley, Cal., F. R. Bawden was chosen president and E. F. Whiting secretary.

Owing to the recent great fire at Park City, Utah, the Silver King mine will distribute a supplemental \$2000 dividend this month.

A DRIFT MINE that is not a hydraulic mine is that of the Golden Shaft at Dutch Flat, Cal., the gravel being taken out a 100-foot shaft.

DE LAMAR, Nev., reports so many men volunteering for the war as to leave vacancies for hard-rock miners in the De Lamar mine and mill.

FROM Kodiak island, Alaska, this week came sixty sacks ore, thought sufficiently rich to warrant shipment to San Francisco for treatment.

CRIPPLE CREEK, Colo.'s gold output for June was \$1,303,925, the largest in its history. The yield for six months ending June 30th was \$7,500,000.

J. B. CROCKER, the representative of the Rockefeller interest at Everett, Washington, says the Everett & Monte Cristo railroad will not be rebuilt.

G. W. COPLEY, a mining man of prominence, died July 3rd in Spokane, Wash. He was interested in mining properties in the Cœur d'Alene country.

THERE are no present applications to the California Debris Commission to work hydraulic mines, nor will there be any likely till the fall rains set in.

The Congressional Committee on Mines and Mining reported unanimously the Barham bill, creating an executive department of mines and mining.

FOR the week ending July 7 there had been filed 479 certificates of location of mineral claims, nearly all on the south half of the Colville Indian reservation, Wash.

The Mining Congress at Salt Lake City last week declared in favor of the abolition of extralateral rights and the creation of a Cabinet Department of Mines and Mining.

The director of mint's report for fiscal year ending June 30th shows coinage of \$64,634,865 gold, \$16,485,584 silver and \$1,489,484 in minor coins; standard silver dollars coined, \$10,902,730.

The big \$3,000,000 deal for the purchase of the Le Roi, B. C., mine is off. The London directors grew tired of the wrangle and gave the contracting parties till July 12th to deliver the mine over or quit.

The new Government assay office at Seattle, Wash., begins business to-day. The gold that comes to San Francisco will be minted here; gold received at Seattle will be sent to the Philadelphia mint.

THE Nelson, B. C., Miner says that the men at the Hall Mines smelter at Nelson are protesting against a reduction in their wages from 25 to 20 cents per hour, and as a consequence the plant is shut down.

In every company of soldiers that has sailed from San Francisco to Manila is a large proportion of miners, prospectors and mining engineers, from the States of California, Colorado, Utah, Oregon, Idaho and Montana.

COLORADO SPRINGS, Colo., capitalists have expended \$100,000 trying to bore the Strickler tunnel through Pike's Peak. Last week a heavy flow of water caused work to cease, and indications point to an abandonment of the project.

The product of the Champion iron mine at Champion, Michigan, has been contracted for by a New York concern. The Champion is supplying solid slabs of magnetic iron ore, which are used to replace platinum as anodes in the collection of chlorine gas.

IN an effort to substitute Chinese for white labor on the Grizzly mine, near Summerville, Cal., a miners and citizens committee waited upon the authorities of the mine, in consequence of which the Chinese were all discharged and the white laborers reinstated.

AT a miners' drilling contest at Prescott, Arizona, July 4, Evans and McDougall of McCabe drilled 28 11-20 inches through granite in fifteen minutes, winning \$250 and two championship medals. In the single-hand contest J. Lebart drilled 16.1 inches, winning \$125 and a championship.

THE \$300,000 option on the Republic mine expired last Wednesday. Had the deal gone through, the Colville reservation, which was only opened for mineral exploration a little over two years ago, would have had the credit of producing a mine that commanded the biggest price of any in the State of Washington.

SANTIAGO DE CUBA which surrendered to U. S. troops last Thursday, the first part of Cuban territory lost by Spain in this war, is the region first conquered for Spain by the invading forces of Diego Velazquez in 1511. The existence of gold mines, after which the invaders were so eager, in the immediate neighborhood of Santiago gave it prominence three centuries ago.

THE "Spanish privateer standing on and off the Vancouver Island coast to intercept the Klondike gold fleet" reported in the daily press dispatches is a "fake," a mere figment of the imagination. It is probably inspired by the Canadian Pacific S. N. Co., to induce belief that "gold laden" vessels from the Klondike are probable, and to scare traffic into British bottoms. Such lies are more than ordinarily stupid.

The Cyanide Process.

Following is a paper read by Louis Fade before the International Mining Congress at Salt Lake City, Utah, July 7th, '98, and specially reported for the MINING AND SCIENTIFIC PRESS:

For every ore, so to say, a special process must be worked out, based on a scientific investigation of the material to be treated. One of the first questions to present itself is, Which gold ores can be successfully treated by the cyanide process? So-called coarse gold is not acted upon by cyanide, or, at least, only so very slowly that it is not practical to apply the cyanide process to ores which contain the gold in a coarse condition. Experiments and experience gained have shown that the precious metals can be successfully extracted by means of cyanide from low-grade gold ores, in which the gold occurs in a very finely divided free or metallic state, and I believe I am safe to state that, in nearly all gold-bearing ores, the gold exists in a free and not in a combined state. By this, however, I do not want to say that every low-grade ore in which the gold occurs in a very finely divided state can be treated by cyanide with success; but, with very few exceptions, ores of this nature can be treated. The selective action of a dilute cyanide solution on gold ores in preference to

ore, or if it belongs to the class of pyrites. The percentage of other metals, and in what combination they are present, should be known. Further, it is of the greatest importance to know the amounts of silica, alumina, magnesia, lime, etc.

According to the result of this analysis, it is for the metallurgist to decide whether it is advisable to subject the ore to a number of practical experiments or whether the ore is unfit to be treated by cyanide at all. If, in the metallurgist's opinion, it is worth while to make further experiments in order to become better acquainted with the nature of the ore, the first, and, in my opinion, the most important, question to decide is: Which is the most practical way for crushing the ore—that is to say, what crushing apparatus or machinery is the most favorable to use? To what size should the ore be best reduced for leaching purposes?

The question of dry or wet crushing has to be ventilated. The answer to this question depends altogether on the nature of the ore. On the one hand dry crushing is the proper way, and, on the other hand, it is detrimental and wet crushing preferable. On first thought, one is inclined to believe that the finer the ore is crushed, the better it is for leaching purposes; but this is very often a wrong conclusion. It may be all right for very hard siliceous ore, but not for an ore containing, for instance, alumina and mag-

extractions known, about 85 per cent of the assay value of the ore, is gained.

During my last stay on the Rand, in 1895 to 1896, I had the opportunity to convince myself that the classification and separation of the ores, according to size and specific gravity, before the treatment with cyanide, was a great success. On my visit to the Transvaal in 1893, three processes were in use to recover gold from ore: First, amalgamation over copper plates, by which most of the free milling gold was recovered (about 50 per cent of the assay value); second, subsequent chlorination of the concentrates from the Frue vanners; and, third, cyaniding of the remaining tailings. In 1897 the total output of the mines on the Rand amounted to over 3,000,000 fine ounces gold, of which one-third—say 1,000,000 ounces—was recovered by the cyanide process. That the amount of gold recovered by cyanide has increased so considerably during the last few years, and that the cyanide process has become quite a strong competitor to the chlorination process on the Rand, is mostly due, first, to the above-mentioned classification of the ore, and, second, to the so-called double treatment of the ore.

I thought it well to say a few words about these two processes, as in some cases they may be applied with advantage in this country. They may either help to increase the extraction or may lead to the

SANTA CRUZ, CAL., BITUMEN MINE NO. 2.—"SOFT" ROCK. (See page 53.)

the sulphides of base metals, with which they may be associated, is so wonderful that, from a chemical view, we may say that it is possible to extract the gold from all low-grade ores by means of cyanide, with the exception of ores containing copper, zinc and antimony combinations. In these cases the treatment becomes difficult, if not impossible. It is rather unfortunate that cyanide has this selective action, more or less, also on ores containing the above-mentioned metals. If this were not the case, we could say that this excellent process with which the names of Messrs. MacArthur and Forrest are so closely connected, and to which gentlemen the whole mining industry of the world is indebted for having first introduced the process, could from a chemical standpoint be applied successfully to all classes of low-grade gold ores.

In many cases in which the cyanide process proved to be a so-called failure, this failure was by no means due to the chemical action of the cyanide on the ores, but more to the preliminary treatment of the ore. Before beginning the experiments in order to prove whether an ore could be successfully treated by cyanide, it is absolutely necessary to become thoroughly acquainted with the nature of the ore as to its chemical qualities, as well as to its general structure. In every case a quantitative chemical analysis of the ore should be made, in order to find out if the ore is an oxidized (so-called free milling)

nesia, which are apt to form slimes when coming in contact with the cyanide solution, and these slimes render the ore impenetrable to any solution, and, therefore, make good extraction impossible.

To give a very good example in order to show how important this question of crushing the ore to its proper size for leaching purposes with cyanide solution is, I only need refer to what occurred some years ago at the now world-renowned Mercur mine, not many miles from here. At this time, six to seven years ago, the former managers of this mine and cyanide extraction plant—which, by the way, was the very first plant for treating ore in this country by the so-called direct (cyanide) process—were advised to grind the ore to the size of about 600 mesh in order to attain the highest possible extraction. The result was an extraction of only about 40 per cent of the assay value of the ore. This for some time proved quite a puzzle and was of great trouble to the managers. After many and not very successful experiments had been gone through, it was decided not to crush the ore so fine on account of the porous nature of the ore and its considerable percentage of talc and alumina, which latter, of course, rendered the ore rather impenetrable for the cyanide solution. The results were that the coarser the ore was crushed the higher the extraction became, and to-day, while the ore is crushed only to the size of $\frac{1}{4}$ inch square, one of the highest

successful treatment of ores which were not treatable before.

On the Rand it was proved that, first, a decided separation of the sandy ore from the slimes is necessary in order to obtain a good extraction; second, that by classification and concentrating ore into different groups, of different sizes and specific gravity, a much higher extraction is gained.

This separation and classification of the ore is done by passing the ore as it comes from the plates through a system of so-called Spitzlütten and Spitzkasten apparatuses well known to all of you, and which I therefore do not think necessary to describe in detail.

There is no more doubt that an ore crushed to as even a size as possible is much better leachable than an ore crushed in various sizes. Even a very finely powdered siliceous ore can be leached successfully if the size of the very small particles is more of an even size. Ores crushed to different sizes do not leach as well because the finer particles will always fill out the minimum spaces left between the coarser particles, and render it therefore much more difficult for the solution to penetrate and to come in contact with the gold-bearing particles of the ore.

On the Crown Reef mine—one of the best managed mines on the Rand—for instance, the ore is separated into two sizes and slimes by means of Spitzkasten after leaving the plates. Each size is col-

lected into a different leaching vat and treated for itself. The extractions are very good, as shown by the following figures:

In February, 1895, 16,056 tons of ore were treated; 59.721 per cent pure gold of the assay value of the ore was recovered over the plates; the first size made, being the coarser and more pyritic ore, amounted to 1057 tons. The residues of this size assayed 1.5 dwts. per ton after treatment by cyanide and the amount of this gold recovered was 7.578 per cent fine gold of the assay value of the ore. The second size made, being the finer and more sandy ore, amounted to 10,152 tons (residues assaying 0.87 dwt. per ton after treatment with cyanide). Fine gold recovered was 17.829 per cent of the assay value of the ore. Slimes amounted to 4847 tons, assaying 3.07 dwts. per ton. This gives a total actual extraction of 85.128 per cent on the assay value of the ore and a loss of 14.878 per cent, of which, however, 8.687 per cent was contained in the slimes, of which again about 85 per cent was recovered by a process worked out and introduced by Mr. Williams, so that there was an actual loss of only about 7 per cent of the fine gold contained in the ore, or about 1.5 dwt. per ton of ore.

Before referring now to the above so-called double treatment, I should like to quote a remark made by Mr. MacArthur at a meeting of the Society of Chemical Industry in 1890: "Elsner has stated that metallic gold dissolves in cyanide of potassium only in presence of oxygen. Not having seen the original account of Elsner's researches, I am not in the position to criticize his experiments; but I never could find that the presence of oxygen was necessary either to dissolve gold by itself or from ores by cyanide. If a piece of gold be immersed in a cyanide solution, so that air to act on it would have to penetrate two or three inches of the solution, the gold will dissolve in its usual slow and steady fashion. The equation shows that either oxygen must be absorbed or hydrogen evolved. I have seen no evidence of the former and can adduce no proof for the latter; but I think the latter the more probable, because I cannot conceive oxygen penetrating even a film of cyanide solution without at once oxidizing the cyanide to cyanate, whereas in the other case, as suggested to me by my friend Mr. Ellis, the nascent hydrogen may be at once seized by the excess of cyanide present and ammoniacal compounds formed. However, we do not concern ourselves much with the reactions of pure gold, but, as a matter of fact, we cannot find that oxygen plays any part in the cyanide extraction of gold from ores. We have treated an ore with cyanide with free access of air, and then a parallel experiment was done with boiled water, the bottle filled to the stopper with a solution of ore and the stopper sealed. The extraction was the same in both cases."

To-day no chemist is in doubt any more that Elsner's formula is correct and that the presence of oxygen is absolutely necessary for dissolving gold by cyanide. That this is so was proven by many experiments, of which I will mention one as very striking. Take two small pieces of filter paper, put equal parts of precipitated fine gold in powder form on each of them. Make up a very dilute solution of cyanide into two beakers. Take one of the filter papers with the gold on and put it in one of the beakers, but so that it floats on the surface of the solution only. Take the other filter paper with the gold on it and bring it into the second beaker, but so that it is covered by the solution at once. Allow it to settle to the bottom of the beaker, and, if it does not do this by its own gravity, assist with a glass rod. You will notice that the gold on the first filter paper will be dissolved in a few seconds on account of the cyanide solution coming in contact only from below, while the gold itself is exposed to the oxygen of the air. The gold on the second filter paper which lies at the bottom of the beaker, and which is perfectly covered by the solution, therefore not being able to come in direct contact with the oxygen of the air, requires hours before it becomes dissolved.

The practical confirmation of Elsner's theory has led to the so-called double treatment, which, in fact, is nothing but an oxidation process in which oxygen of the air takes the part of an oxidizing agent. To apply this double treatment, two leaching vats are placed above one another, so that the contents of the upper one can be easily discharged into the lower one by means of Butters' patented bottom discharge.

After the ore is charged into the upper vat, it is moistened with a dilute cyanide solution. After several hours, the ore is discharged into the lower vat. By doing so, the ore, moistened by the cyanide solution, cannot help coming in contact with the oxygen of the air. The practical result is that the first leaching, followed with a very weak cyanide solution in the second vat, holds by far the largest percentage of the gold contained in the ore. Practically, the formation of the double salt cyanide gold cyanide potassium had already taken place, and it requires only several washes with a weak solution to extract the yellow metal.

Free-milling, sandy tailings do not require a double treatment. The oxygen of the air brought into contact with the ore at the same time with the solution is sufficient in these cases.

Double treatment has been worked with very good

results on pyritic tailings, and I do not see why it should not work well with a low grade pyritic ore as well.

In cases in which the gold contained in the ore is not very readily acted upon by cyanide, a so-called artificial oxidation may be applied with success. Experiments have proven that an addition of oxidizing chemicals accelerates the solution of the gold considerably. There can be no doubt that the oxidizing qualities of, for instance, permanganate of potash, ferri-cyanide of potash, peroxide of sodium and other oxidizing chemicals, may be of great advantage in extracting gold from pyritous and refractory low grade ores. It is certainly worth while in cases in which refractory ore is not treatable with success to make experiments in this line under the direction of a good and competent metallurgist.

I have perfect confidence that the extraction of gold from ores by cyanide will increase in this country for a good many years to come, and that many low grade gold ore deposits, which were regarded as not payable heretofore, will become possible to be developed and worked successfully by the cyanide process, the process by which it became possible to increase the gold output of the whole world considerably, and is one of the reasons that the United States takes the lead to-day of all gold producing countries, which, let us hope, will be the case for many years to come.

Scorification and Cupellation Without Muffle ---A New Furnace and Method for Gold and Silver Assays.*

NUMBER II.

By GEORGE A. KOENIG, PH. D.

The Blast.—Experience has shown that the best effect will be reached when the air current at the nozzle balances a water column of 10 inches. The aperture of the nozzle is $\frac{1}{16}$ of an inch in diameter. The nozzle itself is made from pure nickel wire $\frac{1}{16}$ inch in diameter, the block being $\frac{1}{2}$ inch long; the $\frac{1}{16}$ -inch hole is drilled. This block is driven into the iron nozzle-pipe (8), Fig. 1, while the pipe is hot. The pipe (8) is either straight or curved with a radius of 10 inches. My first nozzles were made by simply hammering together the end of the iron pipe to one-half its diameter. This answers the purpose for a time. But gradually the oxidation proceeds, reducing the orifice at first, and ultimately making a wider hole, irregular in shape from the peeling or breaking off of the magnetic oxide. The nickel is so much less subject to oxidation than, from present appearances, a very long duration of the nickel-nozzle may be surmised. The air supply for one or two furnaces is best obtained from a Catalan water blast when the water rate is low. I had a Richards pump on hand, and set it up under a head of 120 feet of water. The supply was not sufficient for one nozzle. But since this instrument is primarily intended as a vacuum pump, and for that purpose is very good, its deficiency as a blast producer cannot be well laid against it. I replaced the suction nozzle with a No. 3 boiler injector, and obtained a supply for three nozzles at 10 inches water pressure. To do this a very considerable consumption of water is required. For a single furnace or two a pair of bellows will answer, but in this case the assayer needs an assistant to do the treading or pulling. The new assay laboratory of the Michigan College of Mines, which is just now being equipped, will have sixteen Koenig furnaces. The air will be supplied from a balanced air holder, into which it will be forced by means of a compressor. The power comes from a 2 H. P. gasoline engine, which will also drive the rock crusher, rolls, and sifting and mixing drums, necessary in preparing the assay samples. At the assay laboratories of mines and smelters there will be no difficulty, of course, as these works are furnished with air compressors.

Firing Up the Furnace.—The phenomena are just as in a Hoskins furnace. At first there is incomplete combustion and dissociation of the complex carbide molecules. The very disagreeable acetylene is one of the products. But since the furnace is supposed to stand under a hood, the temporary production of that compound, which should not exceed three minutes in duration, is of very little consequence. The acetylene formation is quantitatively stronger when the hot vapors strike a relatively cool surface.

Let the pressure upon the tank be low at the beginning, and if possible keep an extra Bunsen burner, placed right against the rear wall of the furnace under the burner. Such a burner can be rigged up easily even at a laboratory where gas is not used. An Erlmeyer flask is filled with 50 cc. of gasoline and loose cotton. The stopper has two perforations. Through one enters a tube to near the bottom, and this tube connects by a rubber tube with one of the blast nozzles. The other connects with the Bunsen burner. A very strong and steady flame can thus be produced and maintained for a longer time than it will be needed. If such a flame be allowed five minutes to heat the burner disk, and the gasoline valve be then opened slowly, it will be possible to get the jet to burn at the mouth of the

burner at once, instead of burning inside of the tube, and the combustion will be perfect at once, no dissociation product whatever appearing. It is not necessary to retire the burner mouth from the furnace at starting. In fact, I have two furnaces mounted back to back, with the four burners in rigid position upon the same pipe cross; but each burner is supplied with an auxiliary burner. Should the flame strike back into the tube after the furnace is once heated up, the remedy lies in shutting off the supply valve for an instant, and then opening it very quickly; the auxiliary flame, being partly sucked in at the base of the burner disk, will then come into play as a ready igniter. In fact, I leave this flame, properly reduced, burning as long as the furnace is going, because, as will appear hereafter, it is desirable often to shut down the heat supply completely for a longer or shorter period in order to maintain the most advantageous temperature within. It is just this point which constitutes the superiority of the furnace without muffle over the old muffle furnace. After roasting one set of assays, for instance, the furnace is at bright red heat. The fresh samples do not want more than dull cherry red. Therefore we cut off the gasoline, open the lid, and in five minutes the temperature will be down to the required point. The same thing occurs when, after one batch of crucibles has been taken out, the temperature is bright yellow. To set the cold crucibles into this heat results generally in cracking one or more crucibles. With this furnace such a risk need not be taken, as the temperature can so quickly be reduced. In cupelling, however, this feature is of paramount importance. I find that from fifteen to eighteen minutes are required to bring the cold furnace to yellow heat.

The Roasting Operation.—I find cast iron roasting dishes preferable to the fireclay ones. They are square or rectangular, with the corners well rounded to prevent lodging of material. I have them made of one, two and three assay tons' capacity. Their depth is from $\frac{1}{2}$ to $\frac{3}{4}$ of an inch. They are furnished with projections by which the tongs can get a good hold without touching the contents. There are covers provided for these dishes which prevent loss from the depreciation of the pyrite crystals and crystal fragments during the first period. During this period a slight caking occurs when FeS_2 changes to FeS . I leave the covers on until the blue flame around the further edge of the dish has disappeared. After the lid has been removed I pull out the tuyere plugs and induce a nearly horizontal air current by a proper position of the nozzles. The stop cocks being barely opened, the pressure at the nozzle is much reduced; the current can be made very gentle, and thus a fusion or semi-fusion of high sulphide ores can be easily avoided. Such a regulation is not possible in a muffle, because neither the heat supply nor the air supply can be regulated with any degree of nicety. The lid is the real thermostat. Its perfect balance in any position permits a play in depressing or raising the temperature as quick and unerring as the stop of an organ or the pedal of a piano. As the desulphurization progresses, the air current is increased and the temperature is raised first by lowering the lid, afterwards by turning on more gasoline, until finally the sulphates are destroyed at yellow heat.

The Crucible Fusion.—Each compartment will hold four Battersea F crucibles. With the diaphragm removed there is room for six, or twelve E, or four J, crucibles. The larger number of crucibles will melt down faster than the smaller number of equal size. This is owing to greater absorption in the first place, and increased radiation in the last stage when the high temperature is needed. Working in the usual way, with sodium carbonate as a flux, the operator has only to work the lid when the effervescence begins, in order to avoid overflowing of the contents. Watching through the observation hole, he will see the rising to the rim in one or more crucibles; and as they are all equally hot, or nearly so, the rising in one will be the rising in all. The opening of the lid fairly flings back the seething masses. Stirring is not needed in any ordinary case. The time is about the same as in a Hoskins furnace, always shorter than in a coke or charcoal wind furnace, but not very much shorter. I have lately experimented in the direction of discharging sodium and potassium carbonates as fluxes in crucible fusions. The success has been gratifying and warrants further effort with good promise. The results are not yet ready for publication, because the entire field is not covered. I will say at present only this, that I have put a charge of one ton of quartz ore, one ton of litharge and three tons of flux into an F crucible, having put it into the furnace at dull red heat, closed the lid, given full flame, and not looked at it for fifteen minutes. It was then found at quiet fusion. The condition of the crucible showed that the liquid had never risen beyond an inch below the rim. I gave it three more minutes; then poured, and found perfect fusion with easy liquidity, leaving no pellet of lead either in the crucible or in the slag. Every assayer will recognize the technical importance to himself of such a method of fluxing, which gives him an important quarter of an hour to weigh out a fresh lot of samples, or to attend to other necessary work, instead of blistering his face over an ordinary wind

*Atlantic City meeting of the American Institute of Mining Engineers, February, 1898.

furnace with a stirring rod, trying to keep the "blasted things" from running over—and often without success even at that, for whilst he stirs one crucible, the others will go over. The future flux will be nearly universal; the difference in the charges will be simply more or less, according to the acid or basic character of the ore. A few exceptional or extreme cases only will remain, in which other fluxing material will have to be added.

That I should have found the new furnace serviceable for lead assay work may be expected. The crucibles may either be set upon the bench or on the floor. It might be merely indicated here that I propose to investigate the old Clausthal method by alkaline flux and oxidation; for if its theory be correct, the blow-pipes will give the means for the decomposition of the sulpho-salts. I intend also to try cast iron crucibles instead of the unwieldy wrought iron ones; they would be much cheaper than the clay crucibles, but some experimentation will have to precede, in order to establish the proper mixture between white and gray pig.

The Scorification Assay.—I have reached now the special field of the new furnace and method. The accumulated experience of many generations of assayers leads to the conclusion that, everything else being equal, the assay for silver will come nearest the true amount when the melting down of the charge is brought about in the shortest time. My special experience with the new method brings affirmative evidence towards that doctrine. For in every instance the parallel assay has given a heavier button in the new furnace as compared with the muffle; and since I have found the loss in cupellation to be practically the same in both methods, I am forced to account for the higher result by attributing it to smaller loss in scorification, and here again to the more rapid melting down of the assay. This is, of course, only hypothesis. Perhaps the explanation lies partly in the shorter duration generally. My method in teaching assaying is to give the students half a dozen type mixtures, mixed up artificially with the greatest care, each sample containing exactly the same quantity of silver (300 ounces per ton), but in a different state of combination, such as chloride, nitrate, sulpharsenate, sulphide, sulphantimonide, mixed with quartz, pyrite, blende, galenite, chalcopryite, barite, fluorite, calcite, etc. The student puts these samples through until the buttons from each fairly tally. Then he acquires a real knowledge as to the limits of the method in the special and typical cases. He finds that the loss of silver is not at all the same, but that this loss can vary from 3 to 16 per cent with the best work possible. The very first assay is made with clean sand, the 30 mgr. of silver, wrapped in lead foil, being placed on top of the charge, sand and test-lead. This gives the minimum loss. During the last spring course the new furnace was first used by the students. There being only one in commission, each man could have it only for one day. A valuable number of data were, however, collected, aside from my own experiments; and upon these data I ventured the previous assertion that the average in all parallel muffle and non-muffle assays was higher in the latter. The first furnace was not mechanically as perfect as the later ones, and I look therefore with special interest toward the coming spring campaign. The fact, however, that the new laboratory will contain sixteen of these furnaces seems to give sufficient warrant that I do not bring this subject before the profession prematurely.

The following is a description of the process:

The furnace is at yellow heat; the bench and the bottom plate have been covered with fine ground brick (less than forty meshes), which I prefer to bone ash. The scorifiers have been placed upon the bench, so that each one stands centrally before a tuyere. The bench stands $\frac{1}{2}$ inch back from the tuyere wall; the rim of the scorifier touches the wall; the tuyeres and the observation holes are plugged. In three minutes from the closing down of the lid the charge is melted down, forming a steaming bath. Very refractory ores will show, at this stage, floating islands or peninsular formations (the ore charge being 0.1 A. T.). The tuyere plugs are removed, and the blast nozzles are brought into position, so that the jet will strike the circumference of the bath at an angle of about 35°. A very energetic reaction follows, so much so that the fuel supply has to be cut down about one-half. It will be nine to fifteen minutes before the bath disappears under the slag. The oxidation, of course, decreases in intensity as the bath becomes smaller, and the flame must be turned up, corresponding to this decrease. The blast nozzles are now withdrawn, the plugs inserted, and borax glass is added to the scorifiers, either wrapped in paper or preferably poured from a scorifier used as ladle, held with the tongs. Two minutes later the scorifiers are poured out in the well-known manner. Thus the scorifying process has occupied altogether, in the mean, seventeen minutes. The most refractory arsenides and antimonides are thoroughly decomposed in this time. I have not observed in any case the formation of matte or speiss, so common in ordinary muffle work. The A. T. of test lead has become reduced to a button of from ten to twelve grammes. With dry ores it is quite unnecessary to keep up the scorification until the bath is covered

with the slag. For such ones a duration of twelve minutes is quite sufficient and even desirable. For it is better to remove the lead on the cupel than in the scorifier; the chances of mechanical loss are less.

The Cupellation.—The cupels have been, in the meanwhile, thoroughly ignited, having been disposed on the furnace bottom between the bench and the back wall, and also piled up in the corners, during scorification. In the matter of cupels I have lately obtained what seems to be a decided improvement, though, to others, it may not appear in the same light, and this, perhaps, explains why the simple notion has not been adopted in practice long ago. The fact that boneash alone will not make a cohering cupel necessitates the employment of some cementing material, in the choice of which there is not much latitude. This suggests at once the idea of holding the boneash together in a metallic ring. In the English method of test cupellation this idea has long been made practical on a large scale. I do not know whether any assayer has tried to apply the iron ring to an ordinary cupel, and hence do not claim any special originality for giving the notion a trial. It may, perhaps, give to others the same satisfaction which it was given to me. The use of sugar or molasses solution I have discarded many years ago, for I consider the inherent viciousness of the practice almost criminal, from a scientific standpoint. We all know that carbon and lead oxide at red heat will either make carbon monoxide or carbon dioxide. We are most careful to ignite our cupels, so that no gases or vapors shall rise from them when once the work lead is upon them. Yet we put into the very interior of them this multitude of carbon particles, for, indeed, you must ignite a 1.5-inch cupel for many, many hours in an oxidizing atmosphere before the innermost carbon is oxidized. It has been my practice to mix the dry boneash with 1.5 per cent of dry pipe clay, then to moisten the mixture to the proper degree, and, in moulding, to cover the cupel mass with pure boneash. Whilst this makes a well-cohering cupel, it has the drawback of fissuring if not beaten to the exact point. The present practice is to cut a 1.5-inch gas pipe into lengths of 1 inch, to file or grind off the bur, and the containing ring is ready. Moisten the boneash very little, press it into the ring with the thumbs, even full, then set on the die, and drive it in even with the rim. One pound of boneash makes ten cupels. They can be used at once. They do not fissure, at least I have not yet observed a crack. No danger of breaking of the top rim with the tongs; no mishap has occurred to an assay office since I introduced them. At each service a film of black oxide or scale forms on the outside. When the saturated boneash is worked out this film cracks off alone. My experience is not long enough yet to say how many heats a ring will stand, probably between 50 and 100. The cost of the ring does not enter, therefore, as an item of appreciable expense. I find these cupels better absorbers than ordinary cupels, perhaps because the ring acts as a heat storer and regulator.

Now, suppose the cupels have been placed upon the bench, centrally to the tuyere. They should stand off from the wall as much as $\frac{1}{4}$ of an inch. They are at yellow heat when the buttons are placed upon them and the tuyere ports are plugged. A 30-gramme button requires about two minutes to make a smoking bath; smaller buttons less time in proportion. Now the ports are opened, the nozzles are adjusted, and a gentle blast is initiated, until the right point of impact has been found by turning the handle first from right to left, then up or down. The flame is turned off altogether. The correct impact, as well as strength, of the blast will be indicated by the appearance of the bath. The latter looks bright yellow, almost white; it evolves evenly without any oscillations backwards and forwards. The rim of the cupel is dark. This indicates the proper intensity of the reaction. After the operator has gained some practice, a few seconds only are consumed in this adjustment. Passing from one tuyere to the other with the proper adjustment, the proper time distance is gained for the glancing. It would not be convenient to have several buttons come to the glance simultaneously. What goes on in the cupel at this stage cannot be expressed by a more appropriate word than "Bessemerring." The lead proves itself a fuel and disappears, as silicon and carbon disappear in the Bessemer blow. The lead fumes pass out of the vent in brown clouds. The lead diminishes its volume, as if it were running through a crack in the cupel. Thirty grammes of lead with ten milligrammes of silver have come to the glance in four and one-half minutes, and all this time the heat was shut off from the furnace. This rate of speed, however, is not commendable. Though I have obtained satisfactory results with the high speed, in the general run the silver results are too low. Buttons from gold assay fusions may be run at this speed without fear of loss. The rate of oxidation is greatest at the beginning, as may be expected, because the air has a larger surface to work on. In the meantime the operator sits on a low stool and watches the progress through the tuyeres. He is not allowed to be idle, however. He keeps pulling the cupels forward by means of hooked $\frac{1}{4}$ -inch wire, operating through the tuyere, and at the same

time depresses the nozzle. If the buttons are neglected by the operator, the furnace will be at once too cold, and the buttons will wallow in liquid litharge. They do not freeze, as they would invariably do in the muffle under similar conditions. A turning on of the flame will re-establish the proper gait in a few moments. I find that the best speed for 30-gramme buttons is from seven to eight minutes to the glance. How long a 30-gramme button requires in the muffle every assayer knows, and the large gain in time afforded by the blast method is evident, not to mention the comfort arising from looking through a 0.75-square-inch aperture into a dull red heat, as against 13 or more square inches of bright redness. To appreciate this, however, one must have felt the difference; words cannot convey the sensation. As soon as the glance is observed the operator, holding the tongs in his hand, tilts back the lid and lifts out the cupel without rising. The opening of the lid brings with it a lowering of the temperature, and just when the other buttons are nearing the glance this loss is dangerous to their safety. All danger is avoided by turning on the flame at, or, better, somewhat in advance of, the glancing of the first button.

The following may be set down as the essential and distinguishing features of this Bessemerizing of the work lead:

- (1) The cupel is relatively cool.
- (2) The lead oxide vaporizes, instead of soaking into the boneash.
- (3) The speed is from four to six times greater than in the muffle.
- (4) The personal comfort of the assayer is greater.
- (5) The loss of silver, the so-called cupel draught, is apparently the same.

In regard to the fifth point, I have proposed to myself a future communication to the Institute, in which I shall attempt an explanation of the evident anomalies in the assay results, both from muffle work and from working with my new furnace— anomalies which undoubtedly have occurred to all assayers, without having been accounted for, either to themselves or to the assaying fraternity.

Sizes of Wire Screens.

So far as known there is no uniform standard for gauging wire or punched screens for battery use. Following is a compendium of what recent writers on the subject say:

| NUMBER OF NEEDLE. | 1.* | | 2.* | | 3.* | 4.* | 5.* | |
|-------------------|--|-------------------------------|----------------|-------------------------------|--|-------------------------------|---------------------|-------------------------|
| | No. of Mesh corresponding to No. of Needle | Diameter of Orifice in Inths. | Number of Mesh | Diameter of Orifice in Inths. | Number of Mesh: Diameter of Orifice not given. | Diameter of Orifice in Inths. | Woven Wire Screens. | Width of Mesh in Inths. |
| 1..... | 18 | .0438 | | | | .057 | 12 | .055 |
| 2..... | 18 | .0392 | | | | .048 | 14 | .049 |
| 3..... | 20 | .0374 | | | | .041 | 16 | .042 |
| 4..... | 20 | .0340 | | | | .035 | 18 | .037 |
| 5..... | 24 | .0320 | .02 | .029 | 20 | .029 | 20 | .035 |
| 6..... | 24 | .0284 | .25 | .027 | 25 | .027 | 24 | .030 |

THE question of placing electrical conductors in or near powder magazines has been submitted to a committee of the French Academy of Sciences, who make these recommendations: All underground electrical conductors, as well as gas and water pipes, must be kept at least 30 feet from the magazine. Aerial lines should not be allowed within 60 feet, and must be arranged so that no broken wire can fall upon the magazine. If light is required inside the magazine all wires are to be in strong metallic pipes, and all switches, fuses, etc., are to be on the outside of the building. Only fixed lamps, protected by a second envelope of glass, may be used, and no current should have a voltage higher than 110. Electric bells, only those using a very small current to be allowed, should be at least 12 feet from the powder. As all wires are liable to be struck by lightning, no distinction is made between telegraphic conductors and those carrying the powerful currents needed for light and power.

A RUSSIAN COMPANY is being organized to build a pipe line from the Grosni oil field to Astrachan, 300 miles, and will call for the necessary supply of pipe, the value of which is estimated at 12,000,000 roubles, or about \$6,000,000. The contract will be let either to one concern or divided among no more than two. Prices on both iron and steel pipe, together with connections, are to be quoted f. o. b. Novorossisk on the Black sea. Prices should be given for 8, 9, 10, 11 and 12-inch pipe. Dates for delivery have not yet been fixed.

Coast Industrial Notes.

—M. Lee of Baker City, Or., last week sold 12,000 sheep for \$27,000.

—The Lewiston, Idaho, branch of the Northern Pacific Railway is finished.

—About 500 tons of Columbia river salmon are on cold storage in Astoria, Or., for shipment to Europe.

—The amount of wool stored in Baker City, Oregon, is 550,000 pounds. Its estimated value is \$55,000.

—The wages paid on the Southern Pacific Railroad system averaged \$2.57 a day for the year ending June 30th, '97.

—Our new Hawaiian possessions in the Pacific have an area of 6740 square miles. A cable thereto is next in order.

—A cable is again urged between San Francisco and the Farrallones within a year. The cost would be about \$100,000.

—The California Canneries Co. of San Francisco have made a shipment, overland, to Liverpool of ten carloads of apricots.

—The City Council of Santa Barbara, Cal., will buy a pumping plant at a cost of \$6000 to draw sea water for street sprinkling.

—The North Pacific land department during the year ending June 30 sold 616,679 acres of land, of which 500,000 were in Washington.

—The amount of money put into circulation in Grant county, Oregon, by sheep and cattle buyers this year is estimated at \$100,000.

—The Santa Fe oil wells near Fullerton, Cal., are producing an average of 200 barrels a day. The payroll for labor is \$3000 a month.

—The statement of the Canadian Pacific Railway earnings for May, 1898, is as follows: Gross earnings, \$3,252,999; working expenses, \$1,326,337; net profits, \$926,662.

—It is said that the production of oil in the Los Angeles, Cal., field for June will show a shortage of 2000 barrels as compared with shipments and local consumption.

—The new union ferry depot at San Francisco was opened to the traveling public on the 13th without ceremony. It is considered to be the finest building of the kind in the country and cost nearly \$1,000,000.

—According to a Marysville paper the electric power company that put in a plant on a branch of the Yuba, near Brown's Valley, Cal., is furnishing electric incandescent lights there for 25 cents a month. This includes a twenty-four-hour service.

—T. Marshall, Twenty-eighth and Smallman Sts., Pittsburg, Pa., has been notified that he was the successful bidder on the San Francisco postoffice contract. The order calls for iron and steel structural work and shapes for the building. His bid was \$154,915.

—The Canadian Pacific Railway Company has sent up from Vancouver to the Kootenay two steel boats, which were intended for the northern service. One is to be put together at Nakusp, for work on Arrow lake, and the other at Nelson, for work on the Kootenay.

—Hawaiian banana growers bitterly regret the present war; the government demand for transports interrupts the regular steam communication between San Francisco and Honolulu, and most of the fruit intended for shipment will be unfit for sale before vessels can be secured to convey it to market.

—McLean Bros. of Redding, Cal., have a \$150,000 contract for railroad building for the Canadian Pacific Company in British Columbia. The company will build a branch line 400 miles in length to tap the Kootenay mining region. McLean Bros. have a contract to grade seven miles of roadbed and run a 3000-foot tunnel.

—The price of horses suitable for cavalry and artillery has doubled within the past three months. Cavalry horses have risen from \$60 to \$120 and the standard has been slightly lowered as to age and height. The United States Government never buys a horse whose tail is docked or otherwise changed from its natural shape.

—Upon his arrival at Manila, and when the city is in possession of the United States forces, Major General Merritt will act as military governor of the Philippines and declare that port open to commerce. When this is done President McKinley will make public the schedules which have been prepared fixing tariff duties that must be paid on goods imported into the islands.

—The American River Land and Lumber Co., Folsom, Cal., will make a log drive this fall. The capacity of the mill will be increased to 125 M. feet per day; steam will be used throughout, displacing the dynamos. The company intends to build a dam at Salmon Falls, a receiving reservoir for the logs, to cost \$20,000. The log drive for the season of '99 will consist of 20,000 M. feet.

—The San Francisco and San Joaquin Valley Railroad is filling in on Taylor street, Stockton, Cal., the site on which it will build its passenger and freight depots. Grading and embankment building are being rushed on the line between Stockton and San Francisco bay. Dredgers are working in the swamp, and seven miles of this style of roadbed will be completed before the big tunnel in the Contra Costa range is finished. Railroad building across the marshes is slow work, but the dryness this season aids considerably.

—Fleets of colliers are still rushing coal to San Francisco from the British Columbia collieries, Washington and Newcastle, N. S. W. During the last week 46,517 tons were landed at San Francisco. There were six arrivals from the Vancouver island collieries, with 16,134 tons; five from Washington, with 15,300 tons; one from Oregon, with 475 tons; and three from Australia, with 9864 tons. Notwithstanding that the coaling of the many transports has called freely on the stock, the supply keeps up with the demand. There are

thirteen vessels en route from Newcastle and Sydney, with 33,000 tons, all of which are due this month.

—It is understood that the coal which up to the present has been found in the Philippine islands is lignite, probably of the Tertiary period, and can scarcely be distinguished by the eye from true coal. There has been no systematic search made in these islands for coal. In the island of Masbate a local steamship owner drew his supplies from a bed of coal which is so tilted as to have the appearance of a vein. He supplied himself as long as his native laborers could get the coal with crowbars.

—The Oregon Telephone Company is closing the gap in its long-distance service between Portland and San Francisco. The completion of the line between Portland and San Francisco will connect the long-distance systems of the Northwest and California, make one system covering the whole Pacific coast, forming one of the most extensive and complete long-distance telephone systems in the world. It will connect Portland by telephone with every town of importance from Vancouver, B. C. to San Diego, Cal., and via Spokane and Boise City, Idaho, as far as Salt Lake City, Utah.

—The Santa Fe railroad is credited with intention to build the sixty-eight miles between Bakersfield, Cal., and its present California terminal. The Santa Fe shows renewed enterprise. It is now having built the biggest locomotive in existence designed for mountain climbing. The boiler will be of 1-inch boiler steel and cylinders whose dimensions will be 12x32 inches. It will have no "pops," as they will not be required. No fireman living would be able to build a fire that would create enough steam to burst the boiler of this mogul. The engine will have ten drivers, and it is estimated that it will be able to haul a third larger load than any engine the Santa Fe now has.

—Large sums are being expended in San Francisco by the Government in supplying the military camp there. From June 2 to July 2 Depot Commissary Bootes bought:

| | Pounds. |
|---------------------|---------|
| Fresh beef..... | 804,016 |
| Bacon..... | 78,176 |
| Flour..... | 300,875 |
| Baking powder..... | 13,898 |
| Beans..... | 3,474 |
| Rice..... | 1,158 |
| Potatoes..... | 277,958 |
| Onions..... | 69,489 |
| Roasted coffee..... | 27,708 |
| Sugar..... | 5,312 |
| Vinegar..... | 3,474 |
| Salt..... | 13,898 |
| Pepper..... | 869 |
| Soap..... | 13,898 |
| Candles..... | 5,312 |

This list represents only a small part of the quantity purchased during the time the troops have been in camp, and is suggestive of what is additionally bought for the expeditionary forces.

Recently Declared Mining Dividends.

Silver King, Utah, \$37,500; July 9.
Bullion-Beck, Utah, \$10,000; July 15.
Grand Central, Utah, \$31,250; July 15.
Mercur, Utah, \$25,000; July 15.
Pennsylvania, California, 5 cents per share, \$2575; July 16.
Victor, Cripple Creek, Colo., \$1 per share, \$100,000; July 1.
Jamison M. Co., California, 5 cents per share, \$19,500; payable Aug. 15.
Modoc M. & M. Co., Colo., 4 cents per share, \$20,000; July 15.
Associated G. M. Co., Colo., 1 cent per share, \$12,500; July 15.
Portland, Colo., 1½ cents per share, \$45,000; July 15.
The Cariboo M., M. & S. Co., British Columbia, 2 cents per share, \$16,000; July 1. The total dividends since organization are \$228,965.

Books Received.

"Present-Day Metallurgical Engineering on the Rand," by John Yates, to which is appended a treatise on the economics of the Transvaal gold mining industry, quarto, 136 pp., profusely illustrated, technical description of the engineering connected with the gold industry of the Witwatersrand district, South Africa. Several of the larger plants are described with minute detail of construction, operation and result. There is also a general review of the Rand practice. The exhaustive treatise regarding the status of the Rand mining industry at the time it was written is also a valuable contribution to expert statistical knowledge on that subject. The work is published by the Mining Journal, London, England; price 21 shillings, postpaid.

Catalogues, Etc.

The third edition of Catalogue No. 2, "Gold and Silver Quartz Mining and Milling Machinery," of the Joshua Hendy Machine Works is issued, an up-to-date description of the various forms of milling apparatus manufactured and for sale by this company, handsomely illustrated by sectional scale drawings and electros. In addition to the detailed description appears what are practically treatises on mine economy. A six-page article on "Practical Suggestions to Mine Owners, Managers and Superintendents of Mines," is a sensibly written article of value to any miner or mill man. A five-page article "Suggestions to Amalgamators and Millmen" embodies many practical points and information that could be read with profit by many. The last fourteen pages of this 168-page book are devoted to tables, standard rules, etc. It will be sent postpaid anywhere by addressing the Joshua Hendy Machine Works, 38-44 Fremont St., San Francisco.

Personal.

W. S. KEYES of San Francisco has gone to New York city.

WALTER HOVEY HILL's present address is Lewiston, Idaho.

R. H. POSTLETHWAITE of San Francisco is at Smartsville, Cal.

J. LAZINSKI a mine owner at Globe, Ariz., is in San Francisco.

CHAS. BUTTERS has returned from Kennett, Cal., to San Francisco.

C. H. SOHEN, Gen. Mgr. Cigale Co., Cigale, Utah, is in San Francisco.

H. McDONNELL of San Francisco has returned from New York City.

J. H. TIMBETS of San Francisco is examining mining property near Angels, Cal.

W. B. MARTIN, owner Mayflower mine, Nevada City, Cal., is in San Francisco.

R. C. WALRATH, Mgr. Reward mine, Nevada City, Cal., is in San Francisco.

R. MUIR, a mine owner from Nevada City, Cal., has returned from San Francisco.

R. DILLER, Supt. Dix mine, Magalia, Cal., has returned home from San Francisco.

HON. J. H. NEFF, Pres. Cal. State Miners' Association, has gone to Bartlett Springs.

D. MCINTOSH a mine owner from Weaver-ville, Cal., has returned from San Francisco.

J. C. DIAMOND, Supt. Limpensel mine, Placerville, Cal., has returned from San Francisco.

J. O. RUSBY, Supt. Risdon Iron Works Hydraulic Co., Oro Fino, Cal., is in San Francisco.

J. C. STEELE, Supt. Grizzly mine, Trinity Center, Cal., has returned from San Francisco.

W. T. WATTS of the Cal. State Mining Bureau is exploiting southern California oil fields.

A. WARTENWEILER has returned to San Francisco from his Red Banks mine at Mariposa, Cal.

H. S. MCKAY of Boston, Pres. Boston & Mercur Milling Co., will arrive in Salt Lake July 31st.

L. R. POUNDSTONE, Supt. Big Canyon mine, Shingle Springs, Cal., has returned from San Francisco.

J. S. GOODWIN, managing owner Red Dog mine, You Bet, Cal., has returned from San Francisco.

J. WEISSBEIN, managing owner W. Y. O. D. mine, Grass Valley, Cal., has returned from San Francisco.

CAPT. J. R. DE LAMAR is in Paris, France. He expects to return to Salt Lake City, Utah, in two months.

C. C. BARR of the Geological Survey is arranging for government work in the vicinity of Missoula, Montana.

GEO. A. ANDERSON, Gen. Mgr. for the MacArthur-Forrest Cyanide Co., at Denver, is in Salt Lake City, Utah.

J. F. WEBB, managing owner Pocahontas mine, El Dorado, Cal., has returned from St. Louis to Placerville, Cal.

T. W. DUFF, London, England, is visiting the Poorman mines, in which he is interested, at Silver City, Idaho.

P. C. STROES of Spokane, Wash., is examining mining properties in Alaska for the B. C. Development Co. of England.

A. H. TRIGIDOO left Dawson City, N. W. T., June 20, and expects to reach San Francisco the latter part of this month.

H. F. BROWN of Chicago, who has been putting in roasting furnaces at the Golden Gate, Utah, mill, is recuperating at Auburn, Cal.

C. M. WELBY is Supt. of the Golden Eagle and Ida May properties at Republic, Wash. He is also developing the Transit and Micawber claims.

A U. S. TOPOGRAPHICAL surveying party—R. B. Marshall, E. G. Hamilton, S. F. Hooper—are at work in the high Sierras west of Yosemite Park, Cal.

C. H. JAMES, who recently returned from South Africa, is in Shasta Co., Cal., securing a lease from the Sierra Buttes Co. to work the old Uncle Sam mine.

DR. CAPELL WHITEHEAD, assayer for the bureau of the mint, treasury department, is in Seattle, Wash., establishing the Government assay office in that city.

BARON E. DE LA GRANGE of Paris, president of the LaGrange Hydraulic M. Co., near Weaverville, Cal., has returned to San Francisco after a visit to the mines.

F. A. HUNTINGTON, the mining engineer and manufacturer of the widely known Huntington roller mill, has moved his office to room 1, third floor, Mills building, San Francisco.

W. E. BARROWS of Philadelphia and D. T. Day, statistician of the United States Geological Survey, were at Weaverville and Junction City, Cal., last week, looking for platinum and iridium.

MR. A. S. HALLIDIE has returned from an extensive inspection of industrial schools on the Atlantic slope, in the interests of the projected Wilmerding school in San Francisco, and has embodied the results of his trip in a report to the regents of the University of California.

MAJOR A. J. MYERS of Siskiyou Co., Cal., is in San Francisco to secure the acceptance of the company of Siskiyou county riflemen that he organized. The fact that cavalymen are needed at Manila encourages the Major to hope for an early acceptance of the Siskiyou Rough Riders.

DR. GEO. S. BECKER of the U. S. Geological Survey sailed yesterday on the City of Puebla, which left San Francisco as part of the fourth Manila expedition. He will make a

geological reconnaissance of the most important of the Philippine group, to be incorporated in a Government report on the mineral resources of that region.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING JULY 5, 1898.

606,986.—PROPELLER—Carter & Buhles, S. F.
606,712.—AIR BRAKE—F. L. Guillemet, S. F.
606,718.—WRITING TABLE—E. W. Hill, Corte Madera, Cal.
606,730.—RAILWAY SWITCH—W. McCaffery, Tyler, Wash.
606,677.—PIPE COUPLING—Morrison & Hansen, Seattle, Wash.
606,823.—TREE PROP BRACKET—G. S. Myers, Riverside, Cal.
606,934.—SPRING WHEEL—M. O'Brien, Fresno, Cal.
606,810.—SAVING GOLD—J. W. Pack, S. F.
606,815.—MECHANICAL STOKER—F. A. Stevens, S. F.
607,003.—MANUFACTURE OF GLASS—C. G. Van Fleet, Los Angeles, Cal.
606,905.—SLEIGH AND BOAT—L. Weber, Roslyn, Wash.
28,005.—DESIGN GAME BOARD—Minnie Goldstein, S. F.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co. by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

AIR COMPRESSING WAVE MOTOR.—John H. Leonard, Leonard Station, Cal. No. 606,561. Dated June 28, 1898. This invention relates to an apparatus which is designed to utilize the movements of waves or swell of the ocean, and in connection with this feature is a combination of air compressing pumps and other connected mechanism. The invention consists essentially of a float or floats hinged or journaled at one end to a vertically adjustable framework and having the other end free to move up and down by the action of the tide. Air compressing cylinders are situated in the line above the movable end of the float guides and slides with which the piston rods of said cylinders are connected, and a pitman connects the slide with the float so that its movements act to compress the air within the cylinders. From this compression the air is conveyed to a second set of cylinders which take the partially compressed air and further compress it into suitable receivers. By means of racks, and pawls which engage these racks, the rising and falling of the float by variation in the tide is compensated and the movement of the pistons in the air compressing cylinders is maintained in proper relation thereto. The compressing cylinders have balanced valves interposed in the passages between the receivers, with springs pressing upon them to close them against the passage of air from one receiver to another until the pressure in the first receiver has reached the desired tension, the valves being opened by any surplus pressure so as to equalize the tension between the adjacent receivers.

MECHANICAL STOKER.—Fred A. Stevens, San Francisco, Cal. No. 606,815. Dated July 5, 1898. This invention relates to a device which is especially applicable for use upon locomotive engines, although it may also be employed for any form of boiler furnace, and it is designed to feed fuel in a pulverized form into the furnace and to spread and regulate it from side to side and front to rear. It consists essentially of a vertically journaled chamber standing in front of the firebox, with a pipe projecting therefrom and delivering into the firebox, steam and air passages discharging into the chamber and through the discharge pipe, a mechanism by which the chamber and pipe are oscillated transversely, a receiving passage above the chamber and a crushing device through which the fuel is passed and delivered into the hopper and chamber. In conjunction with this is a vertically oscillating apron over which the discharge from the chamber takes place, and by means of which the fuel is distributed from front to rear of the furnace, and this in conjunction with the side oscillations of the chamber serves to spread the fuel perfectly and in a thin sheet throughout the whole furnace.

PROPELLER.—S. W. Carter and W. C. Buhles, San Francisco, Cal. No. 606,986. Dated July 5, 1898. This invention relates to a novel construction for propellers. The object is to employ the propulsive force of water ejected upon the edges of the propeller blades under high pressure so that the propeller is rotated by the action of the water upon the surrounding medium. The propeller has a horizontal shaft with passages through the blades which connect with the hollow shaft and thrust bearings formed of balls. Outside of the hollow shaft is a sleeve with means for adjusting it so that the openings in the sleeve may be brought into line with a set of passages in the propeller blades which will act to drive the vessel ahead, or it may be reversed so as to cause the vessel to back.

Recent California Mining Incorporations.

Sonora Mines Co., San Francisco; capital stock \$100,000, subscribed \$52,500; J. McNab, J. D. McGilivray, J. R. Hall, J. Reid, R. Park.

Methods for Preparing Proof Gold and Proof Silver.

TO THE EDITOR:—I submit to you for publication the following methods for preparing both proof gold and proof silver. After a number of trials I have finally developed these methods to my entire satisfaction, and find the results are accomplished in a much shorter time, and with a greater degree of accuracy, than by the old methods.

After assuring myself of the correctness of these methods I have continued to use them, and in 1896 I wrote the Director of the Mint, giving to him a full description of the results I had obtained in this manner. As this may be of interest to others who are called upon to prepare their own proof metal, and knowing your paper has a large circulation among those engaged in this class of work, I am confident it will reach many of them through your columns, and possibly be of some service to them. JOHN W. PACK, Assayer U. S. Mint, San Francisco. July 11th, '98.

In the preparation of proof gold, after having dissolved several ounces of fine gold in nitro-muriatic acid, allow to stand several days that any silver chloride present may settle, filter the solution, then evaporate to crystallization as usual. The manner of converting the gold from chloride to metallic constitutes the difference between this method and the old. After diluting copiously with distilled water, I place the solution in a receptacle from which it is allowed to pour slowly into a glass jar containing several pieces of pure aluminum; the gold is at once converted from chloride to metallic, a great amount of heat being generated. Remove the larger pieces of aluminum, pour off the solution, wash the gold precipitate several times to remove any acid. Then add muriatic acid, and heat to dissolve any small particles of aluminum, after which wash well till free from acid; then dry and melt the gold, which should be proof 1000 fine if proper care has been exercised.

In the preparation of proof silver, I select silver as free as possible from any gold, dissolve in nitric acid and allow to stand for several days that any traces of gold may completely settle; precipitate the silver as chloride, stirring well as precipitation takes place, thus causing the silver chloride to be finely divided; then pour off the acid solution and wash the precipitate well with water.

Place several pieces of aluminum in this chloride of silver precipitate and add sufficient water to cover, then add a small amount of muriatic acid to start reaction; in a short time the chloride will be converted to metallic silver. Remove the larger pieces of aluminum and wash the silver, then add more muriatic acid, and heat to dissolve any small particles of aluminum; wash again well till all acid is removed, then dry and melt the silver, which should be 1000 fine.

An Electric Brake.

To get over the difficulties experienced with hand brakes, the Kubierschky electric brake has been invented. It is composed of four steel segments and coils enclosing one of the car axles, the segments being bolted together and acting as a brake shoe, thus forming a rigid system that is bolted by means of a projecting shank to an arm arranged in the under frame of the car. In front of the shoe is an iron disc, fixed and keyed to the car axle, which forms the armature to the shoe. This is held at its proper distance from the shoe by springs. On a current being passed through the coils the friction surface of the brake shoe is brought into contact with the disc, checking the rotation of the axle and the progress of the car. At Dresden the application of the brake to a seven-ton car traveling at fifteen miles an hour brought the car to rest within a distance of 40 feet.

THE British government, says the *Inventive Age*, has adopted successively

three different American guns for its army, and paid liberally for the patent in each case. The first was the Schneider-Enfield gun, by which the Enfield muzzle loader was converted to a breech-loader. The second was the so-called Martin-Henry, which was the Peabody gun simply changed from rim-fire to center-fire, and last the Lee-Metford, which is the Lee gun with some slight alteration of the breech bolt suggested by Colonel Metford. Germany, Switzerland, Austria and the other European governments simply appropriate inventions, make some slight alteration, give them a German, Swiss or Austrian name and never recognize the inventor at all.

Glass Fenceposts.

A dispatch from Muncie, Ind., says that a glass firm there has received an order for 500 glass fenceposts, to be of the usual size and grooved for the reception of wire. It is added: "The order has caused some speculation and is probably an introduction of an important article of trade." It is an interesting illustration of the tendency of modern science and inventive genius to discover new uses for old materials. One day it is the conversion of the pith of the cornstalk into a valuable article of commerce, and the next the application of glass to a practical purpose hitherto unthought of. The twentieth century may be the age of glass. It has not been very long since the metals or hard woods were regarded as the only fit material for use where strength and durability were required. Now paper is converted into materials for house building, furniture, railway car wheels, boats, and utensils of various kinds. Glass is used for even more purposes, and its increasing cheapness and improved methods of working are likely to bring it into still wider use. No other material invented by man can be compared with it in the service it has rendered, both in common life and in chemistry, astronomy and other sciences. Pure beyond the possibility of contamination, indestructible by any chemical agency, the right hand of science and the foundation of the telescope, the material for thousands of utensils and ornaments, and now to be utilized for fenceposts, it comes as near being the keystone of civilization as anything that can be named. It is a long reach from oiled paper windows to the myriad uses to which glass is put to-day. As late as the sixteenth century in England only the dwellings of the wealthy had glass windows. It is reasonably certain that Shakespeare, who was born in 1564, first saw the light through lattice windows or oiled paper, and he was probably a grown man before he looked through a glass window.

Antidote for Cyanide Poisoning.

The journal of the Chemical and Metallurgical Society of South Africa reprints the following from a German exchange: "Practical experience has shown that peroxide of hydrogen may be considered a powerful antidote for cyanide poisoning. It has recently been applied successfully in 2½ to 3 per cent solution as subcutaneous injections, which were performed every four minutes at different parts of the body. At the same time the stomach was washed out with a 2 per cent H₂O₂ solution.

"Peroxide of hydrogen forms with hydrocyanic acid oxamide, which is a harmless compound: 2 HCN + H₂O₂ = 2 CONH₂ = oxamide."

THE Spanish soldier is a frugal liver, his commissariat allowance being two meals a day—one at 9 A. M., the other at 5 P. M. In some corps coffee and soup are served out in the early morning. A pound and a half of bread a day constitutes the Government ration; any food beyond this must be bought by the private at the canteen. He gets little meat, and keeps in excellent condition on a chunk of dry black bread, a little oil, and a clove of garlic

a day. If to this he can add a pint of wine, which tastes like vinegar and water, he feels happy. There is one thing he cannot go without, and that is his cigarette.

Changing the Form of Stone Under Pressure.

Experiments conducted by Adams and Nicholson at McGill University, Montreal, have resulted in the discovery that by pressure marble can be molded into any desired form while retaining its strength.

This shows however brittle a rock may seem to be, it is in reality a plastic substance, capable of flowing into new shapes. The experiments so far have been made with marble. Columns of marble two centimeters and two and one-half in diameter and four centimeters in length are accurately turned and polished. Heavy wrought iron tubes are then made, imitating the plan adopted in the construction of ordnance, by rolling long strips of Swedish iron and welding the strips to the bar as they are rolled around it. When the welding process is completed, the core of soft iron around which the Swedish iron has been wound, is drilled out, leaving a tube of welded Swedish iron six millimeters thick, and so constructed that the fibers of the iron run around the tube, instead of being parallel to its length. The tube is then accurately fitted on to a column of marble, by giving a slight taper to both the column and the interior of the tube, and so arranging it that the marble will pass only half way into the tube when cold. The tube is then expanded by heating, so as to allow the marble to pass completely into it, and at the same time leave about three centimeters of the tube free at either end. On allowing the tube to cool, a perfect contact between the iron and the marble is obtained, and it is no longer possible to withdraw the latter. Any very slight failure to fit at any point, if such a failure exists in any case, is rendered harmless by the fact that, under a comparatively low pressure, the limestone is found to be sufficiently elastic, not only to fill up any such minute space, and, on the pressure being relieved, to contract again to its original form, so that it will drop out of the tube which has been thus enlarged.

When the marble has been firmly placed in position in the tube, an accurately fitting sliding steel plug is inserted in either end, and by means of these the marble is submitted to a pressure far above that which would be sufficient to crush it if not so enclosed. The machine employed in obtaining the pressure is so arranged that it (the pressure) might be maintained for weeks, or even months. Under these circumstances, the conditions of pressure to which the marble is subjected are those to be found in the "zone of flow" of the earth's crust.

Under pressure applied gradually, and in some cases continued for weeks, the tube is found to slowly bulge until a very marked enlargement of the portion surrounding the marble takes place. The tube is then cut longitudinally, along two lines opposite to one another. The marble within is found to be firm, so that it holds the respective sides of the iron tube so tightly that it is impossible without mechanical aids to tear them apart. By means of a wedge they can be separated, the force of the blow frequently splitting the marble through longitudinally. In one experiment a column of marble was reduced from forty to twenty-one millimeters in height. The deformed marble differs from the original rock in having a dead white color, the glistening cleavage faces of calcite being absent. Although not so hard as the original rock, it is still firm and compact, especially so when its deformation has been carried out slowly. No accurate measurements as to its strength have yet been made, but it will withstand a very sharp blow, and fragments of it weighing ten grams have been allowed to fall from a height of over 8 feet on to a wooden platform, rebounding without breaking.

Limestone and marble, even when

dry and at ordinary temperatures, possess a certain degree of plasticity and can be made to flow, the movements set up developing many structures characteristic of rocks which have been squeezed or folded in the deeper portions of the earth's crust. The average pressure employed in molding the marble is 80,000 pounds to the square inch.

Depreciation of Tools.

In estimating the value of a manufacturing plant, either for inventory purposes or for a statement of assets, one of the most uncertain elements to be considered is the real value of the tools. In the case of a machine shop, for instance, large sums have been expended for machine tools, lathes, planers, drill presses, etc., while the motive power, engines, boilers, shafting, pulleys and other details, all represent investments which, while at work, are returning interest upon their cost, but which are also constantly depreciating at an unknown and variable rate. Investigation of the practice of existing shops reveals almost infinite methods of treating this feature, each shop having its own method and no two systems being exactly alike. Some make no attempt at system, merely estimating the value each year, practically only another name for guessing. Others keep an elaborate record, based on the first cost of each machine, depreciating at a fixed percentage rate every year, quite regardless of the fact that the value may bear but small relation to the cost in the first place, and none at all after a few years.

A tool or machine may be obsolete in a short time, and although in perfect condition the owner may simply be unable to afford to use it in competition with rivals possessing machines of later design, greater capacity or more economical performance. Even when no radical advance is made, the steady improvement in capacity, speed and perfection of product of modern tools is a factor which has a most important influence on the relative value of older machines. In such cases the question is not "how much is the old machine worth?" but "how soon will it be obligatory to us to replace it?"

One way of meeting this question which is in vogue in certain shops is to work a tool for all it is worth, putting only such repairs on it as are absolutely necessary, and driving it to death, so to speak, before it becomes superannuated. The increased product under such a method provides for the rapid rate of depreciation. The tool wears out rapidly, indeed, but by the time it is worn out it has repaid its first cost on the increased output, and can properly be sunk as an asset. In certain lines of work this system is not only possible, but justifiable, but it is only a busy shop, and a management with the moral courage to refrain from passing the increased output to profit account, which can use the method to advantage.

It is evident that different parts of a plant depreciate at different rates. A boiler, for example, is steadily wearing out from the time it is first installed until the day when the inspector cuts down the working pressure below the shop requirements; while an engine of good make, with an occasional reboxing of the cylinder, and facing of valve seats, will outlast many boilers, and be a good asset still. The same is true of tools, and any system which includes all under one fixed depreciation rate must be only a crude approximation of the truth.

By taking the valuation of standard tools at the price for which they could be replaced, with a reasonable reduction for wear and tear and by making large depreciations for special tools, or those only occasionally used, a reasonably correct inventory may be made. The "weather eye" should always be kept well open, however, for the progress of improved tools and methods, and machines which are likely soon to be superseded should be compelled to work their own destruction as the only means to their own salvation.

Mining Summary.

CALIFORNIA.
Amador.

A meeting of the stockholders (J. B. Haggin holds 99,000 of the 100,000 shares) of the Amelia G. M. Co. has been called for July 19th to vote upon a proposition to sell the property of the company. The meeting has been called in the name of Mr. Haggin.

Republican: Repairing and sinking at the Zella, Jackson, has begun, and mining proper will be carried on as a secondary consideration during the time required to make the contemplated improvements. At present about eighteen of the forty stamps will continue in operation. The shaft at the Amelia mine is down about 650 feet, and sinking continues. Prospects are favorable. Work continues at the Anita mine. The south extension of the old Keystone mine, Amador City, has a shaft down 225 feet. A 160-foot crosscut has been run. At the Good Hope mine little work is being done. Talk of renewing work at the Alma mine has died out.

Record: The new hoisting machinery at the Lincoln mine at Sutter Creek has started up. Everything is in satisfactory working order. A full crew was put at work in the shaft; it is timbered to a depth of 108 feet. E. C. Voorheis is Supt.

Ledger: Mr. Brunt, who has secured the Wheeler mine and 5-stamp mill at Plymouth, has opened up the property and will put in fifteen additional stamps. At the Oneida Supt. Truscott will make a mill test of 500 tons.

Butte.

J. M. McClung has bought the interests of Titus & Fitch in the Mammoth mine, near Enterprise, and will develop the property.

The Reed Co. has purchased the Parsons mine, near Rackerby, and are putting up a 5-stamp mill. The Little California mine and five stamps, near Buck's Ranch, are working steadily.

A 4-stamp mill is in operation on fair grade ore at the Braselton mine, near Robinson Mill.

The *Mercury* says that 40,000 pounds of machinery were taken to the North Fork of Feather river, to be used in prospecting the river bed. The company controls eight miles of river bed, much of which is believed to be virgin ground. D. M. DeLong, who is interested in the enterprise, will be Gen. Mgr. At the Green mine, near Buckeye, the new mill has been started and is running on good ore.

The *Honcut Times* says that the Cascade mine, near Bangor, will soon resume operations. A crushing from the Buffalo mine, at Oregon House, yielded \$18 a ton. M. Van Leight contemplates putting a mill on his Sky-high mine, near Merrimac. J. Flood has begun work on a quartz property near Enterprise. M. Spencer of San Francisco, who is interested in the Butte King and Queen mines, near Gravel Range, will resume work.

Calaveras.

Wm. H. Clary has bought the Haggin and Hearst interest in the Sheep Ranch mine for \$60,000. He recently put in new machinery and an electric plant, incorporated a company and intends to place the property in producing condition.

The Royal mine near Copperopolis is increasing its number of employees under the new management, and also its plant capacity. Underground surveying has been in progress at the Gwin mine for several days. The old shaft has been cleaned out and getting ore out of the new shaft continues.

Colusa.

A. A. Gibson is placing in his Wide Awake mine near Williams a blower that weighs 24,000 pounds. With the blower there is 400 feet of 24-inch pipe and several hundred feet of 16-inch pipe. Instead of using the machine to force air into the tunnel he will use it as a suction to draw the foul gasses out of the mine. The shaft is over 300 feet deep.

El Dorado.

(Special Correspondence.)—Work on the old Wheeler mine, near Placerville, has been started by J. Melton. The Gentle Annie mine, owned by Melton & Parlow, has been bonded to F. G. Lathrop of Minneapolis, Minn. The property is fairly well developed and is operating a 10-stamp mill. A. H. S. Bird of Salt Lake City, Utah, has bonded for Salt Lake men the Marguerite and adjoining claims. Some development has been done on the property. It is three miles south of Placerville, adjoining the old Tin Cup and Larkin mines. J. J. Crawford of San Francisco has applied to the supervisors for a franchise to erect poles and stretch wires on the roads and streets of the county and the privilege of putting in an electric plant for power and lighting. The Crown Point mine, on which work was begun recently, has thirty men employed at sinking a shaft and running a tunnel.

Placerville, July 12, '98. The Stony Point mine has been leased and work will begin July 15th.

A company has been organized at Placerville to operate the gravel properties of T. H. Pennock at Pacific House. The Columbus mine at Cold Springs closed temporarily. A large pump will be put in and work resumed.

Republican: The Big Canyon mine shut down for the first time since it was started by the present management. The cause is shortage of water. It will probably not be started again for six months or till the next rainy season supplies water. The chlorination works will be operated ten days longer and then close for the summer. Work continues successfully in the Umatilla gravel mine at Coyoteville.

Democrat: A. Shettell, of Salt Lake City, has bonded the Lone Star mine near Nashville and also the Monitor. He is preparing for extensive development. Roberts Bros. have bonded the Sharp mine and the ranch of

J. Maffey and are developing the property. The ledge is from 60 to 100 feet wide. Claessee & Padilla are operating on the Adams Gulch mine and taking out good rock.

Kern.

The Hard Cash mine, near Randsburg, contemplates building a concentrating plant. W. W. Tinker is managing owner of the property. The Yellow Aster M. & M. Co. has brought suit against the Henry M. Co. to recover possession of 3000 tons of tailings or value, \$4000, with \$5000 damages and costs. Work is about to be resumed on the Desert Queen mine.

Mariposa.

(Special Correspondence.)—Work was resumed on July 5th on the McAlpine mine, on the line between Mariposa and Tuolumne counties. The property, which has a record of producing over \$400,000 above the 300-foot level, has been closed for many years, and, though many efforts were made to arrange for its reopening, they all failed for one reason or another. The pay ore in the old workings was in two shoots about 400 feet apart and consisted of from a few inches to 3 feet of white quartz lying upon and frozen to the main vein of ankerite which is here 100 feet in thickness. This ore averaged over \$100 per ton. The new development will be below the old workings and will be continuous from one chute to the other.

Mariposa, July 13th, '98. **Gazette:** J. Muller is opening a slate quarry near Hornitos. The quarry covers 160 acres. He intends shipping the slate to San Francisco.

Nevada.

The Wait for the Wagon ground, which has been in litigation, was bought by the Olin people, headed by M. Blaskower and L. Leviston of San Francisco.

T. B. Gray is pushing the tunnel of his Willow Valley claim, near Nevada City, and is in 300 feet. The Stanford mine is being operated by J. Thomas & Co. under a lease. A. R. Dahlberg, French Corral, has bonded the Slide and Sunset mines to Dr. Webb and other capitalists of Los Angeles. They will commence work at once developing the properties.

The Champion Co. at Nevada City, to obtain a reliable water supply, will rebuild the reservoir which broke a few months ago.

Transcript: Hackett & Ellis are sinking on the Keystone quartz ledge near Rough and Ready. They have an 18-inch ledge, the last crushing from which went \$10 a ton in gold.

J. Deasey is putting down a shaft for San Francisco people on the Holbrook drift mine. The shaft has a depth of 80 feet; it is expected that the channel will be bottomed at 140 feet. Torpie & Co. will resume sinking on their quartz ledge. During the past year they have, in prospecting, taken out several bunches of ore that yielded from \$100 to \$900. Supt. Graham is crowding work on the Odin drift mine, near Nevada City. It is expected that by Jan. 1st the shaft will have reached the bottom of the channel at a depth of 500 feet.

Union: The Live Oak mine, near Columbia Hill, resumes work in a week. Dr. McMahon of San Jose has interested with himself H. C. Bush, C. V. Colby, P. E. Valentine and H. R. Sterne, who are inspecting the property. The Live Oak has considerable development work done; there are four tunnels in on the ledge; in all of them there is ore which runs from \$7 to \$30 per ton, the vein being of good size.

Placer.

The Dardanelles mine of Forest Hill, which has been idle for years, is said to have been sold to L. L. Chamberlain. The transfer also includes the Oro claim.

Plumas.

At the Plumas-Eureka mine, Johnsville, twelve men are employed working on tribute.

Plumas Independent: R. L. Erwin sold the tailing claim of the estate of M. Teboul on Rabbit creek for \$300 to J. Jones of La Porte. Mr. Allen, who has been driving a tunnel on the Bushman quartz ledge, has struck an encouraging prospect. He has gone to San Francisco to buy a quartz mill, which he intends to have in operation early in August. At the Golden Ancient mine on Bear creek the shaft is down 70 feet and into pipe clay.

San Bernardino.

M. Bigler proposes building a cyanide plant at Victor. The Lucky Star mine is pushing development with good results.

Shasta.

The National Con. M. Co., near Redding, shipped a carload of sulphur, to the Selby Smelting Works. The Milkmaid mine at French Gulch is shipping sulphurets in carload lots.

Democrat: Considerable development work is being done in the neighborhood of Copper City. The Minnesota mine in Flat Creek district has reached a depth of 700 feet and has a vein of fair-grade ore. At Bully Choop Crawford, Kidder and others are operating the old Byron Thompson mine and mill.

A. Temple is taking out shipping ore in small quantity. W. B. Smith is said to have sold his quartz property on Sunny Hill to a San Francisco buyer. The property is partially developed. W. Lee of Igo is running a tunnel on his claim and is said to have a favorable showing.

Free Press: Desmond Bros. at Whiskeytown made a run of six weeks and their cleanup is stated to be \$7000. Brown & Enos are taking out good rock from their claim on Noble gulch. J. P. Davis is developing a property known as the Mad Dog mine, in which he has a 5-foot wide ledge of fair grade ore. The tunnel in the Golden West mine near Muleton has reached 110 feet on a 3-foot ledge of paying ore.

Redding Free Press: The Butters chlorinating plant at Kennet, which has been idle for a number of years while its owner was in South Africa, is to be extensively improved and put in condition to resume operations.

Chas. Butters has given orders to his foreman in charge to overhaul and repair the flume and ditch. This waterway is four miles in length and the flume is 2 feet broad on the bottom. All of the buildings at the works will be repaired.

Slacktown.

News: Corey Bros. mine on French creek has been bonded to a San Francisco company. The Risdon Iron Works have closed down the Wright and Eastlick hydraulic mines at Oro Fino after a successful run, considering the scarcity of water. They will put in five elevators this fall and make other preparations for an extensive run next season. The Wademan & Williams mine, on the North Fork of Humboldt, had a crushing of ten tons of ore which yielded \$17 to the ton.

Fort Jones Reporter: Stephens & Hathaway on Sugar creek are meeting with good results in the development of their quartz property. The tunnel has reached 350 feet. They have a large ledge, which yields \$8.24 a ton. They contemplate building a mill.

Trinity.

M. Van Matre of Lewiston is shipping 500 sacks of high grade ore to San Francisco.

The Deaken mine in the Coffee creek section is said to have a ledge 6 feet wide, carrying an average of about \$10 per ton in gold and a fair per cent sulphurets.

Journal: The Mountain Boomer mine, at New River, has been bonded to J. Frank, C. A. Hamilton, Dan Burns and M. Gunst of San Francisco. Surveyors have mapped out the summer's work. The mine will be thoroughly opened up and prospected by development tunnels and shafts. A large amount of work will be done. Young & Sprague have purchased the old Hitchcock gravel property, near Weaverlyville. In drifting under the old bank they struck pay dirt in good quantity, taking out as high as \$4 to the pan. The gold is coarse.

Tuolumne.

The 10-stamp mill at the Providence mine, near Sonora, will be in operation in two weeks. Sixty-five men are employed. The Grizzly mill is running on high grade ore. The shaft in the Tarantula has reached 300 feet and will be continued to the 600 mark. Good ore is being taken from the first and second levels.

The Boston directors say that the earnings of the Santa Ysabel mine for the six months ending June 30 will show a small balance after deducting operating and construction expenses.

Near Jamestown the Peoria Gravel Mining Co. is handling at a profit the cement gravel in Table mountain, working from 300 to 350 tons daily with 2 miners' inches of water. The rifle tables have a side motion, which keeps the pulp agitated and allows the fine gold to settle.

Magnet: The Kendall mine, near Stent, is being examined by Philadelphia people. The ledge is 11 feet wide, charged with sulphurets.

Independent: A 10-stamp mill is building at the Mt. Jefferson mine, near Groveland. J. M. Meigham is Supt. The mine is owned by a company incorporated under the laws of Maine. The property is being developed by three shafts, which are 95, 100 and 135 feet in depth. Sinking will be continued until 400 feet is reached. The Longfellow mine, Big Oak Flat, will resume work immediately. The Mexican group of mines at Big Oak Flat will soon build a mill. The shaft at the Moody mine is going down, with encouraging prospects.

Magnet: Barton & Co. have bonded the Arctic group of mines, near Jamestown, to a Boston company for \$50,000. Work began July 15th. The Excelsior and Sweeney claims, near Sullivan's, have been bonded to New York mining men. Eckel & Goodwin have bonded the Green & Tibbitts mine and have begun work. In the Mt. Jefferson about 400 tons were milled, showing an average value of \$18 a ton. A 10-stamp mill will be in operation in about five months. Work on the Bown mine was resumed last week.

Yuba.

The Marysville *Democrat* says that work in the mine of the Good Title Co. at Indiana Ranch has ceased. The quartz is low grade.

Marysville Appeal: The Pennsylvania mine at Browns Valley will resume operation after the respite awaiting the introduction of electric power. Pumping will begin in a few days and as soon as unwatered Mgr. Campbell will place 100 men at work in mine and mill. On the 800 level is a ledge that will mill \$10 per ton. The ore body averages from 8 to 11 feet in thickness. From 1861 to 1870 this ledge produced several million dollars to a depth of 800 feet, where, owing to primitive pumping facilities, it was abandoned until opened recently by the Webb M. Co.

NEVADA.

The Dexter mine of Tuscarora shipped \$120,000 last week, consisting of a brick of \$6500 and auro-cyanides from which \$5500 was derived.

The Diamond mine at Eureka employs sixty men. C. Read is the Gen. Mgr. There are over 1000 tons of ore at the Gold Crown mine at Siegel awaiting teams to haul to Oasis, on the Oregon Short Line. The price paid for hauling is \$12 a ton.

Lyon County Times: M. J. King will work the black sand that he catches while sluicing for gold in his property in Gold canyon. This sand carries with it the fine gold that is washed out by hydraulicking, and some of it worked in the Silver City mills has returned from \$40 to \$60 per ton. Repairs are being made on the Washoe mill near Silver City. When completed the mill will start up on ore from the Justice mine. The Washoe mill will handle custom ore when not running on Justice rock.

Pioche Record: The proposition of the miners and millmen of the Nevada M. Co. to work the property themselves until they paid their way out, after several days discussion of details, ended in an agreement satisfactory

to all concerned and work at the mine and mill has resumed.

OREGON.

Neff & Wright have built 700 feet of wing-dam near Gold Hill, and will soon commence mining the bed of Rogue river.

Democrat: The reduction of 100 tons of ore from the Collateral mine, an adjoining claim to the Virtue, near Baker City, was finished at the Virtue mill, and, while the exact yield per ton has not been made public, it is known that the returns were satisfactory to Col. Thompson, holder of the bond on the property. Col. Thompson has under consideration a plan that will likely result in the resumption of work in the Virtue camp. It is understood that he intends running a crosscut tunnel to get depth on the Collateral vein. When the crosscut is finished, it is proposed to get the Virtue mill plant and operate the Collateral in a practical manner.

Times: The Seattle M. Co. is enlarging its ditches in Watkins district, near Jacksonville, and will resume piping at an early date. W. B. Comstock has struck a small seam of high grade ore. The Sterling mine is making its annual clean-up.

WASHINGTON.

The Northern Stake placer mine at the mouth of the Salmon river, near Boundary, reports striking a pay streak and that a \$30 clean-up was the result of three days' washing. These bars are above the workings of forty years ago.

A strike has been made by Johnson & Barton near Cedar canyon that assays 270 ounces silver. Work has been resumed on the Deer Trail No. 2, after having shipped all ore from the dump. There is a 4-foot body of ore. At Republic the Little Cove will resume drifting. A shaft is down 140 feet and a drift run same distance, but water caused work to be suspended. When work ceased the drift was in solid ore averaging \$20 per ton in gold. At Meyers Falls the Acme mine discovered ore 7 feet wide of silver-lead and of high grade.

The Horace G. M. Co. have begun work on the Horace claim, near Belleville. The Republic M. Co. shipped ten carloads of ore of twenty tons each during June. Returns have been received from the smelter for the first five carloads, which yielded 11.88 ounces gold and 9.3 ounces silver each.

BRITISH COLUMBIA.

The ore shipments from Rossland for the week ending July 9 were 1431 tons.

Since the smelter at Trail went into possession of the Canadian Pacific Railroad Company, that concern has reduced the cost of freight from Rossland to Trail, and of treatment at the Trail smelter from \$11 to \$7.50 a ton. The smelter is being changed from a two to a five-furnace plant, to handle 750 tons every twenty-four hours, and treat sulphide and silver-lead ores from the Slocan.

The electric plant of the West Kootenay Co. has been completed and 1000 H. P. transmitted thirty miles to the mines about Rossland.

The Silver Queen M. Co. is putting in a compressor and water power plant near Rossland at a cost of \$8000, and a matting plant is contemplated at a cost of \$15,000.

Smelter returns from the ore sent from the Mollie Hughes at New Denver netted \$98 per ton. The ore ran 554 ounces in silver and \$10 in gold.

The Arlington mine near Slocan will resume work Aug. 1. A meeting of the Lardo-Duncan Association was held at Kaslo to consider a proposition from H. Sutherland, representing the Ore Reduction Co. of London, Eng., to erect concentrating works, tramways, etc., in the Lardo-Duncan region. Resolutions were passed endorsing the plan. It is reported that \$5000 was the result of the recent cleanup after a run of twenty days of the 10-stamp mill on the Joe Dandy mine at Fairview.

Rossland Miner: The tunnel on the Paris group, White's camp, in the Boundary country, is in 200 feet and will have to be run 600 feet before the ledge is tapped at a depth of 275 feet. An air compressor plant is contemplated. At Old Ironides twenty-five men are employed. Work is being pushed on the Royal Banner in Summit camp, which is bonded to an English company for \$30,000. The shaft is opening a body of quartz sprinkled with iron, copper pyrites and copper. Arrangements have been completed to expend \$30,000 on the Oro Dinero property, in Summit camp. The Oro Dinero is owned by J. M. Burke and others. The vein on the Boston, one of the Bannison group, East Kootenay, has widened from 12 feet to 40 feet.

Kootenai: In the Whitewater Deep mine near Kaslo the first tunnel taps the lead at a distance of 800 feet and at a depth of 1000 feet. Above this point, and before it is cut off by the Whitewater side line, there is an average of 300 feet the entire length of the ore chute, which has been demonstrated above to be more than 1000 feet. No stopping has been done. The plan is to push development with a view to uninterrupted shipping operations from the beginning. Three shifts make an average of 4½ feet per day. A force is engaged in clearing a site for a power and compressor plant. A tunnel will be run 1800 feet and 500 feet below the present workings. Sixty men are employed. R. E. Brown is Gen. Mgr.

ALASKA.

The Secretary of the Interior has approved instructions for the guidance of local officials in their administration of the Act extending the homestead laws and providing for the right of way for railways in the district of Alaska. These instructions were prepared by Commissioner Herrmann of the General Land Office and constitute the first promulgation of the Act approved May 14, 1898. An important ruling is to the effect that the section is inoperative which extends to citizens of the Dominion of Canada the same rights as are ex-

tended to our citizens in British Columbia in regard to mining lands. A roadway 60 feet in width, parallel to the shore line as near as practicable, is reserved for the use of the public as a highway. The shore line is held to mean high-water mark. This reservation will not prevent the location and survey of a claim down to the shore line, for in such cases the claim will be subject to this servitude, and the area for highway will be computed as a part of the area entered and purchased. The Interior Department may authorize the sale of timber under certain conditions, but no timber taken from the public lands and sold in this way can be exported from the district of Alaska. Actual settlers, miners, etc., may use not to exceed \$100 worth of timber from public lands each year free of expense. Land offices have been established at Sitka, Nulato and Circle.

THE KLONDIKE.

The usual ridiculous falsehoods continue to be put out by the transportation companies and others about the gold "coming down." First it was \$40,000,000, then \$30,000,000; now it is \$20,000,000. Eighteen men recently arrived at Seattle from Dawson. It was immediately wired broadcast that they brought \$500,000; then they had surely \$500,000. The *Times* of Seattle, which had been "booming" these things, became disgusted at the falsity, and in its last issue more sensibly says:

"Has anybody been able to find out what those eighteen Klondikers really brought out from Dawson City, either in gold or drafts? The captain of the vessel declared that the least had \$500 and the highest not to exceed \$2,000, or an aggregate of about \$15,000 all told. While, of course, \$15,000 is not \$500,000, the difference represents only the difference between honesty and cheating, between truth and falsehood. Still, when one considers that these eighteen men all told could not have earned and saved \$10,000 above their living expenses if they had stayed at home, the fact that they were able to clean up \$15,000 ought to have been satisfactory—and, indeed, is satisfactory to all honest men. The captain of that same boat held a letter from the Gold Commissioner of the Yukon country to the effect that there was '\$20,000,000 ready to be shipped from Dawson City,' and that all of this gold had been taken out by about 5,000 men. This would represent \$4,000 in gold to each individual on the average, and certainly is a most wonderful report. Then why not tell the truth about the returning Klondikers and the money they bring instead of lying about the same a thousand fold, especially when the truth is good enough?"

UTAH.

The Horn Silver mine at Frisco last week shipped six cars of silver and lead ore.—The West Argent at Stockton made an ore shipment of good values. The Honoria made a shipment from the same locality.—The Lone Pine mine at Bingham has made its fourth shipment for this season.—Capt. J. R. De Lamar says he will expend \$150,000 in the enlargement of his mill at Mercu.—The Buckeye mine at Tintic has been bonded to Judge Green for twenty-one months for \$75,000. The property has been prospecting to a depth of 400 feet and good ore has been found. Pumping machinery will be put in and sinking continued.—L. Holbrook, Mgr. of the Grand Central mine at Mammoth, says the company will acquire a reserve of \$100,000, and after that he will advocate the payment of extra dividends.—Mgr. Derrn of the Mercur reports the new strikes in Nimrod ground as important as any that have been registered by the company, and in a few days ores from them will be going to the mill. At the lower point at which the ore was encountered the vein is heavily impregnated with cinnabar and assays show the ore to be of good quality.—From Bingham it is reported that the Old Jordan and Galena, the Old Telegraph, the Niagara and Eighty-Nine are making good showing and at no time in years has there been as much development work in progress.

At the Queen of Sheba group, in Deep Creek, work has resumed under the management of C. D. Rooklidge. The company will adopt the concentrating system.—The Cyclone No. 3, Lone Star, Wild Cat and Cotton Tail, of the Jack Rabbit group, and Black Bear and Van Dyke are all silver-lead properties of more than ordinary grade, showing assay values varying from 21 to 56 per cent lead, and from \$1 to \$4 in gold. The Tea Cup and Tin Cup lodes of copper, gold and silver ore have an assay record of from 8 to 10 per cent copper, from \$12 to \$30 in gold, and from 50 to 200 ounces silver. The silver in this property appears in the shape of chlorides.—At Richfield the Advocate mine has opened a large ore body which gives good assay values.

From Alta the Darlington mine shipped 30 tons of ore and W. Green shipped 150 tons.—The Ophir Hill M. Co. shipped 200 tons of concentrates. Their mill is producing 35 tons of concentrates daily from 100 tons of crude ore. The product runs high in iron, with a percentage of copper, some silver and gold.—Two carloads of concentrates were shipped last week from the Swan Bemis mill at Bingham.—At the Dalton & Lark there are 200 tons of shipping ore on the dump and 20 to 30 tons being hoisted daily.—S. F. Mount shipped a carload of silver-lead ore from Fillmore.

Tintic Miner: It is reasonably certain that the Centennial-Eureka mine will build a mill for the reduction of the low-grade ore uncovered the last few years. The company is in good condition financially, having been hoisting 400 tons of ore a month for some time past that has paid a good margin.

Mercur Mercury: Figures on the output of the district show an increase in the amount of ore treated and the amount of dividends paid. In the past six months the mines of Mercur have paid dividends aggregating \$256,000. The amount paid during the corresponding period of last year amounted to \$165,000. In the past six months the shipments of cyanides have aggregated about \$600,000, as against \$360,000

for the same period last year.—The Horn Silver, Frisco, shipped six cars of crude ore.—Shipments from Tintic last week were forty-four cars of ore, eight of concentrates and seven bars of bullion.—The Washington at Frisco made its first shipment of concentrates amounting to forty tons.—The Midas mine, Deep creek, owned by Jno. Derrn and associates, will build a mill, and cyaniding will be begun this season.

IDAHO.

H. A. Keyms has been inspecting the properties of the Green Creek M. Co., near Harper. If his report is favorable, a mill will be erected upon the property. W. H. V. Richards is Mgr. of the mine.—The Cumberland mine at Silver City employs seventeen men. The mill is running on custom ore.—The Black Cloud concentrator, near Wallace, is nearly completed. It will be ready to run some time this month.—Work on the General Custer, near Wallace, is being done for the Kansas City Smelting Co., the secretary of which holds a bond on it. The plan is to run a tunnel 1200 feet long, which will cut the ore about 400 feet below the No. 2 tunnel. It is contemplated to put in a bucket line from its mouth to the level of East Nine Mile, one-third of a mile distant, and build a narrow-gauge road from there to the mill, two and one-half miles down the creek.

MONTANA.

The concentrator on the Park mine, near Elkhorn, has started on silver-lead ore with a daily capacity of four tons. The ore carries some gold and copper.—Work will be resumed within sixty days on the Kennett mine near Madison. The shaft will be sunk 200 feet deeper and a railroad built from the mine to the mill.—Water at the Leiter mine, at Twin Bridges, is interfering with operations this season more than ever before. The pumps have been inadequate to keep the levels clear, and recently the pump on the lower level was lost, and operations have ceased for the present.—Two carloads of concentrates from the Snowshoe, at Libby, were shipped to Great Falls last week.

At Clancy the Overland mine is making a weekly output of 100 tons. Some of the ore smelted nets about \$1400 per carload, or \$70 per ton, gold. The mill is run on second-class rock exclusively.—McAssey & Co. have taken a lease on the London mine near Neihart. The shoot of sulphide ore in this mine is about 800 feet long and in some places 9 feet wide. Much of it appears to be of low silver value.

The Anaconda mine is averaging a daily output of 500 tons.

The south drift of the 500-foot crosscut tunnel of the Keystone at Sylvanite is in nearly 100 feet on the lead and shows the best ore found in the mine. About 12 feet of the vein is exposed. The ore is of superior quality.

Lee & Co. have bonded their mine near Twin Bridges, to Wright & Hayes for \$30,000.

The Whitehall Zephyr says that Armour & Baker shipped a carload of ore from their mine at Waterloo that will net \$500 a ton.

Thompson & Oleson have begun work on the North Boulder mine, near Bernice.

At the Tiger-Poorman mine from June 1, 1897, to June 1, 1898, there were 113,607 tons of crude ore mined, producing 16,628 tons of shipping ore. The mine made a profit of \$64,604.46 during the year.

It is reported that the Hope mine at Basin will resume. They will sink the shaft to the 600-level and put in additional concentrating machinery sufficient to handle the mine on a large scale. The Hope has produced \$600,000 to the 300-foot level.—Work has been resumed on the McCauley M. & M. properties at Crevasse. The property was recently secured by J. Work and associates of Livingston. They will work on an extensive scale. A force is at work developing the several leads. There are two 10-stamp mills on the property which will be started at an early date.—Elkhorn is showing activity. The old Elkhorn mine is employing 175 men.

Basin Progress: The last car of ore shipped from the Ruby mine netted \$4000.

Independent: The Kennett mine in Madison county remains closed with no definite assurance of being opened, although it is rumored that after building a tramway for transmitting the ore from the mine to the mill, the company will again resume operations.—The old mill at Sterling has been converted into a cyanide plant and is running from seven to ten tons of ore per day.

SOUTH DAKOTA.

Work at the Gilt Edge mine, near Deadwood, is progressing. There are five teams hauling ore to the smelter. The ore is good grade and is netting the company close to \$1200 per day.—The Great Northern shaft at Two Bit has reached a depth of 200 feet. The Chicago and Two Bit shaft is down 340 feet.

WYOMING.

At Grand Encampment Mr. Cox has been throwing an iron-looker ore over the dump. Recently it occurred to him to have a sample of it assayed, and he found that it ran \$370 in gold. He is now carefully going over the dump and sacking the ore. The streak is 6 inches wide.

Development work on the gold and silver deposits at Sunlight basin, in the northern part of Big Horn county, is being pushed, backed by Montana and Eastern capital.—It is said that the Centennial lead, near Laramie, has been rediscovered by W. Barker and two other prospectors. The Centennial lead was discovered years ago, and proved to be rich. Before any development had been done, however, it was lost, and has been an object of diligent search ever since.—J. H. Lezeart will develop his uranium property at Evanston. The ledge is reported to be from 9 inches to 3 feet wide, the tests showing from 8 to 28 per cent uranium.

MINNESOTA.

Minnesota now comes to the front as a producer of iron. Her total shipment of iron ore

during the season of 1897 amounted to 5,552,161 tons, an increase over the previous year of 1,588,992 tons.

COLORADO.

BOULDER COUNTY.

In the Camara mine, in Ward district, the pay streak has increased to 9 inches of peacock iron. The lead has been carrying ore running from \$40 to \$280 in gold per ton.—In the Old Sol, a body of shipping ore has been opened.—The Franklin at Wall Street is taking out twenty tons of ore a day.—Ewing & Brannon have given a two years lease to A. Gregg Sr., at Ward, on the Success group for \$12,000. He will put a steam plant on the property, a boiler, air compressor and drills.

EL PASO COUNTY.

The Gold Coin M. & L. Co. sold to D. F. Richardson the Jefferson Lode mining claim in Victor, for \$18,500.—Eight tons of ore running from one and one-half to two ounces, were shipped from the Scott sublease of the Specimen property, Cripple Creek.—Fifty-two tons of ore were shipped from the Pharmacist mine, thirty-two tons of which gave an average value of an ounce and a half and twenty tons yielded five ounces per ton.—The lessees on the Morse group are making regular shipments. The best grade of ore is being mined on the Colorado City. The last shipment averaged \$145.60 per ton.—A strike of 2 feet of sylvanite ore that runs from twenty-five to thirty-five ounces is reported from the Burbridge lease on the Christmas.

Investor: A good strike has been made in the Baltimore lease on the Vindicator, where a vein 5 feet wide of \$40 ore was encountered. A trial shipment of 20 tons showed an average value of \$38.

GILPIN COUNTY.

Lessees of Champion mine, Bellevue mountain, while working in the 420-foot level, struck a body of ore 24 inches wide. A shipment of the smelting ore gave \$100 in gold per ton and the milling ore ran \$17. The shaft is down 900 feet and several levels have been run.—A number of leasers are developing properties in the Quartz Hill district, and keeping up steady shipments of milling ore and some smelting ore. The mill ore plates \$5 to \$10 in gold per ton.—The Gold Chollar mine in Frosser gulch, is shipping smelting ore that runs \$75 per ton, and milling ore that yields \$20. The ore treated last came from the 200 and 270-foot levels. At less depth the smelting ore was worth \$43 per ton.

GUNNISON COUNTY.

On the Burke claim, Mineral Point, a vein over 200 feet in length shows a varying width from 6 to 15 feet, that carries values in lead carbonates and copper. A tunnel is in over 100 feet on the vein.

HINSDALE COUNTY.

Boston capital is making an examination of the mineral resources in Hinsdale county with a view of erecting a custom mill at Lake City.

LAKE COUNTY.

The Hill Top mine of Leadville recently reduced their force as the ore bodies that had been opened were nearly exhausted. Development work was continued and the property is opening up larger bodies of ore than they had before and averages better than shipments from the old ore bodies. Seventy men will soon be taking out ore.

The property on Long and Derry hill, that has been prospecting by the Preston Company, has furnished ore which carries thirty ounces silver, 15 per cent lead and small values in gold. The company will crowd work.

The importance of the strike in the Mab mine, Leadville, is becoming more apparent. From the 1000-foot level the drift ran 600 feet in constantly enlarging stringers and opened into a large body of ore which is pronounced the Mahala chute.

LA PLATA COUNTY.

The Tenderfoot mine, in East Mancos district has three shafts in which the vein shows 24 inches wide. The free milling ore gives a net profit of \$5 per ton.

SAN JUAN COUNTY.

The San Juan M. Co. has begun shipments from their property near Silverton. The first car gives 56.87 ounces silver, lead not reported; two carloads are at the smelter.—The Toltec group of claims, in Picayune gulch is being put in shape for extensive development. The ore carries 60 per cent lead and eighteen ounces silver per ton.

SAN MIGUEL COUNTY.

About 400 ounces of gold reefs were shipped last week from the Shoemaker group of mines at Ophir.

SAGUACHE COUNTY.

Since January the ore shipments from Creede district have been 48,705 tons, having an aggregate value of \$1,719,286.50. The shipments were from four mines, the Chance, Amethyst, Commodore and Ridge. There are 600 miners earning \$1800 per day.

NEW MEXICO.

The Santa Rita copper mines at Santa Rita have 150 men employed, most of them working under the tribute system, every one making good wages, besides profits for the company.

ARIZONA.

At Prescott on the 13th a mining suit of interest was decided by a Territorial court. In '92 H. H. Warner contracted with Wells & Lawler for the purchase of the Hillside mine for \$500,000, paying over \$200,000. Warner stocked the mine under the name of the Seven Stars Mining Co. for \$3,000,000, selling stock in the Eastern States and Europe and giving a personal guarantee that the mine would pay 15 per cent a year dividend. He failed and the Seven Stars Mining Co. collapsed with him. Wells & Lawler offered a complete sale and to give a deed on receipt of the balance agreed upon, although the conditions of Warner's contract provided for the

forfeiture of all money paid and all improvements placed on the property if final payment was not made in a stipulated time, long since past. The stockholders brought suit against Wells & Lawler for the recovery of money paid for stock of the Seven Stars Mining Co. and judgment has just been rendered in favor of the plaintiffs for \$180,000, to act as a lien against the mine until paid. The case will be appealed to the Supreme Court of the Territory and probably to the Supreme Court of the United States.

The King of Arizona mine at Mohawk has introduced the MacArthur-Forrest cyanide process.—Two carloads of ore from the Blue Jay mine, near Tucson, netted \$1200.—The Dave Denver Co. bought the Old Shelton group of mines at Big Bug for \$40,000.

The railroad to the Old Dominion mine at Globe is completed to the Gila river, twenty-six miles from Globe, and trains are in operation to that point.

There are 110 men employed in development work in the Buttes mines, near Saginaw.—J. Potter, associated with Salt Lake capitalists, has bonded a group of claims at Dos Cabezas and will begin development without delay.

A. F. Penrose has bought the Juniper mines in Cochise county for \$75,000.—Gibson & Bartleson are opening up Las Amarrillas, near Nogales, and will soon have ore enough out to start up their mill. The mine has a large body of gold ore that will average \$15 per ton, and the mill has a capacity of twenty tons a day. There are twenty men at work. The cyanide company that worked 400 tons of tailings from this mine realized \$12 a ton from them.

Phoenix Republican: A body of copper has been discovered in Park county, near Fairplay. It is reported to run 8 per cent copper and a little gold and silver.

Yuma Sun: A trial run of 100 tons of ore from the Sheep Trail mine, in Mohave county, is being made.—Place & Overton have begun the development of the Overlook mine, near Prescott.—By development of the Elkhart mine, in Mohave county, water has been struck sufficient to run the concentrator ten hours per day, during which time half a carload of concentrates is turned out. It is proposed to sink the shaft 500 feet.—J. T. Dongine of Chicago has bought the Sultan group of mines in Santa Maria district, Yavapai county.

LOWER CALIFORNIA.

Surveys are completed for a ditch and pipe line on the Buena Vista placer mines, near Escondido. Operations are to begin shortly.

The Californian says that H. Cannon of the San Jose mines will leave for San Francisco to purchase a mill for the property.—The Socorro placers, after two months' sluicing, are making a clean-up.

Californian: Work on the Aurora and Moccutezuma mines near Alamo will be resumed immediately. The Moccutezuma has a good body of ore, while the Aurora is one of promise. The Viznaga mine at Mexican gulch, a property on which Harrison & Godbe have obtained an option, will begin work. While operations at the Viznaga mine have never entirely ceased, a change in the character of the ore, combined with other features which make greater development necessary, has somewhat retarded work. They will sink the main shaft to greater depth and continue the drifts. The Trinidad M. Co., owning the Trinidad group in the Jacalitos district, which includes the Piedra mine, contemplates beginning extensive development within a fortnight.

MEXICO.

Craaz Bros. have bought a group of mines near Alamos, Sonora, and propose building a 10-stamp mill. The ore carries gold and silver.

The El Plomo M. Co., near Cerro Colorado, Sonora, is working the Colorado, Plomo and Blanca mines and also has a lease on El Tirol mine. The ore is hauled seven miles and worked with a profit. It runs \$20 a ton on the 200-foot level and the lead is from 2 to 4 feet wide. The mill is run in connection with the cyanide plant. It has a capacity of forty tons daily.

The Las Animas mine near Puerto, Sonora, has been bought by Los Angeles men, who will begin working the property. B. Salazar of Los Angeles will be Gen. Mgr.

Two Republics: According to W. E. Emmons, its president, a company organized by Detroit and Milwaukee capitalists under the name of the Detroit and Mexican Smelting & Refining Co. has bought for \$100,000 the mining properties at Sultepec, owned by A. Blanco. The company will work the property on a large scale. A smelter to cost \$100,000 is to be erected and to be connected with the mine by a ropeway, about two and one-half miles in length.

Oasis: At Nacosari the Copper Queen Co. are pushing work at their reduction works, about six miles from the mine. The mine has on the 500-foot level a ledge 185 feet wide in its narrowest part, all in good ore. Seven hundred feet below this tunnel, 8000 feet long, follows the vein and a railway from the reduction works, six miles away, will traverse this tunnel, taking ore to the smelters.

RUSSIA.

United States Consul Smith at Moscow reports that a telegram from Tomska announces the finding of a gold nugget weighing seventy-five pounds in the Spasso Preobrajensk mines, situated on the river Chibkey, in the district of Yeansay. The nugget, says the consul, will be found to take the eleventh place, as far as size is concerned, among the nuggets of the world, and the second among those found in Russia. The first was found in the South Ural mountains.

SOUTH AFRICA.

The use of candles by the mining companies is very large. In 1896 there were used by eighty-one companies 119,135 cases, value \$382,630. The imports for the first four months of 1897 amounted in value to \$232,765.

Union Iron Works,

222 MARKET STREET.

SAN FRANCISCO, CAL.

This

Three-Stamp

Iron Frame Battery

WAS MADE BY THE

UNION IRON WORKS

FOR THE

NEVADA METALLURGICAL WORKS.

The stamps weigh 350 lbs.

The total weight of the battery is 5000 lbs.

The weight of the heaviest piece is 1300 lbs.

Capacity, five tons per day.

Whatever is popular deserves attention.—Thackeray.

Unquestionably the Most Popular Friction Hoist in the Market is the

Bolthoff Lightning Quadruple Friction Hoist.

Requires less power to apply and gives better contact for friction surfaces than the double friction types. By carrying the brake band between the frictions the strain is reduced to a minimum.

COMPLETE HOISTING OUTFITS CARRIED IN STOCK.

Hendrie & Bolthoff M'f'g and Supply Co.,

1601-1615 SEVENTEENTH STREET, DENVER, COLORADO.

10 x 12 LIGHTNING QUADRUPLE FRICTION HOIST.

W. H. BIRCH & CO.,

REMEMBER! THE STATE FAIR

WILL BE HELD AT SACRAMENTO,

SEPTEMBER 5th TO 17th, 1898.

This Annual Exhibition Covers a Broad Field and Brings Together People That Have Many Interests.

THE INDUSTRIAL DISPLAY Made each year in the commodious Pavilion embraces a most general assortment of the artisan's work.

NEW DEVICES IN MINING Machinery can be shown here to an advantage, as the extensive mining region contiguous to Sacramento makes it easy of access, for those interested in this character of exhibits.

PRACTICAL PUMPING PLANTS Are needed in many sections of the State, and those interested are viewers of these displays.

MODERN MECHANISM Of every character is placed on exhibition at the State Fair in order to take advantage of the great crowds drawn hither by the various attractions.

THE AGRICULTURIST and general farmer makes it a point to examine, not only the improved breeds of Live Stock that form an important feature of the Fair, but all improvements in machinery and labor-saving appliances.

THE MERCHANTS of the interior of the State, the genuine distributor of wares of every description, attends the State Fair, to note the progress in all lines of trade.

THE MANUFACTURERS and their representatives cannot afford to ignore the Annual State Fair as a medium to advertise their output of goods and wares.

REMEMBER THE DATES.

Exhibits Carried free by the Southern Pacific Railroad Co.

HAVE REMOVED
THEIR

Machine Works
TO 183-185-187 FREMONT STREET,

Where, with Enlarged and Increased Facilities, they are better than ever prepared to do

First-Class Machine Work

Promptly, and at Reasonable Prices, and will continue the manufacture of

Thomson & Evans Steam Pumps,

Deep Well Pumps, Power Pumps, Etc.,
Also Marine Engines, Ship and Steamboat Work,
Pipe Cutting, General Jobbing and Repairing.

FRASER & CHALMERS, 155 Fulton St., Chicago, Ill.

We manufacture the best Perforated Metal Goods, and quote the lowest prices on Mining Screens, Trommels, etc. It will pay you to order from us.

MINING MACHINERY.

Be Sure You Get
THE GENUINE FRUE
VANNER.

SUPERIOR TO ALL IMITATIONS.

You do not know what is best in
CRUSHERS unless you have used our
Comet Adjustable.

It is easily in advance of other gyratories, which lack its range of adjustment for wear and change in size of product. Our new heavy design is also superior in proportions to that of any competing machine. Its good qualities are evidenced by largely increased sales and expressions of satisfaction from customers.

All patent claims by other parties affecting the Comet Crusher have been put to rest by the final decision of the highest courts.

PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

WILFLEY CONCENTRATOR.

PRICE \$450 F. O. B. SAN FRANCISCO.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work.
SEND FOR CIRCULARS.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

Market Reports.

The Markets.

SAN FRANCISCO, July 14, 1898.

SILVER.—London, 27½d; New York, 59½; San Francisco, 59½, nominal; Mexican dollars, 45.

COPPER.—Lake, 11¼@11½; quiet and unchanged.

LEAD.—Firm. New York quotes 4.02½ asked; smelters quote 3.80; local, pipe, 6@6½; sheet, 6½@7c; pig, 5½c.

IRON.—American, soft, \$20 and \$22 per ton.

SPELTER.—5 and 5½.

TIN.—Menlo Roofing, redipped, \$7; English, to arrive, \$4.50; Pig, 18c.

ANTIMONY.—9½, 10.

BABBITT METAL.—16c.

NAILS.—List per keg: No. 20 to 60d, wire, \$2.25; cut, \$2.00; 10 to 20d, wire, \$2.30; cut, \$2.05; 8d, wire, \$2.35; cut, \$2.10; 6 and 7d, wire, \$2.45; cut, \$2.20; 4 and 5d, wire, \$2.55; cut, \$2.30; 3d, wire, \$2.70; cut, \$2.45; 2d, wire, \$2.95; cut, \$2.70. In carload lots, 10c per keg less.

QUICKSILVER.—Domestic, \$42.50@43; export, special rates. Foreign advices say that the output of the Rothschilds' quicksilver mines in Spain, which produce a little less than two-thirds of the total production of the metal, is at present running behind normal figures; complications with the United States are stated to be without noticeable effect. California quicksilver ore is now running about 1½.

POWDER.—F. O. B., San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1* 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 725 kegs, \$1.50 per keg; less car lots, \$2 per keg.

FUSE.—Triple tape, \$5.10 per 1000 feet; double tape, \$4.35; single tape, \$3.45; Hemp, \$3; Cement No. 2, \$4.35; Cement No. 1, \$3.45.

CAPS.—8x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9.

COAL.—San Francisco coast, yard prices: Wellington, \$8 00 Coos Bay, \$5 00 Seattle, \$6 00 Southfield, \$7 50

Cargo lots, Eastern and foreign: Wallend, \$7 50 Cumberland, \$10 25 Brynbo, \$7 50 Canine, \$10 00 Pennsylvania, \$14 00 Welsh Anthracite, \$12 50 Scotch, \$8 00 Rock Springs, \$7 60

COKE.—Foreign, \$13; domestic, \$11 per ton.

CHEMICALS.—Cyanide of potassium is quoted jobbing, 32@33c per lb.; carloads, 29c; sulphuric acid, 2½c per lb. for 60%; nitric acid, 12½c; soda ash, \$1.60 per 100 lbs. 58%; hyposulphite of soda, 2½c per lb.; blue vitriol, 4½c per lb.; borax, refined, 50c per lb.; chloride of potash, 9½@10c; roll sulphur, 2½c.

LUMBER.—Retail: Pine, ordinary sizes, \$17@18.50; redwood, No. 1, \$18@20; No. 2, \$16@18.

As the trustee of civilization, the United States is at present quelling barbaric savagery in the East and West Indies and acquiring dominion in the Pacific. This costs life and treasure. Some are doing the fighting; those of us who stay at home can at least aid by paying our share of the tax; technical evasion is not patriotic.

Mining Share Market.

SAN FRANCISCO, July 14, 1898.

When to the untoward condition of the Comstock is added the "face" value clause requirements of the war tax, it is little wonder that the San Francisco stock market is at present lifeless. This matter was discussed at length in last week's issue, and considerable of value not published elsewhere given. Since then nothing of additional interest has transpired. All the official rulings on the bill so far as mining stocks are concerned are confirmatory of what appeared herein on the 9th inst.

Regarding the question asked, "Where shall stamps be placed on transfers of mining stock, on the new certificate, the cancelled certificate, the memorandum of sale, or the books of the company?" the Commissioner of Internal Revenue decides that when the transfer is endorsed on the back of the original certificate the stamp should be placed on the endorsement. When a memorandum of sale only is made the stamp may be affixed to that, and the memorandum attached to the original certificate. When no such evidence of sale exists, then the stamp must be placed on the company's books.

The Commissioner of Internal Revenue's ruling that the full amount of tax on a transfer of 100 shares of stock of a less par value than \$100 per share is \$2, or the same as on stock of \$100 per share par valuation, is questioned. A telegram to Secretary of the Treasury Gage, asking him what the tax would be on a certificate of stock of the par value of \$1 per share, has not yet been answered, and has, probably, been referred to the Attorney-General. As it now stands the law will secure no revenue for the Government, as it practically destroys the business relied upon to produce revenue in the case of low-priced mining stocks, which, evidently, was not the intention of the framers of the bill.

Commercial Paragraphs.

THE Transcript says C. R. Loyd paid \$20,000 for the San Bernardino, Cal., Gas Company's plant and now controls the entire lighting system of that town. It also hears that Mr. Loyd intends selling the electric plants of the city to the Southern California Power Company of Redlands.

Mrs. MIDDLEBROOK of Denver, of the Jeanesville Iron Works Co., writes that the Denver office is removed to 1328 Seventeenth street. He now has a stock of Cameron pattern sinkers and duplex station pumps. The shops are building one 24 and 42x16x45-inch stroke compound condensing and several smaller ones.

THE California State Fair of '98 will be held at Sacramento from September 5th to 17th, inclusive. The industrial display will be of commercial interest. Manufacturers will find this central point a good place for exhibition. Mining machinery and irrigation plants, pumps, etc., are in general demand, and those who attend are usually of a class who have money to spend. The railroad company will carry all exhibits free. Mr. Edwin F. Smith, the secretary at Sacramento, will furnish full information to any one contemplating placing an exhibit therein.

THE Pelton Water Wheel Co. of San Francisco have under construction a power plant for the British Columbia Railway Co. at Gold Stream, twelve miles from Victoria. The water supply is furnished from the Esquimalt Water Works. The plant consists of two 35-inch D. N. Pelton wheels, 600 H. P. each, running at 600 revs., under 500-foot head. The wheels are direct connected by insulated couplings. The power is to be submitted to Victoria at a pressure of 10,000 volts, and used for running the railway system of that city, lighting and general power purposes.

FRANCIS SMITH & Co., the pioneer manufacturers of riveted steel pipe in this State, are putting up the most extensive plant in their line on the Pacific coast. The new building covers a ground space of 275 feet square and is located on Townsend street between Seventh and Eighth. Being close to the main line of the Southern Pacific (coast division), sidetrack facilities will be ample and convenient. The new establishment will be equipped with the latest improved machinery adapted to the heaviest kind of work, and will be ready for occupation August 1st. The down-town office will be at No. 46 Fremont street, San Francisco.

TO MINING INVESTORS.

The Advertiser holds the Controlling Interest in the Capital Stock of a

Developed, Patented Mine on the Mother Lode

IN AMADOR COUNTY,

In the immediate vicinity of the most productive mines of the district.

Mine Well Equipped with Hoisting Works, Necessary Buildings, Machinery, Tools, Etc.

THREE-COMPARTMENT SHAFT, 1150 FEET DEEP, with large bodies of free-milling ore exposed upon different levels.

The ore is of fair average value, sufficient to yield a good profit, with high-grade ore in the bottom of shaft.

IT IS DESIRED TO FORM A COMBINATION with a responsible party for the legitimate operation of the mine.

Amount of Cash Required Will Probably be from \$5000 to \$8000, payable in easy installments, to be refunded with interest from first dividends.

Money to be applied to the development of the property, security furnished therefor, to be repaid should future developments not meet expectations of the investor.

A Satisfactory Party Can Secure One-Fourth Interest in the Property upon terms which will in the near future practically give the interest at little or no cost.

Address, appointing interview: P. O. BOX 87, OAKLAND, CAL.

Mines or prospects operated on contract to purchase, or under lease on fixed royalty or percentage.

Assessment Notices.

CONS. ST. GOTHARD GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 9th day of June, 1898, an assessment (No. 14) of 5 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 113 Crocker building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 23d day of July, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 18th day of August, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. F. HOLLING, Secretary.

Office—113 Crocker building, San Francisco, Cal.

MARGUERITE GOLD MINING AND MILLING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Auburn, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 20th day of June, 1898, an assessment (No. 10) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 237 12th street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 4th day of August, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 3d day of September, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

F. METTMAN, Secretary.

Office—237 12th street, San Francisco, California.

The Secretary will also receive payments from 12 to 5 P. M. at his business office, 225 Sansome street.

RED CAP MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Red Cap Creek, Humboldt County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 29th day of June, 1898, an assessment (No. 4) of Two Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, room 14, Nevada block, 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 1st day of August, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 29th day of August, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

WILLIAM McPHERSON, Secretary.

Office—Room 14, Nevada block, No. 309 Montgomery street, San Francisco, California.

GOULD & CURRY SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 7th day of July, 1898, an assessment (No. 84) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, room 60, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of August, 1898, shall be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 29th day of August, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

AUBREY K. DUBROW, Secretary.

Office—Room 60, Nevada block, No. 309 Montgomery street, San Francisco, California.

THORPE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Fourth Crossing, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 10th day of June, 1898, an assessment (No. 10) of 2 1/2 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, Room 44, Phelan building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 18th day of July, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 8th day of August, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. F. PREY, Secretary.

Office—Room 44, Phelan building, San Francisco, California.

FOUR and SIX-FOOT FRUE VANNERS

With Brownell "Patent Lip" Flange Belts.

STANDARD MACHINE OF THE WORLD.

When a Concentrator like the Frue Vanner has been on the market nearly two decades, and the sales have constantly increased, it is safe to say it is the "Standard Machine of the World." More Frue Vanners have been sold during the last twelve months than for the same period at any time during the history of the machine. Practical mining men in all parts of the world where mining is carried on will testify as to its merits. It is the "standard" which all competitors are trying to imitate.

The results obtained by this machine are the "acme" of concentration, and several cheap and untried machines that have lately come on the market compare by it. The manufacturers will tell you that they are "just as good, and cheaper," etc. The facts are that no other concentrator made has an equal capacity, or will yield as clean a concentrate with as small loss in the tailings as the Frue Vanner. The amount saved from the lower first cost of an inferior machine counts little in the year's results, when compared with the increased output from a Frue. This machine not only gives better results at both ends of the belt (i. e., clean product and poor tailings), but is operated at less expense and requires less attention than any other machine on the market. At the Alaska-Treadwell mine, where they have ordered over 350 Frue Vanners, one man attends 48 machines for 12-hour shift.

New Style Gates Crusher.

In the issue of June 18th appeared an illustrated description of the plant at the new Golden Gate mill, Mercur, Utah. Mention was made therein of the Gates crushers. The crushing department of the mill consists of two No. 6 crushers, three sets Gates rolls 36"x16" and four sets Gates rolls 26"x16". The guaranteed capacity was 500 tons per day, but according to General Manager Cohen the crushing installation will handle nearly 2000 tons daily, so that in their crushing department they are ahead of the other departments of the mill. Through one set of 36" rolls they passed 300 tons in twenty-four hours, crushing it from 1½" to ¼" or less. Much of the ore is crushed down to 20 or 30-mesh.

Herewith the "H style fine crusher" is illustrated. This is designed and built for fine crushing and to take the place of roughing rolls. It is calculated to take material that has passed an ordinary gyratory breaker or jaw crusher—3" ring size—reducing it so that 90% will go through a ½" screen. With a view to economical wear of the head and concaves, a removable ring is used for holding the concaves (which are but 7" long), admitting of being reversed. The use of a top shell is dispensed with, the spider being directly bolted to the lower shell or frame, the concave ring being enclosed within the two parts and held by clamping those parts on the ring with bolts on the side. The discharge diaphragm is independent of the frame and while in place can be shifted so as to discharge in front or either side.

In a flat diaphragm near the lower end of the bottom shell is journaled the upper end of the eccentric box, the space forming an oil chamber and containing the bevel gear and the pinion which rotates it. Continuous oiling of the eccentric and main shaft journal is effected by utilizing the force of the oil flung from the teeth of the pinion, a part being carried above the top of the eccentric, there discharging into the cup formed by the inside up-raising flange of the dust and water seal, thence returning to the oil chamber through the journal of the eccentric and main shaft and by other passages. Fastened to the gyrating shaft and turning with it is the seal above mentioned, a downwardly projecting flange, and, whether the machine is being used for wet or dry crushing, protecting the oil chamber and actuating mechanism below the diaphragm from possibility of damage.

NEW STYLE GATES CRUSHER.

The Brown Bear Mine, Deadwood, Cal.

At Deadwood, Trinity Co., Cal., is the Brown Bear quartz mine, an illustration of which is given below, with a record of \$6,000,000, most of which was taken from two parallel ledges on the Last Chance and Monte Cristo claims. There are twelve miles of tunnels, drifts and crosscuts; the greatest depth is 600 feet on an incline. A noticeable feature of the ore is that it is either very rich or not worth milling, there being practically no "average rock." Since prospecting below the mill level cut off the water supply from above, Supt. Dobler put in a Dow triplex pump, transmitting power from the mill 850 feet by wire rope traveling 1200 feet per minute, and pumping 5 inches of water per minute, raised 175 feet. About forty-five men are constantly employed.

It is interesting to note from official reports that for the first time in American history our exports of manufactured articles now exceed our imports of manufactures. During the twenty business days of last May were sent abroad American manufactured goods to the value of \$27,000,000; during the same time \$18,000,000 worth of foreign manufactures were brought in. This exportation of 50 per cent more than importation, and that, too, in the existence of a foreign war, is striking illustration of our prosperous trade conditions.

AMONG the 20,000 U. S. soldiers arriving in San Francisco during the last ninety days is a battalion of volunteer engineers, now encamped at the Presidio, a 1500-acre Government reservation on the northwestern ocean line of San Francisco. Two regiments of volunteer engineers have enlisted, the men being mostly electrical, civil, mining and steam engineers, master machinists, etc. Among them are many of the regular engineer corps, U. S. A. The four companies now here were recruited in San Francisco, Portland, Or., Salt Lake City, Utah, and Denver, Colo. Scattered through the other regiments is a considerable percentage of engineers, but the two regiments referred to are wholly made up of such skilled recruits.

IN marked contrast to the dullness in some branches of industry, the activity in mining is shown by the continual incorporation of new mining companies—an average of ten a day being noted in the various gold mining States and Territories of this west half of America.

In accordance with recent editorial suggestion herein the twenty-fifth anniversary of the building of the first cable road in the world, the Clay-street line of San Francisco, is to be suitably recognized, the supervisors agreeing to set aside space in Portsmouth square, the former terminus of the first cable road, for a monument. The design is to be submitted by the directors of the Mechanics' Institute, which offers the Institute bronze medal for the best design. Competition will be open to all artists.

Few things ever got more or better deserved notice than the battleship Oregon is now receiving. All round the world our contemporaries are commenting upon the great vessel built in San Francisco and largely manned by Pacific coast residents. Her 14,000-mile trip around the Horn, in readiness for active service the day afterward, was a wonder; then her efficiency as a fighter in the Santiago affair, and, lastly, her ability as a swift-going vessel to overhaul the Spanish warship Colon, have aroused enthusiastic admiration of naval engineers everywhere. As an all-round sea going fighting racer the Oregon is in the van. Not since that day in March, 1862, when the Monitor and Merrimac met, has any vessel made such a record in naval history.

In his address as president of the International Mining Congress at Salt Lake, L. B. Prince referred to the organization having changed its name, having been called together at Denver a year ago as the Gold Mining Convention. He said: "I doubt if all appreciate what an enlargement that was, and how vast is the interest now represented. As a gold mining convention it represented only the \$55,000,000 or \$60,000,000 of annual output of that one metal, but now it stands for a yearly product more than twelve times as great, exceeding \$750,000,000 and embracing every form of mineral wealth. There are the ten great commercial metals, among which iron is by far of the largest value, and the wide variety of other products, where coal stands pre-eminent, with an annual value almost four times that of gold."

An article by an Australian geologist, B. J. Skertchley, succinctly shows how scant is the distribution of tin ore. While the known gold fields of the world cover more than 1,500,000 square miles, the tin fields have an area of less than 12,500 square miles. There are seven tin districts in Europe, producing about 8300 tons yearly, of which the Cornish mines yield about 8000 tons. Asia has two tin areas—Hunan, in China, estimated to produce 2500 tons, and the Straits Settlements and adjacent principalities, yielding 58,000 tons yearly, the richest yield in the world. Africa has no known tin mine; North America no payable mine, though South Dakota and California have made some efforts in that direction; South America one limited tin area—Bolivia and Peru—yielding less than 4000 tons a year, and Australasia, the youngest, furnishing about 6000 tons a year.

Mining Incorporations, Stock Sales, Etc.

The business of the issue, sale and transfer of mining stock, which the first rigid ruling of the revenue collector threatened with extinction, can go on, a more favorable and just construction of the law having been authoritatively secured. The first arbitrary ruling meant prohibition of nearly all business in ordinary mining corporation stock, and, amid a storm of protest, Commissioner of Internal Revenue Scott has reversed his original rulings thereon. The question for existing mining incorporations is now mainly whether to reincorporate with par values diminished, or to reduce the present nominal capital stock and the par value of shares. The California Civil Code limits the amount of any one assessment to 10% of the capital stock after one-fourth has been subscribed. In accordance therewith, special meetings of several of the Comstock companies have been called for September next to act upon a kindred proposition; for instance: the Con. Cal. & Virginia M. Co. will hold a special meeting of stockholders on Sept. 21st, to act upon a proposition to diminish the capital stock from \$21,600,000, divided into 216,000 shares of the par value of \$100 each, to \$540,000, divided into 216,000 shares of the par value of \$2.50 each.

In other States, in the incorporation of new mining corporations, the effect of the new war revenue is equally apparent. In Spokane, Wash., was incorporated this week the Hecla Mining Co., "capital stock \$250,000, divided into 1,000,000 shares," making the par value 25 cents per share; other companies are incorporating there, "par value 5 cents per share." In Salt Lake City, Utah, this week, was incorporated the R. G. W. M. Co., "capital stock \$20,000, divided into 20,000 shares, par value 10 cents per share."

In connection with this may be cited such decisions as that of the Supreme Court of Montana in the case of Kelly vs. the Fourth of July Mining Co., previously noted herein, which equally with the war tax will tend to discourage the tendency to capitalize in excess of the true value of the property owned, and, in that way, good may result.

It has been the custom in capitalizing a new mining company to put a fictitious value on the property; a company owning property worth \$50,000, would be capitalized for \$500,000, with no intent to deceive, or work fraud, but merely because of custom, the market price being without reference to par value, which now becomes of such present importance. The Montana decision was to the effect that the owners of stock in an over-capitalized company were liable for the difference between the real value of the property and the total capitalization.

ABOUT nine miles steel pipe, from 15" to 26" diameter, are being made at Adelaide, West Australia, after a new design, rivetless, longitudinal joint. Each section is 26 feet long, with but four pieces, two locking bars and two plates. Each plate is cut with square ends, after passing through a tram of leveling rollers, after which a planer with four cutters on a sliding table cuts the two longitudinal edges parallel, and sixteen rollers—eight on each side—carried by the bending rolls, upset the edges in a dove-tail of uniform width and depth. Thence the plate goes through a hydraulic press which upturns the edges, after which it passes through rolls which bend it into a half-circle, two of which are placed in grooves in locking bars and temporarily clamped together. The pipe is next subjected to hydraulic pressure of fifty tons per inch on an expanding mandrel, the grooves closed and the usual asphalt coating applied. The pipe is jointed in the trenches with steel rings and lead, and is said to satisfactorily stand ordinary tests.

SECRETARY OF THE NAVY LONG has refused the recommendation of Chief Engineer Melville to fit up on this coast an engineer repair shop on a steamship similar to the Vulcan. He says that by the time the vessel was ready the war would be over. Possibly: yet economy and the surrounding circumstances justify Chief Melville's suggestion. Probably the Navy Secretary's chief reason was a desire to note the result of this new naval experiment in Atlantic waters. At an expense of about \$300,000 the steamer Chatham has been transformed at Boston,

Mass., into "a floating machine shop," and renamed Vulcan, as a tender to the fighting vessels, though not wholly defenceless, she carrying two rapid-fire 6-inch guns. In the bow is a stock room; aft are blacksmith shop, foundry and machine shop, respectively. The foundry is not a very elaborate one, but castings can be made on the boat. Of the crew of 200 a large percentage are skilled engineers and machinists. It is possible that later on a similar vessel will be put in operation here in front of the front door of the United States.

Liquid Air.

If one-half of what C. E. Tripler of New York declares as true is so, there is a new form of energy in the mining and industrial world more potent than steam, electricity or compressed air. Recently was published herein an account of Prof. T's exhibition of his process for producing liquid air. He now claims in published articles, with some semblance of fact, that liquid air is cheaply made and easily handled, and capable of being economically utilized in a variety of ways. He cites the fact that heat is an equivalent of force and that hitherto we have been able to utilize only the heat which rises considerably above the ordinary temperature of things. "The heat of coal, for instance, becomes effective in the steam engine only when the boiling point of water is reached; all that lies between this and the absolute zero—supposed to be about 460 degrees below zero, Fahrenheit—is wholly wasted. Thus, 90 per cent of the potential energy of the coal consumed, representing 672 degrees of temperature, is thrown away." But liquid air that boils and develops enormous pressure at a temperature 312 degrees below zero, enables us to utilize some of the waste. Confined in a properly constructed boiler, it acts precisely like steam, though with even greater energy, the difference being that no fire is needed to boil it. Its condition at 32 degrees Fahrenheit is like water at, say, 1500 degrees. One would not need fire to boil water if the whole earth were red-hot, as it is relatively to liquid air. It is entirely possible, in Mr. T's opinion, for a warship, furnished with his apparatus and equipped with suitable engines, to be driven indefinitely at the highest rate of speed which her construction enables her to endure, propelled by the heat of the waters that buoy her up exerted upon liquid air, making it as needed from the wind blowing over the decks by the use of apparatus which has waved satisfactorily in his laboratory experiments. This liquid air which boils and evaporates at 312 degrees below zero, Fahrenheit—524 degrees below the temperature of boiling water at sea level—represents in each cubic foot 800 cubic feet of ordinary atmospheric air, and, it is claimed, as it returns to its gaseous state, affords in such expansion energy capable of being economically directed in many of the arts of peace and war. A substance that would at once perform the function of blasting powder in a mine and at the same time purify the air and hoist the rock to the surface would be of manifest value to the miner, though many of Mr. T's conclusions seem chimerical.

THE amount of space given in the last six years in these columns to the cyanide process exemplifies the importance that mode of treatment is considered to be to the mining world. The fact that though an extra large number of copies of each issue is printed, when those "cyanide articles" appear, those particular issues are soon out of print, further evinces good grounds for such belief. In connection with this matter it may be said that in response to suggestions questioning the correctness of the item in last week's issue, that the De Lamar, Nevada, mill used 900 pounds of cyanide per day, the fact is as stated. The reason for such abnormal use is understood to be that, while ordinarily from one-quarter to one-half a pound per ton of ore treated is found sufficient, in the case cited the peculiar nature of the ore makes necessary the use of three pounds per ton. On the Rand, S. A., when cyanide was first used it was not uncommon to use three or four pounds per ton treated; the average consumption there now is .7 lb. per ton: the average extraction 76%. Regarding this matter of cyanide, it is noticed that considerable is being still said about the "secrecy" of the method

of cyaniding now in use at the new Golden Gate mill, Mercur, Utah. This paper believes that there is no great "secret" about it. Instead of using the ordinary leaching vat with zinc shavings accompanying, at the Golden Gate they precipitate the gold by the use of zinc dust.

Concentrates.

VIRGINIA, NEV., miners are going to Butte, Montana.

In the new camp of Republic, Wash., 350 men are employed in mining.

YAVAPAI COUNTY, ARIZ., has 259 stamps in operation in the various mines.

EIGHT mines at Mercur, Utah, have a monthly payroll aggregating \$50,000.

The Yellow Dog mine, near Yuma, Ariz., contemplates building a 20-stamp mill.

WITHIN a radius of fifty miles of Baker City, Oregon, 2000 men are working the mines.

The British American Corporation holds 290,000 of the 500,000 shares of the Le Roi, B. C., mine.

The Kemmerer, Wyoming, townsite has been sold to the Oregon Short Line Ry. for \$250,000.

It begins to look now as though the Klondike would yield almost as much gold in '98 as California.

In the Sterling mine, near Jacksonville, Or., a nugget was recently found that weighed sixteen ounces.

A cut from 25 to 20 cents per hour in wages has occasioned a strike at the Hall mines smelter, Nelson, B. C.

The Riata branch of the Mexican International railway is expected to be completed to Monterey Sept. 1st.

A PIPE 4 inches in diameter will, theoretically, carry four times as much water as one 2 inches in diameter.

"SLIMES" may be defined as that portion of crushed ore which, consisting of clay and sand, is not leachable.

The Arizona Copper Co. will add to its present reduction works two 150-ton concentrators and a new furnace.

The first steam quartz mill was built by Wm. Irvine, one and one-half miles north of El Dorado, Cal., in 1852.

In the forty mines at Rosland 1000 men are employed, the payroll aggregating \$100,000 a month, or \$1,200,000 a year.

The mines of Grand Encampment, Wyo., will furnish the reduction works 2250 tons of gold and copper ore per month.

A RELIABLE estimate places the number of British investors in B. C. mines at 15,000 and their investments at \$50,000,000.

ONE of the next necessary efforts in changed federal mine legislation is reduction of expense in patenting a mining claim.

DURING the past year zinc ore has increased 25% in price, with the result of a "boom" in the zinc districts of Missouri.

SPOKANE, Wash., mining brokers have formed a protective association to secure local enforcement of the war revenue law.

The Railway Age says that \$60,000,000 will be spent this year in railway construction, of which \$48,000,000 will go to labor.

The superintendent of the Government assay office at Boise City, Idaho, says the State produced 125,000,000 pounds of lead during '97.

THE May aggregate of gold yield in New South Wales was 20,925 ounces. For the first five months of '98 the total was 116,347 ounces.

At the drilling contest in Victor, Colo., July 4, Lyons & McCullough drilled 36 9-16 inches in Gunnison granite and took first prize of \$200.

The net proceeds of the Silver Bow county, Montana, mines for the fiscal year ending June 30th, '98, according to the assessor, were \$7,688,570.

THE Mining and Industrial Reporter and the Mining Industry and Review of Denver, Colo., have consolidated and will prove that in union is strength.

THE Willows, Cal., Promoter says that along the foothills to the west wells are going dry, springs ceasing to flow, and that a water famine has set in.

WHEN the war broke out sulphur bounded from \$18 to \$45 per ton. Better understanding of cosmopolitan conditions has since dropped the price to \$21.

AMONG the 118 passengers arriving on the steamer Elder at Seattle from the Copper River country nearly all told a tale of disappointment and discouragement.

In the case of Peardon et al. vs. The Alexander M. Co. at Smartsville, Cal., Judge Ellison held that the liens of workmen take precedence of other claims.

In the North Star mine at Robinson, Utah, J. C. Fulmer noticing that one of the holes had missed fire pulled out the fuse, an explosion occurred and killed him.

THE "Zymean process," so far as known, is a laboratory one and is believed to be empirical. It is not considered worthy of serious attention by practical metallurgists.

THE waste ore from mines in Mohave county, Ariz., is to be treated by a pyritic smelter and concentrator to be erected somewhere on the line of the Santa Fe Pacific.

THE mines and smelter at Alabama City, N. M., have closed down. The men wanted higher wages and were refused. There are seventeen lead mines in that locality.

EXPERTS say artificial stone cannot be successfully made with silicate of soda. Silicate is sometimes used for drying the surface, but does not ordinarily enter into its construction.

WASHINGTON STATE, always emulous of Oregon's fame, now lays claim to the discovery of gold in Ellensburg duck gizzards. The lost Blue Bucket mine is also reported discovered again.

FROM all parts of California come reports of temporary cessation of active work because of the prevalent drouth. With the close of the war and the fall rains will come renewed activity.

NORTHERN CALIFORNIA placer miners are taking advantage of the unprecedented low water, and wing-damming and river-bed mining will be unusually active till the winter rains set in.

NEAR Boise, Idaho, three dredging companies calculate to handle 3500 cubic yards of gravel daily, each. They will operate on such a large scale that they expect 5-cent gravel to be worked at a profit.

"VARISCITE" is a green gem stone of cabinet value and

very scarce. The chief market for variscite is found in China and Japan. So far as known it is indigenous to Camp Floyd mining district, Utah.

THE Stockton, Cal., Mail says that the Stockton and Tuolumne railroad will soon change hands. A controlling interest is to be sold to a Chicago company which will push the line to Summerville and across the Sierras.

THE bill exempting locators of mines who volunteer in the army and navy from proving up so long as they are in the service, and allowing their rights to stand, became a law by the approval of the President July 12.

GOLD dredging near Bannack, Montana, continues. A Philadelphia company that recently bought the Cope placers there is building a larger boat than the A. F. Graeter, and talks of building four more for next season.

ALASKAN reports point to the possibility of the Manook Creek district developing an ancient river channel, supposedly as full of gold as the ancient river channels in the California Sierras. The latter are still partially undeveloped.

THE new revenue law will stop the custom of incorporating mining companies with a capitalization of \$1,000,000, as the stamp tax of 5 cents on every \$100 face value of original certificate would alone require \$500 in internal revenue stamps.

"A FOOT POUND" is 1 pound lifted 1 foot in 1 minute. A "horse-power" is 33,000 times that. The last has long been objectionable as a unit of measurement, but so far nothing has been agreed upon to take the place of that obsolescent term.

THE Merrifield mine, Nevada Co., Cal., has paid over \$1,000,000 in dividends. Edward Merrifield, its discoverer and former owner, died in San Francisco about three years ago while working for Wells, Fargo & Co. as way-bill clerk for \$60 per month.

AT Cripple Creek, Colo., a new system of placer mining is in operation. There is a deposit of black sand on the bedrock which carries iron besides gold. The whole product is treated as a concentrate and shipped to the smelter. Twelve tons returned \$140 in gold per ton.

NEW diamond discoveries are reported at Hopetoun, eighty miles southwest of Kimberley, South Africa. Nearly 10,000 people have gathered from all parts of the country awaiting the authorization of the Cape Government, which will be followed by a rush for claims.

IN a quarry near Holly, Cal., by the unexpected explosion of a stick of giant powder carelessly left in a rock partly drilled and abandoned without a fuse attached to give warning, J. Craig lost his sight. I. Knox will not survive and C. Howe is in a doubtful condition with concussion of the spine.

EMPLOYEES of the Widman G. M. Co. at Sutter Creek, Cal., have organized a mutual accident aid society. The monthly assessments are \$1; permanently disabled members get \$250; if temporarily disabled, \$1 per day, physician and nurse's fee. In case of accidental death his dependents receive \$250.

IT is calculated that each 1850-lb. stamp dropping 100 times per minute will require 2 1/2 H. P.; each 900-lb. stamp, at the same drop rate, 2 H. P., and each 750-lb. stamp 1 1/2 H. P. Boiler feed for each H. P. per hour will average five gallons water; each stamp per hour will require from 60 to 75 gallons; each concentrator per hour 250 gallons.

IN a 5-stamp mill 1, 5, 2, 4, 3 is considered good arrangement in drop, making uniform the splash of the water and pulp in the mortar. Thus, No. 1 dropping sends the water through the battery lengthwise, which No. 5 in falling catches and throws back, the same with No. 2, sending it back to No. 4 in its descent, No. 3 equalizing the swash.

JUDGE MORROW of the U. S. C. C. has overruled the demurrer to the complaint in the case of Skinner vs. Garnett M. Co., which had been removed from Sierra county, Cal. This suit was brought under the so-called pay day acts, for wages due a number of workmen employed upon the Garnett mine, near Hepsidam, Cal., and involves the constitutionality of these acts.

IN answer to an inquiry from Saguache county, Colo.: "Is an open cut or tunnel 10 feet long and with a 10-foot face a legal assessment?" the Denver Post maintains that it is not a legal assessment unless it shows a lead in the face or breast of the open cut or tunnel. No assessment is legal that does not disclose a vein. The assessment is only legal when the crevice or vein is shown at 10 feet from the surface.

IN the case of the Selby Smelting & Lead Co. of San Francisco the U. S. Attorney-General has decided that drawback of the duties paid on imported lead, retained in a bonded establishment and subsequently withdrawn on payment of duties for domestic consumption, as provided by the Act of July 24, '97, should be allowed upon the exportation of the articles manufactured wholly from such lead under Section 30 of the same Act.

C. KELLEY of Helena, Montana, in '94 sued the Fourth of July Mining Co. for \$50,000 damages and got judgment for \$15,000. The company was insolvent. Another action was brought to hold the stockholders liable. The Montana Supreme Court now decides that the stockholders are so liable and must pay. The decision will deter the acceptance of stock in mining companies by men who know that such acceptance is merely meant for privilege to use their names.

NOTICEABLE are the movements of gold and silver for the year ending June 30, '98. While exports of gold coin and bullion aggregated only \$15,324,929, the imports amounted to \$115,173,988—an increase of \$33,762,455 as compared with '97, showing an excess over the exports amounting to almost \$100,000,000. The silver movement for the year was, in the main, an export one. Exports were \$54,942,572; imports, \$10,890,261; exports showing an excess over imports amounting to over \$44,000,000.

"MOUNTAINS OF GOLD" and "rich mining strikes," as reported in the daily newspapers, are as unreliable as some war news or the "\$50,000,000 coming from the Klondike." As a cold matter of fact, any one having the money to pay for it can have any alleged fact in connection with "business" placed in certain daily papers under telegraphic headings marked "By Telegraph," and apparently so sent from the place designated in the "dispatch." The most prominent advertising agency in the country widely proclaims its ability to furnish such service and secure the insertion in some dailies of such bogus news.

THE following is considered a practical recipe for a welding compound: Ten parts of borax and one of sal-ammoniac; grind them together roughly, and then fuse them in a metal pot over a clear fire, taking care to continue the heat until all

the acum has disappeared from the surface. When the liquid appears clear, it is ready to be poured out to cool and concrete, afterwards to be ground to a fine powder. A small quantity of this composition will be sufficient, sprinkled on the parts to be welded while in the fire. The steel is to be raised to a heat which may be expressed by bright yellow. It is then dipped into the welding powder and again placed in the fire until it attains the same degree of heat as before. It is then ready to be placed under the hammer.

LAST year the Alaska-Mexican Co. raised 158,005 tons ore. The mill crushed this, average duty of stamps per day of twenty-four hours being 3 7/8 tons, at a cost of 32 1/2 cents per ton; 2863 tons concentrates were saved; these were treated by the chlorination process at the Alaska-Treadwell works at a charge of \$10 per short ton; the chlorination saved 93.7% of the gold contained. Of the \$335,629 gold yielded, \$236,332 was free gold from the mill; the remainder from the sulphurets. The chlorinated concentrates averaged \$31.18 per ton. The average yield of the 158,005 tons crushed was \$1.43 free gold and 70 cents sulphurets, an average of \$2 1/2 per ton. The expenses for the year were \$248,528, the profit was \$87,101. The daily average number of employees was 143. In addition to board and lodging miners were paid \$2.50 per day, laborers \$2, drillmen \$2.50, engineers and mechanics \$2.50 to \$4.

AT Lake Charles, La., the process of extracting the sulphur is as follows: A 10-inch pipe is first driven through the surface to the sulphur bed, 526 feet below the earth's surface. A 6-inch pipe is then placed inside of this 10-inch pipe. Water is forced from the boilers into a reservoir and maintained at the temperature of 335° Fahr., and allowed to flow by its own gravity down this 10-inch pipe into the sulphur bed. This water liquefies all sulphur with which it comes in contact. The sulphur, being of a greater specific gravity than water, sinks below it. It is then pumped to the surface by a pump which is run down inside a 3-inch pipe inside of the 6-inch pipe. This pump has a capacity of five tons an hour or 120 tons per day. When the sulphur is pumped up it is thrown into vats 10 feet wide, 20 feet long and 12 inches deep, where it solidifies in a few hours, and is broken by pickaxes into blocks ready for shipment. This sulphur comes to the surface at a fraction above 99 per cent pure, and is in a purer condition than it would be if taken from the ground in its virgin state, as any heavier substance would sink below and a lighter surface would float on the water, so that it may be said to be refined by this process of liquefying and pumping. Nearly 120 tons per day are thus produced.

HERR A. VON DESSAUER writes to the Chemical and Metallurgical Society of South Africa: "Experiments which I carried on for two years in the 120-stamp mill of the Twelve Apostles Gold Mining Company, Transylvania, and other mines, provided that the amalgamation with warm or cold water was equally good; the battery water in summer varied from 80° to 90°; in midwinter it had been from 34° to 36°. The theoretical and actual extraction in both seasons showed hardly any difference; but amalgam obtained from warm water had 25 to 35 per cent of gold, whereas it yielded in winter time only 7 to 10 or 12 per cent gold. The most dangerous seasons for amalgamation were spring and autumn, as the temperature of the mill water varied enormously in consequence of night frosts. Amalgam that had settled hard on the plates out of cold water during the night time, got soft in the day time, and was washed down the plates into the mercury traps and even beyond those. It seems that the percentage of gold in hard amalgam is in direct proportion to the temperature of the pulp. The quantity of mercury needed in winter was therefore three or four times as large as in summer for a given quantity of gold. The loss of mercury from plates was larger when warm water was used, but it is considerably larger in the rotating amalgamation pans when cold water was used."

AN article in last week's issue gave all the procurable authorities on the size of mesh of battery screens, regarding which there is no recognized standard. In connection therewith it is further in order to note that wire screens take their numbers from the meshes to the linear inch; perforated and slotted screens are numbered from the needle used in punching them. In gold milling the most commonly used sizes are No. 6 to No. 9 for perforated and slotted screens and No. 30 to No. 40 of the wire screens. The slots are from 1/4 to 1/2 inch long, in alternating or even rows, sometimes burred on the inner side. The following table gives the comparative different varieties and numbers:

| No. of Needle. | Corresponding Mesh. | Width of Slot (Inches). | Weight per Sq. Ft. (Lbs.). |
|----------------|---------------------|-------------------------|----------------------------|
| 5 | 20 | .029 | 1.15 |
| 6 | 25 | .027 | 1.08 |
| 7 | 30 | .024 | .987 |
| 8 | 35 | .022 | .918 |
| 9 | 40 | .020 | .837 |
| 10 | 50 | .018 | .735 |
| 11 | 55 | .016 | .666 |
| 12 | 60 | .015 | .600 |

The size needed in individual cases is a matter of opinion on the part of the millman, ore carrying fine gold requiring finer crushing, ores with considerable percentage of sulphides needing extremely coarse crushing.

REGARDING the two Supreme Court opinions published in the issues of July 2d and July 9th, it may be further said concerning the answer "Yes" to the following question: "If the apex of a vein crosses one end line and one side line of a claim as located thereupon, can the locator of a vein follow its dip beyond the vertical lines of his location?" that if a vein enters a side line and goes out of an end line of a claim, the extralateral right to follow the vein on the dip is confined to the side line; it cannot be followed on its dip beyond the end line, and only so much of the vein can be followed on the dip as there is of apex within the limits of the location. It is exactly as though the end line which is not crossed by the vein was brought right up to the point where the vein crosses the side line, and between those two end lines as contracted, the miner may follow the vein on its dip beyond his side line. Other recent decisions may not be without interest: If a vein enters a side line and departs out of the same side line the miner has no extralateral right whatever, but is confined solely to his intralateral right of mining within his lines entirely. If a miner locates along the course of his ledge 1500 feet, he can have only one dip right; he may discover a ledge that runs across his location, but he cannot follow it on its dip beyond his end lines. But if he mistakes the course of his vein in making his location, his end lines will become his side lines, and then he will have the right to follow the ledge on its dip beyond his new side lines, which were originally his end lines.

The Development of the Cyanide Process.

Following is a paper read by Wm. Orr before the International Mining Congress at Salt Lake City, Utah, July 8th, '98, and specially reported for the MINING AND SCIENTIFIC PRESS:

Five years ago the total cyanide mills in America would not exceed five or six in number and to-day, I am conservative in stating, there are over fifty plants in the United States employing the MacArthur-Forrest cyanide process. Take the State of Utah for example. In 1893 there was only one cyanide mill in operation, namely, the famous old Mercur mill, with the history of which almost everyone is familiar, and to-day there are in operation, or in course of erection, no fewer than fifteen cyanide plants within the boundaries of the State. In Camp Floyd, commonly called Mercur district, alone, there are ten cyanide plants, and as this district is dependent entirely on the cyanide process for its ore reduction, I will give you a brief sketch of the methods which have been employed and the difficulties which I (as the representative of the MacArthur-Forrest Co.) have encountered in the reduction of the ores of this district by means of cyanide. The ore is principally an altered or silicious limestone, which can be easily pulverized; in fact this feature of the ore was the cause of the first difficulty encountered by the pioneer operators. Fine crushing was entirely out of the question for this ore as the fines thereby produced retarded or entirely stopped the circulation of the cyanide solution. Here the extremely porous character of the ore came to the assistance of the millman, enabling him to leach the ore in a coarse condition (from a $\frac{1}{4}$ -inch to $\frac{3}{4}$ -inch mesh) when he would otherwise have been driven to employ agitation and decantation as his method of extraction instead of the simple and economical method of percolation. Beginning by crushing the ore to 10 mesh, which was found impracticable, the mesh has gradually been raised until $\frac{3}{4}$ -inch mesh has been reached in some cases. From $\frac{1}{4}$ -inch to $\frac{1}{2}$ -inch mesh, however, has been found to yield the best results.

It is impossible to fix a definite mesh for all the mines in the district, as they vary considerably in character, some—such as the Geyser-Marion and Brickyard, being much more silicious in character than the Mercur, Sacramento or Sunshine. Four or five years ago it was considered necessary to leach the ore at least four days, but this was eventually found unnecessary and the time has been reduced to from forty-eight hours to seventy-two hours, and may in some cases reach eighty-four hours with talcy ores. It is a remarkable fact that the gold in the ore in this district can be entirely brought into solution in fifteen minutes under favorable conditions, such as by agitation at 10 mesh, so that on a commercial scale the time taken in obtaining a satisfactory extraction is chiefly required in actually washing out or displacing the first solution, which, from experiments I have made, I conclude, must have dissolved the greater part of the gold. The strength of cyanide solution employed has also been greatly reduced and now the strength generally used varies from $\frac{1}{10}$ to $\frac{2}{10}$ of 1 per cent, and I have even seen a solution containing $\frac{1}{10}$ of 1 per cent produce an excellent extraction, but the precipitation with this solution was imperfect until the solution was restrengthened. The result of this change in the strength of the cyanide solution now employed from that used five years ago, namely, $\frac{1}{2}$ of 1 per cent to 1 per cent is a great reduction in the loss of cyanide and therefore in cost. A great saving in the loss of cyanide in some cases has also been effected by the addition of lime, thereby neutralizing the acid salts deleterious to the cyanide and which occur principally in the surface ores; in fact on one occasion I experienced the total loss of the cyanide in solution and on investigation found it was due to the presence of some surface ore from a new ore chute, the ore from which contained a large amount of acid salts. On testing this ore I found the loss of cyanide, without the addition of lime, was nine pounds per ton; with lime added three-quarters of a pound per ton. Without careful attention an occurrence of this kind will result in a heavy loss of gold in the tailings if the trouble is not speedily located and overcome. The acidity in the Mercur oxidized ore is principally due to acid iron, aluminum and magnesium salts which can be neutralized to a large extent by the addition of lime. This lime is added as the ore is charged into the tank, the quantity used being from one to two pounds lime per ton of ore. The lime is generally prepared by the method known as dry-slaking; that is, taking the quicklime and adding only sufficient water to reduce the lime to a fine, dry powder. Thus prepared it is easily powdered and is presented in a very efficient form. The exact amount of lime necessary requires careful calculation, as either an insufficient supply, or an excess, will give disappointing results.

The consumption of zinc, like that of cyanide, has likewise been greatly reduced within the last five years, and now only from one-quarter to three-

eighths of a pound is consumed per ton of ore treated. Judicious handling of the lime has an important bearing on the consumption of the zinc.

The surface or oxidized ores of the Mercur district, however, present few difficulties, but occasionally a pocket of unoxidized ore will find its way into the tanks and therewith make its presence felt in a most objectionable way. This unoxidized ore contains the following minerals which affect the solution, namely, native sulphur, the arsenic sulphides (regular and orpiment), ferrous arsenide compounds, and occasionally a certain kind of shale. No chemist could suggest a more deleterious mixture for effectually checking the solution of the gold. The alkaline cyanide solution acting on the sulphur and sulphides produces a soluble alkaline sulphide, in presence of which no gold can be dissolved. The cause of this is easily explained. Gold to be dissolved by a cyanide solution requires the presence of oxygen in that solution. By the introduction of even a very small quantity of such a strong reducing agent as an alkaline sulphide the oxygen is removed and the solution of the gold rendered impossible. Therefore, before the cyanide solution thus found by the pressure of an alkaline sulphide can be rendered effective this sulphide must be removed either by oxidation to sulphate or precipitation as an insoluble sulphide. The ferrous compounds in the base ores are also extremely injurious, but act in a different way from the sulphides, namely, by conversion of the cyanide into ferrous cyanide, which, for all practical purposes, is a non-solvent for gold. Another occasional constituent, the shale, acts in a similar manner to the sulphide, namely, as a reducing medium, thereby rendering the solution ineffective. This shale has also the property of precipitating gold already in solution through virtue of the carbon it contains. I have taken a solution assaying \$11.60 per ton and after circulating it through some of this pulverized base ore for twenty-six hours found it then assayed only \$9.20. It will thus be seen that the base ore of the Mercur district is a hard combination for the cyanide process. I have found the entire stock of solution in several of the mills being run to waste, because, according to the millman, "it had become fouled by arsenic." I have shown by the above that this is partly an erroneous idea, as the arsenic, while present, is not the real cause of the trouble. The sulphur, in combination with the arsenic, the ferrous iron, and the carbon in the shale are the causes. I have treated an ore containing over 3 $\frac{1}{2}$ per cent of arsenic with satisfactory results, but the arsenic in this case was carried in the minerals scorodite and haidingerite—oxidized varieties of arsenic minerals. In fact arsenic is present at all times in the cyanide solution in the Mercur district and is precipitated to a certain extent on the zinc with the gold.

The sulphide in solution accounts for the fact that the solution, after having been used on the base ore, is inefficient when turned on to a thoroughly oxidized ore, even although it may have had more cyanide added and the solution again brought up to the working strength. Careful attention at the mine, however, can almost entirely eliminate this danger from the base when working the oxidized ores, as this base ore occurs principally in bunches along the hanging wall, where it can be left hanging or sorted out. When the workings get deeper and the base ore becomes general, roasting will become absolutely necessary, and this is the metallurgical problem which will require to be decided in the near future, and is being investigated at the Golden Gate mill at the present time. A superabundance of talc in the oxidized ore sometimes causes trouble in leaching, but this is only a mechanical difficulty and can be obviated in most cases in the district by judicious mixing of the different characters of the ores at the mine before going to the mill to be crushed.

On some of the ore of the West Dip of the Mercur district, however, roasting of the oxidized ore will be absolutely necessary before it can be successfully treated, owing to the large percentage of talcy and clayey matter which it contains, as in the case of the La Cigale ore. This talcy and clayey ore, which is composed of hydrated silicate of magnesium, hydrated silicate of aluminum, etc., on being roasted, becomes dehydrated and in this condition leaches beautifully. The secret in treating very slimy ores successfully is to heat that ore to a sufficient temperature to expel the water of hydration (combined water of the silicates and oxides) when an easy leaching process will be produced.

The extractions obtained in the Camp Floyd or Mercur district by the MacArthur-Forrest cyanide process are very good, considering the character and grade of ore. Metallurgists will agree with me when I say that an extraction of 75 to 80 per cent on \$4 ore and 80 to 86 per cent on \$6 ore is good work, and that is what is being done on ore in the Camp Floyd district at the present time. I now come to a very important point, and one which will probably be of interest to all, namely, the cost of mining and milling by cyanide in the Mercur district. Mining in the Mercur district is being done at a cost of from \$1 to \$1.50 per ton and the milling from 75 cents to \$1 per ton, and several of the companies in Mercur are mining and milling by cyanide for less than \$2 per ton. This low figure for cost has enabled some of the com-

panies to work \$3 ore at a profit, and is ample testimony to the value of the cyanide process.

In concluding, then, my remarks on the Mercur district, I will point out the daily capacity of the cyanide mills in operation at the present time, to which I will add the capacity of those in course of erection, and which will be ready for crushing within the next two months, to illustrate the great development which has taken place within the last five years.

At the beginning of 1893 the capacity of the cyanide mills in the district was fifty tons per day; at the present time it is 1500 tons per day.

But the use of cyanide has developed equally rapidly in other States besides Utah. In the Cripple Creek camp of Colorado about 12,000 tons per month of ore varying in character and value are successfully treated in custom cyanide mills. When the process was first introduced into Cripple Creek four years ago the camp was in its infancy, and the ore treated was almost entirely of an oxidized character which readily yielded its value to cyanide, but, as the camp developed, the character of the ore changed, becoming base, the values being carried in the "live" tellurium minerals and iron pyrites. This necessitated a change in the method of treatment, which was effected by first roasting the ore before leaching, thus overcoming the difficulty and enabling the process to become available for both the oxidized and base ores of the district.

Another result of cyanide research has been to prove the thorough efficiency of the process when applied, not only to ores of low grade, but to gold-bearing rock carrying values as high as four or five ounces.

In Arizona, where the cyanide process was operated in the early stages of its introduction into this country, quite a number of large ores and tailing plants are being successfully operated. In connection with the copper characteristics of the Arizona ores, it was formerly generally accepted that the presence of a small quantity of copper entirely prevented treatment by cyanide, but a modification of the process has been devised which meets this difficulty to a very large extent. In one of the Arizona tailing plants the cost of profitable treatment has been brought as low as 65 cents per ton on tailings which five years ago were considered untreatable. Considerable interest has recently been manifested by the mining operators of Montana regarding the use of cyanide, and at the present moment four new mills are either starting up operations or are in course of erection. Time will not permit me to detail the cyanide successes of California, Black Hills, Idaho, Oregon, Nevada, etc., but the extension of the use of cyanide, based largely on the results of careful experiments conducted on ores from all parts of the United States, leads to the conclusion that in many cases where the first appearance of an ore does not look favorable for treatment by cyanide, a judicious modification of the process, under expert guidance, will achieve satisfactory results. One of the greatest drawbacks, however, to an extension of the use of cyanide is the result which occasionally follows the starting up of cyanide operations without experienced supervision. Mr. Montgomery, from Colorado, complained the other day, and justly so, of the principle prompting Eastern capitalists to send out their friends, who are absolutely inexperienced, to take charge of mines. Many of these Eastern representatives, who might be diffident about taking charge of a mine, have no hesitancy whatever in accepting the responsibilities attaching to the running of a mill, particularly a cyanide mill, as this process, to the uninitiated, seems to present few difficulties. With the facilities which every mine owner can now have for having his ore thoroughly tested and reported upon before incurring a nickel of expense in the erection of a cyanide plant, it is absolutely unnecessary to incur the expense of plant erection until the prospective operator knows exactly the most economical modification of the process to follow, the actual extraction to be obtained, and the cost per ton to be incurred in the obtaining of that extraction. In other words, provided the mine continues to carry the values, nothing need be left to chance in the treatment of the ore by means of cyanide or potassium.

United States Copper Production.

The following table gives figures for 1896 and 1897 for the States in the Union producing copper:

| States. | 1896. Pounds. | 1897. Pounds. |
|---------------------------------|------------------|------------------|
| Arizona | 73,745,321 | 81,019,932 |
| California | 1,971,545 | 14,129,020 |
| Colorado | 9,539,245 | 9,437,683 |
| Michigan | 144,058,524 | 145,839,749 |
| Montana | 228,958,164 | 237,158,540 |
| Utah | 3,550,050 | 3,854,821 |
| Eastern and Southern States.. | 3,750,124 | 3,727,939 |
| All others | 2,050,000 | 2,018,929 |
| Copper in sulphate | 12,183,210 | 13,003,236 |
| Total domestic production | 479,806,183 | 510,180,719 |

Prices for the year 1897 were higher than in 1896, the average in New York being 11.29 cents in 1897, against 10.88 in 1896. In the world's production of copper for the past year the United States leads the list.

Some Business Aspects of a Mine.

The Helena, Montana, *Independent* of the 9th inst. publishes parts of a special report just made by the directors of the Hecla Consolidated Mining Co., containing data about the property additional to that contained in the last annual report, and giving the result of a special examination recently made of the company's property by a stockholder of long standing, and of interest to mine managers and stockholders in general.

In his annual report, as far back as '81, General Manager Knippenberg had said: Nothing in mining should be considered as available to stockholders except cash. For twelve years I have insisted that the cost of all permanent improvements, buildings, tramways, machinery, supplies, etc., amounting in this time to more than \$300,000, should at once be charged to expenses, and that the stockholders should be shown, as profits each year, only the cash remaining after all expenses have been paid. You may call this a cold-blooded proposition, but it is a safe one, and never deceives. Suppose that to-day I should show you a surplus of \$500,000, consisting of smelter, concentrator, machinery, tramways and all other tools and machinery (and these originally cost the amount claimed), but should show your mines entirely exhausted, how would you divide these assets? Sell them you could not. Cash is all you can divide between the stockholders. The curse of the mining industry is the fictitious value placed upon unknown quantities of ore of uncertain quality, and finely engraved stock certificates, entrapping the unwary and innocent, only to let them find out how quickly the supposed millions can vanish. Such schemes are based upon wind, and are conceived in diseased and disordered minds. Every dollar invested in a mine must come back, if at all, in the shape of dividends. Stop paying dividends, honestly and forever, and your capital stock is worthless—an empty hole in the ground is your entire assets.

The board of directors appointed D. N. Ramsdell a commissioner to examine the property in March, '98, and directed him to incorporate in his report seven questions. The first was:

Why has there been no reduction in wages when silver and lead have declined?

Mr. Ramsdell replies to that: The miner receives \$3.50 a day for ten hours' work; the helper receives \$3 a day; engineers receive \$4 a day of ten hours; firemen, \$3.50; the foreman receives \$6 a day. These are the same wages that have been paid for twenty years. It looks unreasonable that with the decline in silver wages should remain the same. No man can understand this, except he be on the ground, and see the situation and thus learn why. Every attempt that has been made in Montana or Idaho to reduce these wages has failed, and resulted often in the destruction of property and loss of life. The mine owner has but one right: he may close down his property and let it go to destruction. The Miners' Union—headquarters at Butte—fixes the wage rate, and in a large measure the management. My visit to Butte City and further investigation have satisfied me that to reduce the wages of our miners is impossible.

Of the iron mines located at Soap gulch, fifteen miles from Glendale, Mr. Ramsdell says: They have been practically abandoned. The iron ore has become so poor that it cannot be used as flux, and the general manager now buys iron ore at Salt Lake City. The value of these mines is nothing.

Thirty questions, asked by stockholders not directors, are referred to. Four referred to the labor question. These questions and the commissioner's answers are:

Q. Whether it is possible to reduce the wages and other expenses? A. It is possible to reduce wages, even to a point below a living wage; but in doing so you would lose your expert men, and would be obliged to work inexperienced men, whose blunders would cause more loss than their wages would amount to. In the one item of the careless handling of dynamite you would be in constant danger of damage to property and the killing and injury of innocent persons; and should you employ a man as a miner who has no knowledge of explosives, you would be responsible for any damage resulting from his inexperience and ignorance.

Q. Whether it is possible to work the mines on the co-operative plan, by reducing the wages of miners and employees, and, as an inducement, giving them a per cent of the net profits? A. The "ups and downs" in all mining ventures are against such a plan. Miners will lease mines and pay a royalty on ores produced. This is as near a co-operative plan as seems feasible, to my mind, in our situation.

Q. Are the wages paid by the Hecla Co. lower, higher, or the same as paid by other lead and silver mines in Montana? A. Taking favorable contracts for labor into account, I would say that they are as low or lower than other mining companies.

Q. What is the prospect of reducing the wages paid miners, and can it be done, and if so, how? A. Expert miners' wages cannot be reduced. "Scab"

miners are not reliable and should not be employed. One good miner is worth half a dozen poor ones.

Another stockholder wanted to know what the mine would be worth closed down. Mr. Ramsdell replied: The value of the Hecla property lies in its mines. The concentrator and smelter are creatures of the mines, and depend entirely upon the mines for their operation. When the mines stop they stop. The machinery and buildings at Glendale and Greenwood (concentrators) are old and worn, and virtually worthless for any use other than that for which they were intended. If some of the machinery were in Butte it might have a value; but to sell it where it is I would deem impossible. As to the mines, I would think that if the Hecla Co. should abandon them their value would be nil in the opinion of others looking for an investment. I would not say our property has no salable value, yet I cannot say it is salable should we abandon it.

In answer to the questions put by an outside stockholder: Would the mine be operated just as well without Mr. Knippenberg as with him? In other words, can his position be dispensed with? Or, in event it cannot be, would a less expensive man do as well? Could Mr. Barbour do the work without Mr. Knippenberg's supervision? The answer was: The mine is the foundation upon which the Hecla Co. has been built; but the foundation is not all of the structure. That Mr. Barbour can superintend the mining of ore without Mr. Knippenberg's assistance or supervision cannot be denied; but the superintendent of mines is but one link in the chain, but one department of your mining work in Montana. Your ore must be reduced, and that requires your smelting department. Your books must be kept, and your miners and laborers and contractors paid, and that requires your cashier's department. These departments must have a head to which they may turn for counsel and instruction. If it were not so, there would be no harmony in action. Some one must be over all of your departments, and be responsible to you for the conduct of each of them. The gentleman who has served you in the capacity of general manager for so many years is the right man in the right place. Keep him, then, if he will serve you, is my advice.

The stockholders adopted the report unanimously at a subsequent special meeting.

Recent Additions to Museum of the California State Mining Bureau.

Mercuric oxide: Formed in the bricks of old, worn-out furnace recently torn down at the New Almaden quicksilver mine, San Clara Co., Cal.; C. C. Derby.

Specimens of conglomerate from supposed ancient river channel in Trinity Co., Cal.; Geo. Madeira.

Several specimens of rich telluride gold ores, ranging from four to ten ounces of gold per ton, in a schistose dioritic gangue, from mines at Kalgoorlie, West Australia; James Parkinson, M. E.

Auriferous black sand (concentrate from sluices), assaying \$393 gold per ton: East Fork of Trinity river, Trinity Co., Cal.; W. H. Foster.

Rich silver ore, assaying 1000 ounces of silver and \$4 to \$6 per ton gold: Whitewater mine, West Kootenay, B. C.; J. W. Powell.

Wire gold, resembling a braided cord, in quartz, from the Golden Rule mine, Stent, Tuolumne Co., Cal.; B. M. Newcomb.

Crude sulphur, alum, etc., from properties of the California Asphaltum Company, Ventura, Cal.; J. A. Dubbs, Mgr.

Native copper: Red Cap mine, Red Cap creek, Humboldt Co., Cal.; E. V. Burke.

Rhodonite, silicate of manganese: Sawyer's Bar, Siskiyou Co., Cal.; E. V. Burke.

Iridosmine: Demidoff estate, Ural mountains, Russia; Dr. David T. Day.

Molybdenite, fine specimen from a mine near Grizzly Flat, El Dorado Co., Cal.; Alexander Oliver.

Crude sulphur: Lassen Butte, Shasta Co., Cal.; J. A. Heslewood.

Muscovite mica: Oro Fino, Siskiyou Co., Cal.; John M. Conner.

And others of less importance.

H. S. DURDEN, Curator.

The lightest metal tubing is now made from an alloy of nickel and aluminum. A quantity recently made for electrical instruments was only 0.036 inch in outside diameter, with walls 0.0015 inch thick, and 3,000 feet weighed but a pound. A still more remarkable specimen was only 0.01 inch in diameter, with a hole that could be seen only with a magnifying glass. These tubes mark great progress in aluminum working, as a few years ago such alloys could not be drawn.

KRYPTON, the newly-discovered fifth element in the air, is supposed to be somewhat greater in density than oxygen, and to constitute about 20/100 of the atmosphere. The sixth constituent now suspected to exist, is believed to be, like helium, lighter than nitrogen.

The Minerals Which Accompany Gold and Their Bearings upon the Richness of Ore Deposits.*

By T. A. RICKARD, State Geologist Colorado.

In examining a lode only incompletely developed and in a new country, what is the evidence on which a correct estimate of the prospective value of the mine may best be based? The two most common answers would be a plain denial of any man's ability to see further into the ground than the point of his pick, and against this miserable *non possumus* would come the reply that the best indication would be found in the presence of particular minerals in association with the gold.

It is this question of indicative minerals which I propose discussing. The experience of certain mining districts has gone to prove that gold is notably accompanied by particular minerals, and this to such an extent that they are considered to assure the richness of an ore in which the gold itself cannot be visibly discerned. These "indicative minerals," as they may be termed, are not the same in every locality. A few samples, such as have come within my own experience, may be quoted. Every mining engineer can add to the list.

In Boulder county, Colorado, roscoelite (a vanadium mica) is closely associated with the tellurides of gold (calaverite and sylvanite). I recognized the same rare mineral in the telluride ores of Kalgoorlie, in West Australia. At San Andreas, in California, uranium ochre (the yellow oxide of uranium) is found to distinguish the pockets of specimen gold ore to such an extent as to serve for a guide in prospecting. In several parts of Arizona, in Yuma, Yavapai and Pinal counties, especially the last, vanadinite and descloizite (both vanadates of lead) characterize ores rich in gold and silver. Wulfenite (the molybdate of lead) often accompanies the vanadium minerals, and has been noticed in the ores of the Comstock in Nevada and the Vulture, Maricopa, Ariz. The association of gold with these lead ores is notable, because the particular minerals mentioned are all of great beauty and delicacy. The same may be said of crocoite (the chromate of lead), which characterizes several gold veins in the North Coolgardie gold field, especially at Menzies. The more common sulphide, galena, is also an accessory mineral in the richest mines at Menzies, and accompanies coarse native gold. At Niagara, Pinyalling and Wagie-moola—three widely separated localities in West Australia—I found gold closely associated with tourmaline in the form of acicular crystals in contact with coarse gold and also in a condition of minute diffusion forming dark blotches in the white quartz. The gold ores of the Mysore in India carry tourmaline.

Occurrences such as have been enumerated would seem at first sight to afford a much-needed aid to the explorer. It is unfortunately easy to prove that as evidence they and any number more of them are of very uncertain value in a new mining territory, because they are contradicted by similar testimony of a negative kind must be regarded rather as chance coincidences. Take the case of zincblende. One locality was quoted where this mineral is a sure sign of a generous amount of gold and silver in the ore. The Morgan mine, in Wales, affords, I understand, corroborative testimony. At the East Murchison mine, in West Australia, this mineral has been found to be an almost unerring guide in separating rich from poor ore. But in Arizona it is a common experience that the impoverishment of lodes in depth, when it does occur, is concomitant with an increasing percentage of zinc. Other regions echo this unpleasant fact. Broken Hill knows it. Again, take the beautiful mineral fluorite or fluorspar. The association of fluorite with the tellurides of gold was early recognized in both the Boulder and Cripple Creek districts of Colorado, and the purple tint imparted by this mineral was speedily hailed as a distinction peculiar to rich veins. Later experience, notably in Park county, has proved that poor ores are favored with fluorite no less than the bonanzas. I have mentioned a locality where rhodochrosite is esteemed a favorable mineral. But while it is thus characteristic of rich ore at Rico, in Colorado, it is a negligible factor in certain lodes at Butte City, Montana. Again, consider calcite. When it is seen amid the gold-bearing quartz of California, it is recognized with regret, because it so often means a falling off in values, while at Kalgoorlie the same mineral characterizes ores rich in calaverite (the telluride of gold), and at Rhoda, in Transylvania, a very valuable gold vein has been worked whose matrix was essentially calcite.

We are all familiar with mines in which iron pyrites is so intimately associated with the gold that a lessening of the one means a diminution in the other. There are also cases where an excessive percentage of pyrites coincides with impoverishment. Moreover, there are lodes in which the coarse cubes of pyrites are less favorable to the presence of gold than the finely crystalline variety, but there are also those in which the reverse is true. There used to be

*Condensed from a paper read before the Institution of Mining and Metallurgy.

an idea that coarse cubical galena was less silver-bearing than the fine-grained kind, but this as a generalization has long since been exploded. Thus, therefore, it requires but little sifting of this sort of evidence to emphasize its contradictory character.

The rich lodes of the same district frequently differ widely in their mineralization. Poor veins often carry the ores considered characteristic of the rich ones. The neglect of the former causes this fact to be overlooked. When the field of comparison is enlarged from mines to whole districts the divergence of evidence becomes tenfold emphasized.

In matters like these the experience of each mining engineer is a personal equation by which every theory must be eventually tested. Out of the whole of the sad wreck of glittering generalizations on this particular subject, only one or two have survived my own particular trial of them, and even they, I fear, await the destructive testimony which may at any moment be found in the development of new mining regions. When gold occurs in pyrrhotite ores it has been as yet invariably proved to be in immediate association with a small, often overlooked, percentage of copper pyrites. The testimony of Montana, Colorado and British Columbia is as in this deduction. Again, while many veins carrying coarse gold encased in white quartz persist to great depths, and in this respect Bendigo does especially set at naught the dictum of American experience, nevertheless I have not known gold quartz to be persistent wholly barren of the sulphides of the baser metals, while, on the other hand, I do remember innumerable examples of ore quite destitute of pyrites, galena and blende which proved particularly short lived. I might venture one other. I know of no better indirect evidence of the size of a body of gold ore than uniformity in the distribution of the gold. A patchy occurrence is less likely to indicate continuity or size than homogeneity; samples which vary between narrow limits are more encouraging than those which swing between wide extremes of richness and poverty. It is with a desire to avoid a merely destructive attitude that I have dared to offer these three observations.

While, therefore, the evidence in support of the value of the supposed indicative minerals is, as we have seen, of a very contradictory nature, it has also another feature which must not be overlooked. At its best the aid of these minerals would be delusive, because, even if it proved the invariable association of gold with particular minerals, it could not predicate the actual amount of that gold. That a lode should carry gold is quite insufficient to the mining engineer, whose operations for its successful extraction require that it should be there in paying quantity. This is the difference between science and business. The union of the two creates an industry. One might discuss in a learned and entertaining manner (as Stelzner has done) the suggestiveness of the association of gold with such a compound as the silicate of boron and aluminum (tourmaline), because it indicates a deep-seated origin. The presence in notable quantity of the fluoride of calcium (fluorspar) might prompt speculations of a vaporous and corroding kind. But the proof of gold having either a profound or gaseous origin, were it attained by the geologist or chemist, would not permit the mining engineer to infer that the gold persists in paying quantity to any particular depth. An ore which carries two penny-weights per ton in a region where the conditions are such as to require the equivalent of fifteen penny-weights to be expended in the extraction and reduction of a ton of it is to all practical intent as valueless as one which is wholly barren.

The question of indicative minerals bears many points of resemblance to that of the plants which have been observed to distinguish the soil enriched by particular ores. The *Viola lutea* was supposed to be peculiar to the soil covering the zinc deposits of Westphalia, and was subsequently recognized growing on the outcrop of the zinc ores of the Horn silver mine in Utah. It became known as the "zinc plant." Similarly there is a so-called "lead plant," the *Amorpha canescens*, which characterizes the deposits of Michigan, Wisconsin and Illinois. These plants are varieties of widely distributed specimens rather than a distinct species, their color being affected by their absorption of the particular metallic ingredient in the soil. Their occurrence has long ceased to have anything more than academic interest.

If, then, we cannot accept the belief that certain minerals are indicative of the plentiful occurrence of gold, what shall be said for the idea that they give an assurance of persistence in depth? Every one has read serious statements to the effect that this or that mine was of undoubted value, because its ores contained particular minerals, the presence of which promised that the vein would increase in richness in depth. In young mining regions such ideas find a fertile soil. In West Australia the finding of tellurides in an ore is now generally considered to permit of the inference that the lode will go down to a great depth. The early discoveries of extraordinary pockets of native gold in veins of white quartz, such as the famous Londonderry, having proved sporadic and bunched to a distressing degree, therefore, when the telluride ores of Kalgoorlie became recognized, and were found to occur in bodies of magnificent size and very satisfactory

persistence, then the conclusion was jumped at that if tellurides were only present in an ore continuity in depth became thereby guaranteed.

In these matters a very small portion of ascertained truth is swamped amid a mass of supposition quite unworthy of the name of theory. A theory embodies an underlying principle of universal application. The idea which to-day dominates the mining of West Australia is a vain imagining, delusive as a promoter's dream.

Those who are acquainted with the history of the mining of tellurides need not be told how ill founded is the statement that these particular minerals characterize lodes of peculiar permanence. The combinations of tellurium with gold and silver have proved of notable commercial importance in three mining regions—namely, Transylvania, Colorado and West Australia. There are other districts where the mining of them is an incident in the working of ordinary gold ores. Such is the case in certain localities in California, South Dakota, and the North Island of New Zealand. In none of these, however, have they been indicative of any special persistence in the richness of the veins, and their occurrence has been merely an added obstacle to the successful extraction of gold.

It was in 1802 that Klaproth discovered the presence of a new element, tellurium, in the ores of Zalathna, and so led to the recognition of a large number of the compounds of that metal with gold and silver. Zalathna, Nagyag and Verospatak were gold mining centers when Transylvania was the Roman province of Dacia and ruled by Trajan. Their very complex ores have been a puzzle to the metallurgists of many generations. The veins penetrate young volcanic rocks (such as porphyry) and tertiary limestones, sandstones and conglomerates. This very ancient mining country exhibits to-day a very forceful example of impoverishment in depth, while the refractory character of the ores has tried the resources of the smelting establishments of Schemnitz, Zalathna and Freiberg.

In Colorado the tellurides were recognized as early as 1874 in Boulder county, more especially at the mines of Magnolia, Salina and Sunshine. An experience of nearly twenty-five years has proved to the miners of that district that these ores occur there in comparatively small bodies of remarkable richness, but of very irregular and uncertain behavior. In two other districts of the same State, viz., in Hinsdale county and amid the La Plata mountains, valuable mines, carrying rich ores in the tellurides of gold and silver, have been worked during the past ten years, but their record corroborates that of Boulder. There remains the more important gold field of Cripple Creek, where veins penetrating a remarkable complex of volcanic rocks have proved so persistently rich to a depth now approaching 1000 feet that they have obliterated the reputation which this class of ore won in the three older parts of the same State.

In West Australia tellurides are being mined in three localities—Redhill, Bardoc, Kalgoorlie—and the wonderful development of the last has given a new impulse to the whole industry of the colony.

Thus, one hears much of Cripple Creek and lately of Kalgoorlie. In both districts very rich lodes, characterized by telluride ores, have been opened up, with results so eloquent as to silence the story of the more numerous localities where these particular minerals have been only a metallurgical obstacle associated with ore bodies of no satisfactory continuity. As a consequence, investors are prepared to swallow the rhetorical confectionery of an irresponsible press, and to believe that a new era has dawned for any neglected region in which these tellurides have not been heretofore recognized. Believe me, the compounds of tellurium are far more widely dispersed in gold ores than is generally supposed. I have detected them in several mines when a low extraction in the stamp mill suggested an unusual difficulty in the ore, and it is certain that during the next few years the search for these minerals will lead to their recognition in so many unsuspected localities that they will cease to be a mineralogical curiosity.*

The idea, now very prevalent, that at Kalgoorlie especially the presence of tellurides guarantees persistent richness is contradicted by several facts, the most notorious of which should be that the very mine in which they should be first recognized (by Mr. J. C. Moulden, in May, 1896), and subsequently acclaimed by the local press as heralding sure prosperity, has proved unprofitable; indeed, the particular ore body in which the first telluride was seen has been demonstrated by later development to be an isolated patch leading to nothing of any moment. Moreover, the lodes at Kalgoorlie vary in the amount of tellurides, which they carry without a necessary coincident difference in their richness. The gold occurs not only in chemical combination with tellurium, but also in its ordinary native condition. Further, tellurides occur other than those which contain gold. The so-called "black tellurium" of certain mines is

*The sulphide ore of Mount Morgan, Queensland, carries tellurides. The fact was recently determined by Mr. E. S. Simpson, Government Assayer for West Australia. How much of the early troubles in the treatment of the oxidized ores is explained by this discovery? It also recalls to me the resemblance between the dull brown gold of some of the Mount Morgan ore and that of the first discoveries of Cripple Creek in 1892.

the rare telluride of mercury, called "coloradoite," from the locality of its first discovery. Native tellurium also exists. Again, some of the veins, even below the zone of oxidation, are so free from tellurium as not to differ from ordinary gold-bearing reefs. Yet there is no reason to suppose that these are less rich or persistent than those which are characterized by a notable percentage of tellurides.

It is not too much to say, therefore, that the observations gathered from the working of these ores in various parts of the world refute the idea that their occurrence has any particular bearing on the question of persistence in depth: while, on the other hand, experience has frequently demonstrated that their presence is an important factor from a metallurgical standpoint, because it increases the cost of gold extraction, the treatment of such complex ores being more expensive than that of those in which the gold exists in a free state.

(To be Continued.)

Steel Moulded Like Dough.

There are several firms in the United States now busy making steel projectiles for Uncle Sam's big rifles, but it is said that only in the Brooklyn Navy Yard is it possible to see steel—not what is technically known as soft steel, either—moulded like so much dough. Usually such projectiles are formed by cutting, and are then bored out to make a chamber for the explosive.

Both armor piercing and semi-armor piercing shells are made in sizes ranging from 6-pounders to 8-inch. The raw material is steel, partially hardened, in round bars from 2 to 8 inches in diameter. These bars are sawed into lengths varying for the different sizes of shells from about 4 inches to about 13 or 20 inches. The work of cutting up the steel bars is such as may be seen in any machine shop. But the next step is a surprise. Entering a great room which has a dirt floor, one sees about him fiercely hot furnaces and huge hydraulic presses. A solid cylinder of glowing white metal is carefully adjusted in the die of the hydraulic press that performs the first operation. The press operator pulls down a lever with an easy movement of one hand, and down comes the mighty mandrel, exerting a pressure of hundreds of tons upon the chunk of hot steel. When the mandrel is withdrawn the piece is automatically ejected from the die. It is now slightly conical in form, having been squeezed into this shape by the great pressure as easily as if it had been putty or dough. Immediately it goes to another of the great presses, where it is held in a die with the thicker end up. Here, when the mandrel has silently applied its force and been withdrawn, the piece shows a deep hole punched in the center and has taken a form roughly resembling the finished projectile. Without reheating, so rapid is the process, the shell now goes into a third press, from which it comes still more nearly shaped to the proper pattern, and a fourth forming operation makes it ready for the finishing room.

The shells are finished and trued in lathes. A rifling band of copper is welded on near the base. Around the nose of the full armor-piercing projectiles, a short distance from the point, a groove is cut. This is for a soft steel cap, which is put on by the Government when the shells are loaded. The cap serves to prevent the shell from glancing when it strikes obliquely, and also acts as a lubricant, enhancing its penetrating power.

HAVING analyzed the powder found in the pits, M. Olroy, a French engineer, gives in an article the results of his investigations in the pitting of boilers. He found that the powder contained 86.26 per cent of peroxide of iron, 6.29 per cent of grease and other organic matter, and 4.25 per cent of lime salts. He discusses the pitting of feed heaters, boilers, etc., mentioning the conditions under which pitting most frequently occurs. He also cites certain experiments in which a polished iron bar was first immersed in a natural water containing much oxygen, and no lime salts. The bar gradually rusted, but the corrosion ceased when the oxygen was used up. The bar was then removed, repolished, and put back, after which it remained perfectly bright. Repeating the experiment with water containing lime, the rusting was much less complete, the lime salts forming a protective layer on the iron, but on polishing this off corrosion recommenced. In distilled water the bar remained quite bright. The corrosion is much more rapid if the water contains carbonic acid gas as well as oxygen. In this case a voltaic action takes place. The rust first formed is electro-positive to the iron, which then dissolves away, decomposing the water. It is for this reason that in cases of pitting it is essential that all traces of the iron peroxide should be cleaned from the metal, or the rusting will continue.—Scientific Machinist.

TRAUTWINE states the melting point of steel as being 2370 to 2500° Fahr., and iron as being 3000 to 3550° Fahr., but Greenwood gives the following temperatures, Fahr., approximately, for both iron and steel: Incipient redness, 977; dull red, 1292; cherry red, 1652; deep orange, 2012; white heat, 2372; dazzling white, 2732 to 2912.

Coast Industrial Notes.

—Flagstaff, Arizona, has contracted for water works to cost \$5,000.

—Eastern fruit shipments from Sacramento, Cal., the past eight days exceed 170 carloads.

—For the fiscal year ending June 30th 2274 immigrants landed in San Francisco, bringing with them \$214,520.

—I. D. Applegate, in Klamath county, Oregon, sheared 21,000 pounds of wool from 2700 head of sheep.

—Tails of Kero Co., Cal., ground squirrels are worth two cents each delivered to the county supervisors.

—The bark Palmyra is at Unga, Alaska, with the first cargo of coal ever taken from Australia to Alaska.

—Mr. Dole of Honolulu, U. S. A., has signed a contract with the Scrymser Co. for a cable thence to San Diego, Cal.

—Now that Hawaii is annexed, no vessel flying a foreign flag can do business between this coast and the islands.

—Oregon lumber is leaving for the East at the rate of 150 M. feet per day from the various lumber mills of Portland.

—The Postal Telegraph Co. has bought the Rocky Mountain & Postal Telegraph Co. and will operate it as a part of its system.

—The drouth has sent southern California cattlemen into the Yosemite park, from which they are being ejected by U. S. officials.

—Surveyor-General Blair reports a notable shrinkage in the applications for U. S. mineral surveys since the new rule governing patents went into effect.

—The Crow's Nest Pass Railway, B. C., is completed to Elk river, and it is expected that by the middle of October traffic will be possible from McLeod to Rossland.

—Heldmair & New, Chicago contractors, have the contract for the construction of the breakwater at San Pedro, Cal., harbor. It is thought now that active work will soon begin.

—At Grays harbor, Wash., there is a scarcity of labor. Sawmills are paying \$1.50 per day for men. There is room for 100 laborers in the mills at the harbor at steady employment.

—The Wellborn-Seaver E. Co. will build a plant for the manufacture of steel at Chihuahua, Mexico. The iron ore from the Cerro de Mercado mine at Durango will furnish the raw material.

—Chas. Fair claims to have successfully experimented with a plan to manufacture illuminating gas, for use in San Francisco, of 35-candle power, at a cost of 30 cents per M cubic feet, from garbage.

—From the Columbia river, during the year ending June 30, '98, \$890,589 cents of wheat valued at \$12,197,762 were exported. Exports of flour for the same period were 907,891 barrels, valued at \$3,610,707.

—June shipments of redwood lumber from coast ports were 14,000 M. feet, a falling off of 3000 M. feet for the same month last year, and for the half year ending June 30th a decrease of over 11,000 M. feet.

—At Fresno, Cal., the drouth affects the San Joaquin Electric Co.'s long distance transmission plant, which is barely able at present to furnish power or light on account of scarcity of water in the San Joaquin river.

—The Lingham T. & Co., of Johannesburg, South Africa, has ordered 2000 M. fir lumber for Delagoa Bay from Pacific coast mills. This company has shipped 30,000 M. lumber from Puget sound and B. C. to South Africa in the past nine months.

—The fourth ocean log raft built by H. E. Robertson at Stella, on the Columbia river, Wash., has started for San Francisco. It scales between 6,000,000 and 8,000,000 feet, is 600 feet long, 63 feet beam, draws 20 feet of water and is cigar-shaped. The raft is insured.

—The Melrose, Cal., works of the Western Fuse & Explosive Co. were on the 19th blown up by a Chinese murderer who had secreted himself in the magazine which he exploded on the approach of the county peace officers, killing himself and six others. The loss aggregates \$50,000.

—The annual report of the surveyor of the port of San Francisco shows that in the year ending June 30th, '97, there were 813,602 tons of dutiable goods imported; in the same time in '98 there were 977,868 tons. The increase in exports is larger. In '97 there were 11,824 tons of dutiable goods, and 54,964 in '98.

—The projected contract between the Spreckels sugar refineries and Los Angeles oil producers for the daily delivery of 500 barrels of oil for a year has fallen through. The price named was 8 1/2¢ a barrel f. o. b. Los Angeles. Oil is now \$1 per barrel, spot delivery. Southern California's present San Francisco shipments average 15,000 barrels monthly.

—Illustrating how war augments expenses, an officer of the Atchison, Topeka & Santa Fe says that it will cost the company \$25,000 a year for revenue stamps on checks in paying employees. The company contemplated running a pay car and paying in cash, which was the custom throughout its lines until a year ago, but it has been decided to continue paying by check.

—The Oregon Short Line has made a contract for 15,000 tons of 70-pound steel rails to be delivered in October to be laid on the west end of the main line, which will practically complete the laying of heavy rails on the entire line from Granger, Wyo., to Huntington, Or. The company has on hand 550 miles of 52-pound rails piled along the road, which was replaced by the new steel. This is enough to lay track from Milford, Utah, to Manvel, Cal., including all switches, spurs and side-tracks, and a branch to Pioche, Nev., and one

to St. George, Utah, should such a road be built. Manvel is the northern terminus of the California Eastern, which connects at Blake, Cal., with the Santa Fe.

—At the Great Northern tunnel at Wellington, Wash., the tunnel is in about 600 feet at both ends. Three shifts employ 150 men. Wages range from \$1.50 to \$2.75 a day, board \$4 a week. Trouble is experienced in getting men because of the wages. Men who get \$1.50 a day have very little after they have paid board and for necessities of life.

—At the Union Iron Works, Potrero, San Francisco, the Farragut was launched last Saturday. She is the first torpedo boat destroyer built on this coast, 273 tons, contract price \$227,500, speed thirty knots, vertical triple expansion engines driving twin screws, length on the water line 210 feet, beam 20 feet, draught 6 feet. The boat is unarmed. She will carry two torpedo tubes and a battery of six pounders.

—The California cereal year ended the 30th ult. During the year there were exported from the State 9,922,021 cents of wheat, valued at \$15,005,713, and 832,030 barrels of flour, valued at \$3,600,686. The exports of barley were 2,932,792 cents, value, \$3,474,274. The total California crop of wheat is estimated to have been 1,865,642,000 cents. The wheat and barley crops of this year will be less than half the above.

—W. A. Bissell, assistant freight traffic manager Atchison, Topeka & Santa Fe, says: "The Santa Fe expects to enter the field of Asiatic commerce in competition with other lines. We are to have a line of steamers to the Orient running out of San Diego by Oct. 1st. We want some of the business that has been so profitable to the northern lines. We believe that there is room for another line between the Pacific coast and the Orient."

—The Pacific Coast Metal and Hardware Association held its fourth annual convention in San Francisco last week. Brace Hayden, president; W. Honeyman, first vice-president; C. C. Reynolds, second vice-president; Wm. Schaw, third vice-president; J. F. Merrill, treasurer; F. L. Brown, Secretary; W. C. McCloskey, assistant secretary; Executive Committee—W. R. Wheeler, A. A. Watkins, Wakefield Baker, E. F. Selfridge, A. L. Scott, C. F. Fay, A. A. Wigmore.

—From custom-house returns of a table showing the business of the Puget Sound collection district for the fiscal year ending June 30, 1898, exports and imports for the year aggregate \$23,008,991, the principal articles of export being 8,023,912 bushels of wheat, 615,155 barrels of flour, 130,168 M. feet of lumber and miscellaneous merchandise, shipped principally to China and Japan, valued at \$7,952,046. There were 1624 entrances and 1868 clearances in the district, with a total tonnage of 2,233,532.

—Vessels of the revenue fleet are to be equipped for patrol duty along this coast. Lieutenant Commander Mozier of the Albatross will be at the head of the fleet. The vessels under his command will include the Grant, the Corwin, the Rush and the Perry. The Corwin is now at San Diego and the Perry is on the Columbia river. These vessels will be supplied with new rapid fire guns and some of them may ultimately be sent to the Philippines for revenue work or scouting duty.

—As noted in last week's issue, a Pittsburgh, Pa., firm got the contract for the structural steel work of the new postoffice building at San Francisco. The bids were as follows: Stewart Iron Works, Cincinnati, \$179,990; Ed T. Jones, San Francisco, \$176,115.87; Risdon Iron & Locomotive Works, San Francisco, \$174,875; San Francisco Building Co., San Francisco, \$174,875; City Street Improvement Co., San Francisco, \$166,000; I. G. Wagner, Milwaukee, Wis., \$164,400; McGuire & Hall, New York, \$166,498; Thomas Marshall, Pittsburgh, Pa., \$154,615. Marshall promises to have the work completed by March 1, 1899.

—On Sept. 6th, '98, there will be nearly 1,000,000 acres of land in southern California thrown open, subject to entry in the United States Land Office at No. 317 New High street, Los Angeles. This land has been held by the railroad company and its assigns, but now reverts to the United States government. This section takes in a majority of the odd-numbered sections of land, reaching from a line extending east and west north of Pasadena and extending north to the Tehachapi mountains, except the Government timber reservations and the Mexican grant lands. Those sold to bona fide purchasers will be acquired by said purchasers as soon as they have filed proofs after Sept. 6th and paid \$1.20 per acre. There is an uncertainty about getting back the money paid to the railroad. Homesteaders are limited to 320 acres of Government land. Purchasers of railroad land are not limited except to the amount previously contracted for. Alien holders of railroad lands cannot acquire title. The holdings of such aliens will be open to entry by citizens as homesteads or desert claims.

—R. G. Allen, vice-president and Western manager National Association of Manufacturers, who has been traveling through Mexico, writes *Iron and Steel* that Americans sell the greater part of the modern mining machinery used in Mexico. The machinery for all the new smelting plants, which have a capacity of about 4000 tons per day, was sold by Americans. Stamp mill machinery is nearly exclusively American made, and it is only in Chilean mills and similar classes of triturating machinery that American houses have found serious competition. England and Germany furnish a large part of the machinery of this class and a great many stationary steam plants. Steel for stamp mill shoes and dies, for Chilean mill tracks and tiers and for mining purposes, is imported largely from England. Explosives are exclusively American. There is but little illuminating material imported for mining purposes,

the cheapness of tallow and the oils extracted from the many oil beans indigenous to the country supplying this want. A few American candles, however, have been imported recently, and there is a good prospect for increasing this trade. Sulphate of copper until a few years ago came almost exclusively from England. For the past five years New York has furnished the greater part of this material, and within the last few months the Kansas City Smelting and Refining Company has been making heavy shipments to Pachuca and other mining centers.

—City of Mexico advices are that the Grande Mexicano del Sur is an assured fact. The entire route has been surveyed from the Tehuantepec to the Suchlate, on the Guatemalan border, and work will soon begin. The concession for the canal was granted last December to Bolanos & Leroy, and carries with it a subvention of \$5000 per kilometer, which is to be taken out in public lands at the rate of about \$1 per acre. The course of the canal is generally parallel with the Pacific coast at a distance of from one to twenty kilometers and from twenty to thirty kilometers from the coast range of the Sierra Madre. The ports along the route are really unfit to admit but the most shallow draught boats. The first port entitled to the name southeast of Acapulco is Puerto de Ocos, in Guatemala. The general height of the mountain range opposite the course of the canal is from 1000 to 2500 meters, although there are a few peaks which run considerably over this. By the terms of the concession the concessionaries are granted seventy-five meters on each side of the canal, and they have the right, with the customary legal formalities, to condemn, appraise and appropriate to their uses the right of way through all lands that the canal may pass. They also have ten years' time in which to build the canal and ninety years' privilege to free use of all game, fish, salt, etc., on all the islands and public lands on the route of their canal. The canal will be two meters deep, twelve meters wide at the bottom and fifteen meters on the surface of the water. It will be 440 kilometers long in that section which passes through Mexican territory, of which about one-fourth will be in the State of Oaxaca and three-fourths through the State of Chiapas. It starts at the station on the Ferrocarril Nacional de Tehuantepec at the City of Tehuantepec. There will be flat-bottomed boats for passenger traffic, propelled by electric motors. These boats will tow the freight barges, of which there will be about 100, of from 50 to 100 tons capacity each.

—The currency of that part of our national domain lying within the limits of the Hawaiian islands is of the same unit of value as that of the rest of the United States. The gold is all of American mintage, and United States silver and paper money is in circulation and passes at par. The Hawaiian money is paper, the paper being secured by silver held in reserve. Banks keep two accounts with their depositors, silver and gold, and checks are so worded that the depositor may specify the account from which the check is to be paid, though in case the check does not state in what currency it is to be paid the law provides that the holder may demand gold if the amount is over \$10. The Hawaiian silver money amounts to \$1,000,000, of which \$300,000 is held by the Government to secure a like amount of paper. The total amount of money in circulation is estimated at \$3,500,000. The rate of exchange is 1 1/2 per cent on Eastern cities of the United States and 1 per cent on this coast. Gold is at a premium of 1 per cent. The annual internal taxes average \$6.48 per capita; the total revenue from all sources, \$2,283,070 (in 1896); expenditures, \$2,137,103, and the public debt, \$4,101,174, bearing interest at 5 and 6 per cent. Commercial travelers are, under the law now in force, required to take out a license, costing at Honolulu for the island upon which it is located \$570 and on each of the other islands \$255. The market for all kinds of labor is overstocked. Wages on the plantations, including house and firewood, or room and board, range from \$125 to \$175 per month for engineers and sugar boilers, \$50 to \$75 per month for blacksmiths and carpenters, \$40 to \$75 per month for locomotive drivers, \$100 to \$175 per month for bookkeepers, and \$30 to \$40 per month for teamsters. In Honolulu the rates are \$5 to \$6 per day for bricklayers and masons, \$2.50 to \$5 per day for carpenters and painters and \$3 to \$5 per day for machinists. Retail prices of provisions are: Hams, 16 to 30 cents per pound; bacon, 16 to 20 cents; flour, \$2.50 to \$5 per 100 pounds; rice, \$3.25 to \$5 per 100 pounds; butter, 25 to 50 cents per pound; eggs, 25 to 50 cents per dozen; ice, 1 1/2 cents per pound. The productions of the islands are almost entirely a class of articles for which the people of the United States have in the past been compelled to send money outside of their own borders. Sugar, coffee, tropical fruits and rice, for which we send abroad more than \$200,000,000 annually, are the chief productions of the islands, and while the quantity so produced amounts to less than one-tenth of this sum, it is believed that it may be materially increased and to this extent our expenditures for this class of article be, in the future, kept within our own borders and among our own people. Of sugar, of which it is said the Hawaiian islands are much more productive in a given area than those of the West Indies, the exportation increased from 294,784,819 pounds in 1895 to 520,158,232 pounds in 1897, and for 1898, will, it is expected, be considerably in excess of last year. Of coffee the exportation increased from 3051 pounds in 1891 to 337,158 pounds in 1897; of rice the exportation increased from 3,768,762 pounds in 1895 to 5,499,499 in 1897 in pineapples the increase was equally striking. In the matter of imports, as above indicated, nearly all of the necessities of life, aside from sugar, fruit and vegetables, are imported, the products of the United States being given the preference in nearly all cases.

Personal.

T. J. HOUGHTON is Supt. Lightner mine, Angels, Cal.

W. D. PINKSTON is Supt. Three Stars mine, Auburn, Cal.

J. MIRON is appointed Supt. Manora M. Co., Silver City, Utah.

O. S. BUCKBEE is Supt. Sheep Trail mine, Fort Mojave, Ariz.

J. QUINN, a mine owner from Bisbee, Ariz., is in San Francisco.

A. N. BUTTS, owner Bovee mine, Angels, Cal., is in San Francisco.

CAPT. J. R. DELAMAR sailed from New York this week for France.

J. DAGGET of San Francisco is at his Black Bear mine in Siskiyou Co., Cal.

RALPH NICHOLS left Silver City, Idaho, for Kalkorlie, Australia, last week.

A. C. CURTIS of the Mercur mine, Mercur, Utah, has returned from Wisconsin.

A. D. FOOTE, Supt. North Star mines, Grass Valley, Cal., is in San Francisco.

L. L. MYERS, Supt. Malakoff mine, North Bloomfield, Cal., is in San Francisco.

W. H. SUTHERLAND of London, England, is visiting his mines at Grizzly Flats, Cal.

C. A. BATTERMAN Supt. Anaconda mines, Anaconda, Mont., is at Placerville, Cal.

E. H. WEBSTER becomes Supt. Grand Central mine, La Colorado, Sonora, Mexico.

JAS. W. ABBOTT has returned to Grants Pass, Or., from the Mt. Ruben district.

PROF. ARTHUR LAKES of Denver, Colo., is in California studying the mining situation.

W. T. ROBINSON, Supt. Spanish Bar mine, Mokelumne Hill, Cal., is in San Francisco.

J. D. KIEFFER of the Herschel mine, Mercur, Utah, has returned from his Eastern trip.

M. SPROAT has been appointed gold commissioner for the Slocan, at New Denver, B. C.

J. M. PHILIPS, Supt. Amador Queen No. 2, Jackson, Cal., has returned from Toledo, Ohio.

J. A. FERGUSON, Supt. Red Point mine, Damascus, Cal., has returned from San Francisco.

H. K. SHOCKLEY, Supt. Phoenix mine, Nevada City, Cal., has returned from Cincinnati, Ohio.

P. L. SCHUMAN, Supt. North Star Con. M. Co., Mokelumne Hill, has returned from San Francisco.

S. C. WILMANS, Supt. Boulder mine, Shingle Springs, Cal., has returned from San Francisco.

D. D. FINDLEY has been appointed Gen. Mgr. Gold Sovereign properties at Cripple Creek, Colo.

LETON BALLIETT, Mgr. Van Avery mine, has returned to Blue Canyon, Cal., from Des Moines, Iowa.

F. W. PAGE of San Francisco is visiting the South Fork mines, of which he is Gen. Mgr., at Forest, Cal.

E. A. STENT, managing owner Griffith Con. mine, Diamond Springs, Cal., has returned to San Francisco.

F. SEARLES, a mine owner and mining attorney of Nevada City, Cal., has returned from San Francisco.

J. GUKER, owner of the Great Northern mine, Baker City, Or., has returned home from Salt Lake City.

LOUIS RUEL and LOUIS FADE of the Roessler & Hasselacher Chemical Co. of New York are visiting San Francisco.

T. J. PARSONS of San Francisco, Vice-Pres. Cal. State Miners' Association, is visiting his mine at Alleghany, Cal.

F. W. BRADLEY of San Francisco, Mgr. Bunker Hill & Sullivan M. Co., is in London, England. He will return in four weeks.

C. B. WINGATE of San Francisco has returned from the Chloride and Bailey mines, in which he is interested, at Dedrick, Cal.

H. L. BENNER has resigned as Supt. of the Geyser-Marion mine, Mercur, Utah, to develop properties in which he is interested.

W. J. ADAMS, E. M., of San Francisco is at Ackerman, Placer Co., Cal., examining a quartz property for Messrs. Brandenstein & Jacoby.

W. R. CHADBOURNE, Gen. Mgr. Mikado mine, Leadville, Colo., is at the Lindsay mine, Maybert, Cal., which his company is exploiting.

C. H. THOMPSON, interested in the recent purchase of the Virtue mine, Baker City, Oregon, becomes Gen. Mgr. of the Virtue and Collateral mines.

H. KERNER of St. Louis, Mo., Pres. Lucky Marion G. M. Co. of Greenwood, Cal., is visiting the mine and says work will soon be resumed on the property.

W. H. ANDREWS, managing director Young America M. Co., Tuscarora, Nev., is en route to San Francisco from Salt Lake City. He comes to procure plans and prices on a mill for his properties.

D. H. JACKSON of Placerville, Cal., has been offered his wholm position as Supt. Holmes mines, at Candelaria, Nevada, properties that were extensively operated before the decline in silver.

WM. SCHAW, senior member of the firm of Schaw, Ingram, Batchelor & Co. of Sacramento, Cal., has gone to London to bid on the contract for making and laying the 323 miles of 30-inch riveted iron pipe for the Coolgardie, Western Australia, water system.

Aug. J. BOWIE of San Francisco returns on the Roanoke from Dawson City, whither he went last July, representing Jas. R. Keene of New York, at an annual salary of \$25,000. Mr. Bowie, who is leading authority on hydraulic mining, confirms the estimate of the country given in his first correspondence while there.

Mine Legislation and Inspection in the Anthracite Coal Region of Pennsylvania.

An address delivered before the International Mining Congress at Salt Lake City, Utah, July 9th, 1898, by G. M. WILLIAMS of Scranton, Penn., and specially reported for the MINING AND SCIENTIFIC PRESS.

The history of governmental inspection of mines in the United States begins in the anthracite coal region of Pennsylvania, in the year 1870. Mining laws had then been in force in England since 1842. At each of the anthracite collieries a large structure, termed a "breaker," from 80 to 100 feet high, and containing about 800,000 feet of lumber, was required to break, assort the different sizes, and prepare the coal for market. Prior to 1885 these breakers were generally erected directly over the opening through which the coal was hoisted out of the mines, in order that the coal might be hoisted to the top of the breaker at one lift. On Monday morning, September 6th, 1869, at the Avondale colliery, at Plymouth, Pa., the breaker, which was erected over the shaft, was entirely consumed by fire while the workmen were in the mine. The shaft was the only opening and all the men in the mine, to the number of 108 persons, perished by asphyxiation. This, the first great calamity in the mines of this country, created a profound feeling of sympathy for the underground workers, and laid bare the great perils surrounding them. During the following winter, although a strenuous opposition was presented by a few operators, the legislature enacted a law regulating the operation of coal mines, with the laudable object of providing a greater degree of safety to the employees. This law was approved March 3rd, 1870, and applied only to the mines of the anthracite coal fields. Seven years later, in 1877, after a successful operation of the anthracite law, another Act was passed, applicable to the bituminous coal mines. Since then, both laws have been improved several times, and nearly all the other coal-producing States have enacted laws with similar intent.

The salient parts of the anthracite law are: that competent persons shall be employed by the State to inspect the mines and see that the provisions of the law are complied with; that there shall be an accurate map made of the workings and kept at the colliery; that there shall be provided at least two openings into each mine, fitted with safe, available appliances for the escape of the persons employed therein; that there shall be provided at least an average of 200 cubic feet of pure air per minute for each person employed in the mine, divided into separate currents so that not more than seventy-five persons shall be employed in any one current; that all accidents shall be reported to the inspector and investigated by him; together with rules regulating the conduct of the employees generally, and providing for the punishment of those who violate the law.

At first considerable opposition was presented by some operators to provide the improvements necessitated by the law. It required a large outlay of additional capital to provide a second opening; to make surveys of the workings, from which maps could be made; to provide appliances of sufficient power to produce the large quantity of air required for ventilation, and to provide the many other improvements required by the law. These operators felt that it was an imposition of unnecessary expense, and an uncalled-for hardship, to be compelled to spend so much extra money on what, at that time, appeared unremunerative. However, under the persistent efforts and influence of the mine inspectors, the necessary improvements were gradually introduced. In a few cases the inspectors were obliged to appeal to the courts to compel operators to comply with the law. A few years of experience demonstrated that the money spent in making the required improvements proved to be profitable investments. Accidents, which were at all times expensive, became less numerous. The pow-

der smoke was swept away quicker; the workmen were no longer troubled with headaches, and were enabled to do more work, so that a greater amount of coal was produced per person employed. Previous to the passage of the law, anthracite mining was in many respects conducted in a crude and wasteful manner, and the operators were exceedingly indifferent as to the safety of the employees. There was no accounting for accidents, and no provisions whatever were made to prevent them, excepting such as were necessary for the production of coal. Only the best and most accessible seams were mined, and they were mined in an unskillful and wasteful manner.

The anthracite coal basins of Pennsylvania have peculiar features, presenting difficulties for mining that are rarely met with in bituminous coal fields. The coal measures lie in a series of detached, parallel, canoe-shaped troughs, with occasional projecting branches, and much complicated by numerous abrupt rolls, warping the coal seams into curiously curved surfaces, having dips ranging from the horizontal to vertical. The large basins have minor plications and anticlinals, diverging from the average trend of the main axes of the basins. In some places an anticlinal becomes an overturned flexure, having the coal seam folded directly back upon itself. The varying pitches, caused by numerous local basins, make it impossible to work a mine according to a previously arranged plan. The workings must be conducted in such a way as to be adapted to the conditions found as the work progresses. The coal seams vary in number in different basins, and at different points in one basin. In the deepest parts, from six to ten separate seams are found, varying from 1 to 24 feet in thickness, and aggregating a total thickness of about 90 feet of coal. Seams less than 3 feet thick are not yet mined. The coal seams lie alternately between massive, hard sand-rocks, and the softer shales, and slates. The basins are depressions lying directly under the valleys, and the hills and mountains separating them are anticlinals, where the red shale and conglomerates—the bases of the coal measures—are raised to the surface and denuded of coal. All the coal seams outcrop at different elevations on the sides of the valleys, and the axis of the synclinal of the coal basin lies nearly beneath and parallel with that of the depressed surface of valley. Some of the smaller basins are exceedingly narrow, with steeply inclined sides, meeting almost "V" shaped, at a depth of from 200 to 500 feet, and having the coal seam at the bottom folded upon itself, while the wider and larger basins attain a depth at their deepest points of 2400 feet or more, and embracing a number of minor basins and warpings having inclinations varying from horizontal to ninety degrees.

Prior to the enactment of the mine law of 1870, which first introduced a system of mine inspection, the mines were nearly all working the safest parts of the basins, within a few hundred feet of the outcrops. The top and bottom rocks were generally strong and safe, and little propping and timbering was needed. The seams, where opened, were of almost uniform thickness, and contained free coal of excellent quality, which rendered the mining comparatively easy, and required much less powder than the coal mined in later years. As compared with the mines of the present time, the dangers were exceedingly small, only a few of the mines having any explosive gases. Some of the most gaseous mines had to be abandoned, on account of the many lives lost therein, due to the inadequacy of the ventilation. A few of the mines had fans of from 6 to 12 feet diameter, and a ventilation of from 10,000 to 40,000 cubic feet of air per minute, and some perhaps a little more, but all the non-gaseous mines had little or no ventilation at all, the mines which were not provided with fans depending for their ventilation upon a small furnace under

a shallow upcast, a hanging grate, a steam jet, or upon natural conditions. These means or appliances for ventilating the mines, as can be readily understood, were very far from being sufficiently effective. The mines were not examined by fire bosses, as they are now, before the miners are allowed to enter each morning. Accumulations of explosive gases were removed by the dangerous practice of "brushing" or fanning it into the air currents, and frequently a body of gas was deliberately exploded in order to get rid of it. These practices were extremely dangerous and caused numerous accidents, but now all such practices are prohibited. Timber was furnished only on the surface, and miners would frequently run great risks to avoid going outside to cut their props and bring them in; but now props are furnished, already cut to proper lengths, to the miner in the mine. Employees were permitted to ride indiscriminately in crowds on top of loaded cars in slopes and shafts. All the men that could be packed on a shaft cage were hoisted or lowered at once, and the cages had no roofs or overhead cover to protect them. The discipline was generally loose, having but little regard for the safety of the employees. The employees were permitted to indulge in all kinds of dangerous, reckless practices. There were no records kept of the persons killed or injured, but the meagre accounts given for the first year by the mine inspectors, when all the casualties were not reported, and although the mines were then in the safest parts of the coal basins, show that only from 50,000 to 60,000 tons of coal was produced per life lost, and not more than from 15,000 to 25,000 tons per person injured, and that a large proportion of mine workers over forty years of age were afflicted with miner's asthma. Soon after the provisions of the mine law were put in force through the persistent efforts of the mine inspectors a gradual improvement was effected. The cages were provided with roofs, hand-rails and safety appliances, and no more than ten persons allowed to be hoisted or lowered at one time. The ropes were provided with bridle chains, and all examined daily, and no person permitted to ride on loaded cars either in shafts or on slopes. The operators also soon learned that money spent to procure the best and most approved appliances was money well spent. Larger shafts were sunk, providing upcasts having sectional areas of from 80 to 140 square feet. Where the entries (gangways) were only 8 or 9 feet wide, they are now driven, when practicable, from 12 to 14 feet wide, and the airways the same width. The air was invariably conducted through the workings of the whole mine in one continuous current, but now it is divided into from four to eighteen separate currents, or splits. The result is that, with the enlarged airways and a judicious system of splitting the currents, the quantity of air produced by a fan has been increased by more than four times. All the anthracite mines are now ventilated by fans, varying in diameter from 15 to 35 feet, the quantity of air ranging between 60,000 and 400,000 cubic feet per minute, according to the extent and need of the colliery. The dangers and difficulties have been increasing every year, as the workings penetrate the deeper parts of the basins. Carbonic acid gas is found in some mines in profuse volumes, while enormous quantities of explosive gases are evolved in other mines, entailing a much greater liability to explosions and mine fires. The more tender top rock, and heaving fire clay bottom also add greatly to the perils and difficulties. The quantity of powder used in the mines has also so increased that in 1897 about 9000 kegs, of 25 lbs. each, were consumed per day, or 1.5 lbs. per ton of coal produced. In addition to this quantity of common black powder, over 2,500,000 lbs. of dynamite was consumed in the driving of tunnels, sinking shafts, and driving passages in the coal where fire-damp feeders are strong. High explosives do not ignite the gas feeders so readily as the common black powder. Notwithstanding the difficulties attending the

mining have been so greatly increased, and the liability to accidents have been proportionately augmented, and that the old workings of the past forty years must be cared for, the quantity of coal produced per life lost has nearly doubled. In 1870 the coal produced, per death, was only 59,969 tons, while in 1897 it was 110,725 tons. The number of deaths per 1000 employees in 1870 was 5.601, and in 1897 only 2.83, showing that the rate of fatalities per 1000 employees is reduced proportionately to the increase of the quantity of coal produced per death. The coal producing capacity of the mines has more than trebled for the same number of collieries. In 1897, working less than half time, 46,947,354 tons were produced, valuing \$176,052,577, and 95,812 persons were employed in the mines and 53,745 on the surface, making a total of 149,557 employees. Although the best and most approved machinery is used, the risk is greater in large producing mines than in the small ones, because everything is operated quicker.

The office of the mine inspector was created for the purpose of securing the enforcement of the laws enacted, to reduce the number of casualties in mining; but, in order to bring about this result, the mine inspector had to become an educator to a large number of mine foremen, whose knowledge of the principles of the various branches of mining was very limited. In traveling through the mines the mine inspector has been to a great extent, not only an instructor, but also a conveyor or transmitter of information concerning improvements. He has greater opportunities than any other official. He sees and notes the various appliances in use at all the mines he visits, and his suggestions are very frequently the means of bringing about the adoption in certain mines, where applicable, of improvements similar to those which have been made and used successfully in other mines. His position is by no means a sinecure, for he is called out at night, as well as during the day, when troublesome accidents occur, and has to assume the responsibility for the subsequent proceedings. Each inspector has about sixty collieries to inspect, and they are large, complicated and dangerous mines. He must keep himself well posted as to the workings, in order that he may suggest improvements tending to enhance the safety. The inspectors of the anthracite region of Pennsylvania are all practical men, who had been for years in charge of mines before being appointed to the office of mine inspector. They are not in any sense politicians, and did not receive their appointment through any political influence. They are commissioned by the Governor of the State, on the recommendation of a board of examiners appointed by the judges of the courts having jurisdiction. The board of examiners consists of two reputable mining engineers and three reputable coal miners in actual practice. The Governor has no choice in the selection of the mine inspectors, but must appoint the one recommended in each case. Some of the inspectors have been in office for twenty years. The inspectors are commissioned for the term of five years, but, after becoming proficient in the work and familiar with the mines in their district, it is not thought prudent to make changes, as long as an incumbent behaves himself well and attends to his duties.

ONE of the methods of testing the question of the existence of a perceptible atmosphere on the moon is the observation of a star at the instant when it disappears, or emerges from behind the moon. If there were a lunar atmosphere it should produce some effect on the appearance of the star. No such effect has ever certainly been observed. Recently this method has been rendered more delicate, perhaps, by the application of photography. Photographs of stars, made as they are about to disappear behind the lunar disk, show no indications of change in the intensity of the image, such as would be expected to occur if the moon had a perceptible atmosphere.

Mining Summary.

CALIFORNIA.

Amador.

Jackson Exploration and Development Co.: Extract from manager's reports of work done from May 7th to June 4th—Car-track laid and air-pipe fixed, power transmission rope replaced where broken, timbers framed and put in place for rope pulleys, eleven sets of old timbers taken out of 500-foot drift No. 1 and eleven sets of new put in their place. Part of hanging-wall drilled and blasted for entrance to station. Lower reservoir and ditch at Amador gold mine being cleaned out; 500 feet of 1-inch air pipes disconnected and taken out of shaft from 500-foot level down and replaced by 500 feet of 3-inch casing. Mr. Dye had consulted Mr. Ross (consulting engineer) with regard to sinking to a greater depth than 1000 feet. Mr. Ross said that no possible mistake can be made on the mother lode by sinking. His experience had taught him that it was next to impossible to go too deep—the deeper the better. He advised that the ledge be first proved at 1000 feet, sinking the sump to 1080 feet at the same time, and if it paid at 1000 feet to continue sinking, utilizing part of the profits to pay for the extra depth sunk. If it did not pay at 1000 feet, he saw no reason why it should not, then to continue the sump from 1080 feet to 1100 feet and to test the ledge at the latter depth, but it would then be necessary to sink 75 feet or 80 feet below the 1100-foot level for a sump. Mr. Dye suggested that the sump from 1080 feet be continued to 1110 feet to admit of the skip being filled from the 1100-foot level, and that a small drift be run in at 1100 feet to prove the ledge at that depth. This would save the expense of sinking the extra 70 feet, if not required. Mr. Ross stated that at the Central Eureka mine, adjoining the South Eureka on the north (the latter mine adjoins the Kennedy also on the north), their shaft was 1100 feet down, the ledge was 18 inches wide, with two perfect walls, and the ore would average \$7 per ton. During the second week in May there was a delay of twenty-seven hours, caused by the breaking of the power transmission rope. As the rope had begun to give, Mr. Dye would have to procure a new one. No further sinking in the shaft was done during the week ending June 4th, as the station was commenced. Five feet from the hanging-wall of the shaft the ledge was cut into, pitching at an angle of between 70° and 75°, and accordingly it should be again cut through in sinking lower. Mr. Ross had examined the 500 south drift No. 1 and east crosscut on May 13th, and said that, as it looked as though the hanging-wall had been reached on that level, he should advise not to crosscut farther east at that spot, but to run south, as a little water was showing on that side, and water always follows the ledge. Before leaving on May 13th, Mr. Ross said that the mine looked more favorable than at any time previously. At the 500 west crosscut the vein was 23 feet 6 inches wide; and, although this ore had not yet paid to mine and mill, by Mr. Ross's advice Mr. Dye was continuing to drive the crosscut, not only to determine the exact width of the ledge, but also to ascertain whether any good ore was on the footwall—the same as existed on the footwall of the said ledge in the shaft at the time it disappeared in the hanging-wall. The ore taken out was being sent to the mill with that from the 500 south drift No. 2 for what profit could be made out of it. On May 25th ten stamps were started on ore from the surface crosscut with ore man working twelve hours. At the 500-foot south drift No. 2 the ledge had commenced to improve in appearance, and assays of a sixty-pound sample had showed from \$1.03 to \$4.13 per ton, or an average of \$1.64 per ton, which included all the values contained in the ore, but the ore got gradually poorer until it did not pay to send to the mill. On May 30th a drift north at the 500-foot level was started, nearly the whole mine north of the shaft being unexplored and virgin ground. After drifting 2 feet a two-assay ton test was made, the result being \$6.40 per ton, all values included. May 24—A four-assay ton test of an average sample taken from all over the drift resulted in \$2.53 per ton, all values included. All this would be sent to the mill. On June 4th the ore was 2 feet wide. In the before-mentioned period the Amador Queen mine, No. 1 shaft, was sunk and timbered 23 feet, making the total depth 1007 feet; the south drift No. 2, 500-foot level, was driven and timbered 46 feet 6 inches, making the total length 89 feet; the west crosscut, 500-foot level, was driven 4 feet 6 inches, making the total length 56 feet 6 inches. The north drift, 500-foot level, was driven 3 feet, and the station at the 1000-foot level was driven 12 feet. Number of tons of ore sent to the mill, 54, making a total of 132 tons; number of men employed, twenty to twenty-two.

At the Amador Queen No. 2 the rock is softening. The shaft is down 500 feet.

On the Spagnoli-Clinton the shaft is 1000 feet.

Dispatch: Mason & Griesbach at Pioneer are hauling 200 tons of rock from their mine to the mill and expect to begin crushing shortly.—Sullivan & Axtell of the Live Oak mine, Stony Creek, are having ten tons of rock crushed at the Good Hope mill.—The Oneida Co., Jackson, is having rock crushed at the Zeila mill. This is a test move and if it proves satisfactory a mill will be built by the Oneida people on their property.—At the Zeila repairing the shaft to go deeper on the ledge goes on. Rock is being taken from the present levels without interfering with repairing the shaft, and requisite stamps are kept dropping.—The Argonaut mill is kept busy night and day. The Supt. says that the mill will be kept at work unless the water supply gives out.

Ledger: The Jackson Exploration and D. Co. will sink 300 feet deeper before crosscut-

ting the ledge. A station has been cut at the 1000-foot level, ready for development work there.—The shaft at the Anita mine is down 600 feet. The owners will sink 1000 feet deep before prospecting the ledge.

Republican: Most of the repairing at the Kennedy is completed and soon all the stamps will be running.—At the Valparaiso mine the output continues satisfactory.—At the Red Hill mine considerable work will be done.—At the Christensen gravel mine six men are at work. The property pays a fair profit on the investment.

Butte.

In the Electric mine at Enterprise an 8-foot ledge of good ore was struck. It is said the company will put in a dam and erect a 5-stamp mill within a short time. G. H. Snow of Forbestown is interested in the property.

Clark Bros. near Yankee Hill are said to be taking out gravel that pays 10 cents per wheelbarrow.—Gramps Bros. have started work in their drift mine.—W. Lake is taking out pay gravel near Big Bend.

The Oroville Mercury says that litigation over the Cherokee mine at Cherokee has been settled by compromise and the mine bonded to C. W. Cross of San Francisco for six months, who in turn agrees to relinquish all claims against the company if he fails to make a sale within that time.

Marysville Democrat: It is said that the owners of the Gold Bank mine have bought or bonded the Carlisle claim and that Mgr. Stow will soon operate it. The Big Betay quartz mine is said to be developing profitable ore.

Calaveras.

(Special Correspondence).—The Gwin M. Co. has been notified by the Mokelumne Hill & Campo Seco Water Co., that they can furnish them but 80 inches of water this season. In consequence the Gwin Co. shut down on the 16th as this amount was insufficient to run the hoist. This, however, will be only temporary. The company has ordered a double engine of 250 H. P. which is guaranteed under bond to be shipped from the East within three weeks, and which it is thought will be in operation within six weeks. This shut down at this juncture is rather unfortunate, as the shaft had been completely unwatered only fifteen days and was beginning to pay. The company has broken through from the 1300-level of the new or North mine into the 1500 drift of the old mine about 7 feet above the floor, and made an upraise from the 1400-level of the new mine to the 1500 of the old property for air and drainage. The two shafts are 1100 feet apart.

Mokelumne Hill, July 18th, '98.

The suit of the Gerryman G. Co. against the G. M. & D. Co. has been transferred from Tuolumne to Calaveras county.

The Harris mine near Angels is to be worked, and on a large scale. The Cherokee mine near Altaville has completed the hoist and deep work will be pushed.—The Thorpe mine at San Andreas started up last week and the 10-stamp mill is working satisfactorily.—The Violet mine on Licking Fork is being worked by Goodman & Co. and showing good prospects. They have a pay chute which is said to average 2½ feet in width and yields about \$60 a ton, gold.

Prospect: Sinking and drifting are in progress in the Bonanza mine near Angels, the shaft having reached 175 feet depth. The vein will average 40 feet in width and the rock is of the same general character as that of the Utica. A general mill run yielded from \$250 to \$300 to the ton, the sulphurets producing an average of \$700 per ton.

El Dorado.

(Special Correspondence).—Referring to the item in last issue concerning the projected electric power plant, I am able to state definitely that if the franchise is granted the installation is a certainty. J. J. Crawford who applies for the franchise proposes to build in Ladies valley a cemented earth reservoir, 2000 feet of ditch and lay 4800 feet of 22-inch pipe 5-16 iron. The estimated cost of the plant is \$25,000. He has secured five acres of ground for power site and the right of way for a pole line through the Mebur & El Dorado Fruit Co.'s lands. He has also contracted with the Griffith Con. Co. for a long term of years to furnish water from Ladies valley under 1015 feet pressure, and to deliver to the Griffith Co. 250 H. P. to run their 40-stamp mill (now building), hoist and pumps. If the plant proves a success the Griffith Co. may accommodate their neighbors at a cost of \$7 per H. P. per month. It is possible though, if the enterprise is a success, that the Griffith may conclude to install a plant and supplement its present water power. Under the existing contract for pressure an inch of water is equivalent, theoretically, to 2.8 which would be decreased according to the efficiency of the wheels and loss of transmission. The successful inauguration of this power plant will make possible the resumption of work on several properties that were abandoned because of inability to secure water power.

Placerville, July 20th, '98.

At Pleasant Valley Murphy & Co. are running a 200-foot tunnel in a gravel property.—The Independence mine, at Slate Mountain, is showing good prospects in the extensive development work carried on by Croft & O'Brien. Marquart & Hancock of Granite Hill have completed the washing of 400 carloads of gravel from their mine during the past season and are blocking out new ground.

Nugget: The American Gravel M. Co., near Fort Jim, is running a bedrock tunnel to tap the gravel channel. Over 400 feet have already been driven. The company has 1200 carloads of gravel on the dump, taken from another portion of their mine, which they have been unable to wash up, owing to lack of water.—At the Starlight mine, near El Dorado, the shaft is being sunk from the 400-foot level an additional 100 feet. This company operate their 10-stamp mill by steam, but have been compelled to shut down, not having enough water for the batteries.—Searing and Dennis of the Abbott mine, near

Pilot Hill, are hauling ore from their mine to the custom mill at Placerville. A 75-foot shaft has been sunk and they are now drifting and breaking ore from a 2-foot ledge which assays from \$20 to \$195 per ton. The owners contemplate the erection of a steam hoist.

Nugget: In the Cammillite mine, near Shingle Springs, the shaft is 115 feet in depth. They are drifting from the 100 level on the ledge.—At the Limpensel mine near Placerville they are working on the 250-foot level. The vein is 15 feet wide; the shaft, which is 268 feet deep, will be sunk an additional 100 feet.—The Grand Victory mine, Diamond Springs district, has closed down on account of the drought. The mine will be allowed to fill with water. Operations will resume as soon as fall rains warrant.

Inyo.

The Inyo M. Co., composed of Pomona men, has begun smelting and is running through twenty-five tons of ore per day at the mine near Darwin.

Kern.

Four carloads of ore from Victor to the Barstow reduction works yielded seven ounces gold per ton.—A cyanide plant is in course of construction at Carlock to work the tailings of that camp. It is expected to handle sixty tons per day.

In the Yellow Aster group of mines at Randsburg the vein is 4 to 30 feet in width. There are a number of other veins. Some of the narrow veins show high assays. A mill of fifty stamps is running on ore averaging \$50 a ton, the bullion output having been \$40,000 a month since the beginning of the year.—The Wedge had a mill run of fifty tons of ore netting \$5038.

Los Angeles Review: The gold output of the Rand district the current year has been about \$400,000. The output for the month of July will probably be increased over that of the past three months, as the Yellow Aster Co. will have their usual amount of ore milled this month. During June the Eureka mill ran twenty tons of ore for the Merced mine, going \$70 per ton; twenty tons for the Napoleon, running \$100; twenty-five tons of Wedge ore at \$100; thirteen tons of Kinyon at \$150; forty tons for the Butte, running \$80 per ton.—The new 2-stamp mill at the Little Butte mine is running day and night on Little Butte ore. In this mine a seam was followed down 380 feet before gold was encountered; then a good ledge 3 feet wide was found.—During June the Johannesburg Reduction Works made a mill run for the Yellow Aster Co. amounting to \$20,000 and the Butte a \$7000 run.

Mariposa.

Tippett & Jones are developing the Blue Jacket mine at Hornitos.

At the Geary mine near Mariposa development work is pushed with encouraging prospects.

Merced directors in Boston say "it will be at least two months after the resumption of stamping before an assessment is considered."

Nevada.

Five stamps of the new 10-stamp mill at the Reddick mine near Nevada City have been started and the other five will also be crushing gravel soon.

A 2-foot ledge has been struck in the Texas mine near Nevada City which, on the 225 level, shows well in galena.—The tramway at the St. Gothard mine, North Columbia, is completed, and work on the new mill has begun.

Herald: The compressors and mill at the Brunswick mine near Grass Valley were started by electricity last week. The Electric Power Co. has installed two 80 H. P. motors and they work successfully. It requires something like 30 H. P. to run the mill and sixty for the compressors.—Twenty stamps are dropping at the Gaston Ridge mine near Graniteville.—Chinamen have purchased the bedrock of the Red Dog mine and are making a successful clean-up.—Forty men were temporarily dismissed at the Champion mine because of shortage of water and the mills are not running at full capacity.

Tidings: The Manzanita M. Co. near Nevada City will sell their mine and water right to the Texas M. Co.—Tributers at the Bellfontaine mine, Willow valley, took out ore that went \$16 to the ton, exclusive of sulphurets.

Placer.

A 353 H. P. turbine water wheel has arrived at the Pioneer. The Pioneer directors think that after the completion of the dam and the installation of the electric plant they can safely figure on \$10,000 monthly net earnings.

Plumas.

Independent: C. B. Wingate of the Thistle Shaft mine, as trustee, sold the Feather Fork G. G. property, the purchase being made by W. H. Chickering, on behalf of the Feather Fork Co. The bid was \$5000 for each of the two parcels in which the property was sold. This sale, we understand, was purely formal, the company being the purchasers. The sale places the property in such a shape that the Feather Fork Co. may conclude to resume work there in the near future.

San Bernardino.

S. S. Simon claims to have found a deposit of "fuller's earth" in the Tehachapi country. Fuller's earth of commercial value sells for \$20 per ton.

San Bernardino Sun: Work is about to be resumed at the Desert Queen mine, after a protracted period of quiet, both in court and at the mine.

Transcript: G. W. Sweesy of the Virginia Dale mining district took \$80 from a placer claim in four days.

Shasta.

The Gladstone mine, near French Gulch, employs twenty men. Good ore is being taken from the mine and the 20-stamp mill is running steadily.

The Devenney & Gray mill at Whiskeytown is running on good ore.—The Crowell mill is

crushing profitable ore.—The Bully Hill mine, at Copper City, is shipping ore in carload lots to the Selby smelter.—Levisohn Bros. of New York are having five shafts sunk on a copper property on Stillwater.

Sierra.

W. York has found a second ore body of good value in his mine near Downieville. He is pushing development of the property.

Siskiyou.

H. Barton in a cleanup from a week's work on Oak bar realized over two pounds of gold.—The Distelhorst & Barton dredger, working in the slough at Oak bar, has been taking considerable gold from the bedrock. The channel is rich at that point.—All the river claims in the Honolulu district are paying well this season.

Journal: The river miners at Sawyer's Bar are doing good work this season on account of the low water. They will all do better this season than usual.—The river miners on the Klamath from the headwaters to Happy Camp are hoisting pay gravel. Most of them are working day and night, and will have a long season owing to low water.—The Blue Gravel mine at Greenhorn is working a full force and is reported paying better than ever. The company has developed it on an extensive scale.

Trinity.

At the Wedge mine near Trinity Center the ore is roasted, then run through an arrastra, and nets \$54 a ton.

Tuolumne.

(Special Correspondence).—In the east belt the Grape Vine Canyon group of mines are working full-handed. Recent developments in the Lost Fox mine, one of the group, show a body of sulphurets assaying \$55 per ton, as found in the south tunnel in the 8-foot vein. There are two other mines belonging to the property, the Morning and Evening Star, aggregating in length 4500 feet; the Lost Fox, being the center one, is worked through a tunnel 7 feet high and 4½ feet wide, and has a shoot of ore 200 feet long, averaging \$10 in free gold and 6% sulphurets. There are now 90 feet of backs; when in 700 feet will have 900 feet from surface, owing to the steepness of the mountain side in which the tunnel is driven. Both walls in slate. Course NE and SW; dip to NW. Work is pushed on tunnel and sinking a double-compartment shaft on the ledge, down 400 feet. There is a free water supply from the Grape Vine Canyon creek, with 500 feet of vertical fall. There are eighty acres timber land, owned by the company, who intend to put in a mill. There are about 700 tons of rock on the dump. The office is in Nevada Block, S. F.; G. Burgin Pres., J. Stadfeldt Sec'y.

Sonora, Cal., July 20th, '98.

Banner: The Julia mine, near Sullivan creek, has been bonded to G. W. Kenny. The ledge averages 3½ feet.—The Golden Lion is being worked by Hope & Phillips. The vein runs from 20 inches to 2 feet.—The North Star, East Belt, is said to be producing some high-grade ore.

Independent: The quartz claims at Horse-shoe Bend are being developed by Stover & Shorey. One shaft is down 90 feet and another is 70 feet. The ore assays from \$5 to \$50 per ton and carries high-grade sulphurets.—Good rock has been struck in the Golden Rule.—At Columbia, Conlin & Ferguson have leased the Nate Arnold mine and have begun work.

Democrat: It is said that much gold is being taken out of the Bonanza, Sonora. Both in point of production and development it is a noted pocket mine.—The new hoist has been finished at the Mt. Jefferson.—Another strike is reported in the O'Hara pocket mine at Brown's Flat.—At the Arbona pocket mine is being done at present. The shaft is down 200 feet and a contract is to be let shortly for sinking 300 feet more.—The work of hauling the sulphurets from the Lady Washington mine to Summersville has been completed after a month's labor. All 5000 sacks are being shipped to Selby's.—A 2-stamp prospecting plant is to be erected on the Carlotia.—The first installment on the purchase price of the Providence mine, near Carters, has been paid. E. A. Wiltsee was the purchaser.

Yuba.

(Special Correspondence).—The Good Title mine at Indiana Ranch has practically shut down. There is an oft-told tale connected with operations on this property, and yet at the present time it deserves repeating. The company developing the property are wholesale merchants in Cincinnati, Ohio.

When the shaft had reached 160 feet depth, some of the company came out to see the property. Because they saw gold in the ore, and a mill run, too, showed good values, they immediately desired to build a 20-stamp mill. The Supt. urged that it were wiser to sink at least 200 feet more before building the mill. But he was informed that he was too cowardly. A mill was built. The Supt., who held an interest but who declined entering into a stock speculation, was offered an opportunity to sell his interest, which he accepted.

A young bookkeeper was sent on and made Supt. of the mine. He built a residence at a cost of \$2000 and put in \$1000 on furniture. The 5-stamp mill was enlarged and work continued a short time. The Cincinnati people are wiser but not wealthier out of this venture, and the entire property reverts to the original owners, from whom it was bonded, and who no doubt will now be able to demonstrate by depth whether they have a mine or not.

Dobbins, July 15th, '98.

NEVADA.

(Special Correspondence).—Searchlight district was organized yesterday. There are eighty locations, each one showing free gold. Our camp is reached via Manvel, Cal. Searchlight, July 5th, '98.

At Candelaria the Holmes Co. has completed a plant for the reduction of 4,000,000

tons of tailings, the product of forty stamps which worked for thirty years on the ores of Candelaria, principally those of the Northern Belle mine. Experiments justify the belief that 50 per cent of the value can be secured by amalgamation and concentration.

The Eira mine, at Tuscarora, is said to have a 10-foot vein of \$20 ore exposed on the upper levels. The Dexter of Tuscarora marketed the past year gold bullion and auro-cyanides of the value of \$124,669.78. During the same period the expenditures totaled \$216,834.64; a stamp mill was erected at a cost of \$45,902, water rights bought for \$34,000, a cyanide plant built and new ground bought; the shaft was put down 200 feet deeper and 2000 feet of drifting done upon the vein. Many new placers have been located on the Colorado river in the southern part of Lincoln county. The locations are not confined to any one place, but extend for miles above Temple Bar and below El Dorado canyon.

Ore shipments over the Eureka & Palisade railway last week aggregated 220 tons. The output of the Dexter mill in Tuscarora for June was \$25,000 in gold bullion.

The Picoche Record says that when the present additions to the tank capacity of the De Lamar mill are completed "the plant can get rid of 13,000 tons of ore a month."

Picoche Record: Good reports come from the Magnolia mine, at Ferguson district, over recent developments. When the ore chute was reached last summer in the main drift, the bulk of the work was spent in sinking on it in two or three places. A few weeks ago the main drift was started ahead again on a thin seam of high grade ore, which gradually widened, until now, at 50 feet, the whole face of the drift is in pay ore, 1 foot of which is high grade.

OREGON.

J. Savage is putting an extensive wingdam in Rogue river near Grant's Pass.

J. C. Young, who has extensive mining properties in the Cable Cove, has had 1600 pounds of ore sampled and the result is so satisfactory that he will make a large shipment immediately.

Baker City Republican: G. W. Grayson sold the Virtue mine to O. G. Larabee and C. H. Thompson.

Baker City Democrat: Mgr. Bamberger of La Bellevue mine at Granite says the reduction plant is soon to be enlarged to meet the demand of the large output of ore. The Risdon Iron Works of San Francisco is building on Rogue river near Grant's Pass, dredgers at a cost of \$35,000 for a company that has five others on rivers in California and Nevada. Three engines are required to do the work. One works the dredger, another pumps the water with which the gold is washed from the gravel and the third will operate an electric light plant on the boat, the operations being carried on day and night.

WASHINGTON.

(Special Correspondence).—In Eureka mining district, Colville reservation, Stevens county, the first discoveries of auriferous quartz, named drussite by Prof. Emmons, promised little of economic value at the surface, assaying 60 cents to \$3 per ton. Four feet of depth on the Republic claim showed rock assaying \$100 per ton and led to the organization of a joint stock company. Miners work from eight to ten hour shifts and receive \$3.50 per day wages. The manner of prospecting here consists in crosscutting the croppings and stripping off the surface. The pay ore runs in chutes and the values are not evenly distributed through the veins, hence development is necessarily slow. In addition to the Republic mine are the San Poil, Lone Pine, Pearl, Surprise, Little Cove, Quilp, Mountain Lion, Rebate and Tom Thumb, all showing big and well-defined ledges, with quartz largely exposed that will pay from \$6 to \$80 per ton. The main workings upon the Republic ledge are a shaft in the croppings, No. 1 tunnel, which enters the hill from the west side and penetrates the footwall, No. 2 tunnel, which enters the hill from the east side and penetrates the hanging wall, and a winze which connects those tunnels. All of the payable ore valued below \$100 per ton is reserved for home treatment. Several loads have been sent to the smelters yielding from 11 ounces in gold and 10½ ounces in silver. This mine is owned by the Republic G. M. & M. Co., principal office at Spokane, Wash. They have a mill with a capacity of twenty tons of ore daily, which may be increased to 100 tons, and are using a cyanide-amalgamation process. Owing to the microscopical fineness of the gold in the quartz, it will not amalgamate by the ordinary amalgamating process to save over 83%. Samples have given that, but the average results would be a saving of only 25% to 40%. Ore below \$50 of value per ton was successfully treated in the mill and the tailings showed a loss of only 6%; the general clean-up is expected to result in a saving of at least 90%. A third tunnel is now in about 400 feet and has about 2000 feet farther to run to tap the vein which it will intersect at 340 feet vertically below the No. 2 tunnel level and 560 feet below the surface. The mill process used combines the amalgamation of coarse gold with the dissolution by cyanide and precipitation by an electric current of the finer gold into a mercury cathode, the values being recovered as amalgam. In the case of the Republic ore, the gold is so fine as to require close crushing. A ball pulverizer is used, the pulp passing over a sixty-mesh jiggling screen. The finer material, 95% of which will pass a 100-mesh screen, is carried directly to the cyanide treatment vats.

Republic, Wash., July 18th, '98.

The Wheeler groups near Ryan are running a tunnel and are in 115 feet. The rock carries good values in copper and gold. The Grey Cliff is pushing work night and day. They are 130 feet in the lower tunnel and 165 feet in the upper, and the ore is improving in value. Seven men on the Jim Blaine tunnel at Republic are making about 4 feet in

twenty-four hours. The San Poil runs three eight-hour shifts and makes about 100 feet per month. The Blacktail Co. is drifting on the ledge, working three shifts. The ore is of good grade. S. H. Hayes of Spokane has an option on the First Strike claim on Toroda creek for \$8000.

Near Loomis the Golden Zone mine has a tunnel 400 feet on the ledge and employs fifteen men. The company is running two tunnels each 100 feet beyond the first. The ore will be stopped.

The company, composed principally of Pittsburgh people, has under consideration the manner of treatment of the ore. It is thought it will be by concentration and chlorination from which so far the best results have been obtained.

Supt. Lane has started a force at work on the Pocahontas mine at Republic. It has a ledge of about 5 feet. The Butte & Boston is making good progress. The drift is in 250 feet. In the Gold Bug mine at Garfield the tunnel is now in 220 feet on a 4-foot lead which assays \$52.50 per ton in gold and silver.

The Colwyn mine at Wallace is shipping two tons of ore per week and from the amount of ore on the dump the company expects to keep up this shipment until autumn.

Everett News: The Monte Cristo and Pride of the Mountains M. Co.'s properties were sold at receiver's sale this week to J. B. Crocker, supposed to represent J. D. Rockefeller.

BRITISH COLUMBIA.

The Velvet shaft near Rossland has been sunk 165 feet. The drifting, sinking and raising done at the Velvet is 1011 feet. On the Portland, owned by the same company, 118 feet of sinking has been done. About 55 per cent of the ore mined is second-class or concentrating ore, 15 per cent being first-class ore, the first-class netting \$15 per ton and the second-class produces 20 per cent of concentrates which give a net result of \$20 per ton. The ore shipments amounted to 256 tons, which was treated by the Trail and Nelson smelters. The Storm King mine near Sanca has 4 feet of mineral going from 4 to 20 per cent copper, forty ounces silver and some gold per ton. In the Big Four mine near Ymir a 20-foot wide ledge carries silver, lead and copper of good average value. W. E. Sutton is unwatering the Skyline mine at Ainsworth. In the Dewey mine near Cranbrook an 18-inch vein has been opened that is said to run \$60 in gold and 60 per cent copper. Work has been resumed in the Sunset mine near Rossland, which is down about 315 feet. The last payment has been made by the B. A. C. on the Josie at Rossland. The amount was \$150,000. A new strike was made on the 300-foot level toward the Le Roi ground, said to average \$29 in gold and copper.

The War Eagle at Rossland is shipping 1200 tons per week. The Center Star will begin shipments of equal extent as soon as its new electrical hoist is in place. The Iron Mask is shipping steadily. The Deer Park will send out ore as soon as the new compressor plant is installed. The Le Roi Company, which ships 200 tons per day to its Northport smelter, August 1 increased its tonnage 50 per cent.

At Silverton J. C. Harris sold to the Northwest Mining Co. the Tyro and Boatswain mineral claims for \$7500. From the Hidden Secret mine near Pilot a shipment of fine tons to the smelter gave 165 ounces silver, 4½ per cent copper and \$8 in gold. A strike of a body of carbonates carrying blocks of galena from 25 to 500 pounds in weight is reported from the North Star group in East Kootenay.

There are thirty men employed at the Porto Rico mine at Ymir. The number will be sixty after the completion of the mill about to be built. Work on the 2500-foot aerial tramway has begun. The ore shipments from Rossland for last week were 2140 tons.

Ashcroft Journal: The sum of \$500,000 has been spent in building dredgers for work in the gold-bearing streams of British Columbia the past five years. Now that men are recognizing the fact that suction pumps do not work in the river beds here, and that buckets and elevators do, we may expect good results.

It is reported that the Oleson dredger—the first one—as the company have machinery here for a second one at Quesnelle, will be in operation soon. The Pittsburg dredger is about ready to begin operations. The Deer Park Co. at Rossland has decided to install a compressor plant at once. The shaft is down 245 feet, and three eight-hour shifts are continuing work. Drifting has been done at the 160 level, showing a large ledge of iron sulphides. Five inches of galena running 220 ounces in silver has been struck at a depth of 500 feet on the Sovereign, Slocan, after running a tunnel of 300 feet. Over 4000 feet of air pipe has been laid at the Noble Five mine.

Returns from the shipment of the Mollie Hughes gave 554 ounces silver and \$10 in gold; average returns from the whole ore mined by the company gave \$95 per ton net.

THE KLONDIKE.

From the Klondike via St. Michaels arrived last Sunday over 100 men on the steamer St. Paul, bringing about \$1,500,000, mostly from El Dorado and Bonanza creeks. Some of the men had \$100,000. It is claimed that the Canadian Government had collected 10% royalty on \$20,000,000, and that the Roanoke, due today, would bring \$7,000,000. The men say that the present is a very good season for work. The influx, however, has cut the wages from \$15 per day; it is thought they will be but half that by next season. There are 15,000 men at Dawson, 4000 at the mouth of the Stewart, eighty miles below, and 2000 at Little Salmon. The prices of all the necessities of life are considerably below that of one year ago.

A. Fetz of 1502½ California street, San Francisco, returned from the Klondike last Sunday. He started to Dawson July 27th, '97, and reached there September 28th. He mined on Bear and Hunter creeks. The method of mining was by sinking a 3x7 shaft to bedrock.

In some instances the bedrock pitched from 12 to 13 feet in 15 yards. By building fires both night and day they succeeded in making from 12 to 18 inches depth in twenty-four hours. The slush and gas in the drifts were hard on men's constitution and eyes, and often necessitated sinking additional shafts for air and draft for the fires. In some instances they found gold in the gravel, but mostly on bedrock. Dirt had to be handled twice, raising it and again in springtime to sluice it. When a bucket was raised and emptied it was immediately frozen solid. All claims within about 100 miles of Dawson on the principal and tributary streams are taken. On all gold taken out over \$2500 a tax of 10 per cent had to be paid to the Canadian government. A sworn statement was exacted as to the amount of the output. Thus far El Dorado creek has produced the most gold. The size of a claim is 500 feet on the stream from rim to rim, and if the bench were added \$100 had to be paid to the Government. The upper portion of Bonanza creek yielded well, but the lower part did not pay. Many prospectors will return to America from Northwest Territory. The artificial light in drifts and cabins was in many cases produced from muckluch fish oil. Dogs are fed on rice and fish. Game was very scarce. A man paid \$700 for a bear, another \$1000 for a moose. Potatoes, when Mr. Fetz left that country, were \$1 per pound, eggs \$3.50 per dozen, tobacco \$2.50 per pound. A native Malamoot dog sold for \$150. The ordinary canine sold for \$50. Poles were used for rifles, and in general only coarse gold was sought. In some instances men used quicksilver to save fine gold found in black sand. Ground that wouldn't yield 15 cents a pan was abandoned. Two winners' work will finish El Dorado creek. Claims are held there at \$100,000 to \$200,000. The miner who goes in there now will not be the great money winner. The speculator who has capital will be the successful man, and, prudently invested, he can make as much 'neath home shelter and home comforts. Fetz would not go there again for the purpose of mining. Wages were from \$1 to \$1.50 per hour, averaging from five to seven hours a day, exclusive of board. He estimates that the St. Paul brought down \$1,280,000.

D. T. Edgar of Clovis, Cal., was among the returning Klondikers to San Francisco this week. He left California for Alaska March, 1896, and was at Forty-Mile when the discoveries were made on Bonanza creek. They heard of the discovery two days after they were made and 150 men immediately started for the new find and each located a claim. He has been fairly successful after two and a half years of hardship.

Returning he left Dawson June 26th in company of 176 passengers on the steamer Bella. Their boat passed the steamers May West, 150 passengers, and the Hamilton and Wear, 150 passengers. With few exceptions, every man carried gold and drafts, though the total could not be correctly ascertained. Mr. Edgar and his company worked on Bonanza creek eleven miles from Dawson. When leaving there for his homeward trip flour sold at \$8 for fifty pounds and bacon 60 cents per pound. Water was short this spring and many could not wash their gravel. The cutting and burning of timber has caused the moss to dry and absorb the waters, though rainfall, too, has been less than usual. People who reached Dawson this spring were obliged to go into the interior at least seventy-five miles to find unoccupied ground. They succeeded getting in by horse or boat, but can't get feed in winter for horses. Dogs are preferable, and not less than two should be taken. The main street of Dawson, a half mile long, is as crowded every day as Market street in San Francisco.

Wages were 75 cents to \$1.50 per hour, but they will fall to 60 cents on account of the large influx. This does not include board. There is little work obtainable in summer. At present there are twenty men for every job throughout the Klondike district. Unless new country is found men cannot expect to make anything by going now, and unless possessed of \$1000 and two years' provisions it were ill-advised for anybody to go.

On Hunter creek prospected ground for sale is held at from \$25,000 to \$50,000. On Bonanza creek it is held at from \$100,000 to \$200,000. On El Dorado creek, fifteen miles above Dawson, claims are held, from the forties downward, at from \$50,000 to \$80,000.

The method of working the claims is by sinking from 12 to 24 feet and drifting under the frost, then raising the gravel and saving it for washing in the spring of the year. The ground in the drifts is loosened by fires during the night.

Mail facilities for Northwest Territory are very poor. They had three Canadian mails during the winter. Americans got no mail in or out all the season.

There are 25,000 persons in Dawson and 3000 on Eldorado creek. Yukon river is unusually low. The water in many places is not deeper than 3 feet. Eldorado creek has yielded more than half the winter's gold. Nearly all the rest came from Bonanza creek. Letters from the managers of Canadian banks at Dawson say the Gold Commissioner estimates the production of gold at \$7,000,000.

UTAH.

A shipment of thirty-five tons from the Treasurer mine, in Dry canyon, yielded \$35 per ton. The shipment by the Indian Creek M. Co. yielded \$92, with 103 ounces of silver. The Deer Trail mine, at Marysville, has begun work on a 500 foot tunnel. The Hercules of Stockton made a five-carload shipment of good grade ore. The Centennial Eureka, Eureka, shipped two carloads that yielded forty-seven ounces silver, \$10 gold and 16 per cent copper a ton.

The Dalton M. Co. took possession of the Dalton mine and put a force to work. On account of the expiration of contracts, neither the Bullion-Beck nor the Eureka Hill have made any shipments this month. Work is

progressing as usual. N. C. Gresbeck is developing a saltpetre property near Springville. The mineral is in a soft sandstone formation.

The Carlissa mine, Tintic, made an ore shipment which assays 42 per cent copper. A second vein has been found in the Triumph, Silver City, at a depth of 140 feet. The extent of the vein has not been determined; it is impregnated with sulphides similar to those found overlying the main ore body at the Swansea. Shipments from Tintic were fifty-six cars of ore, two of concentrates, and three bars of bullion.

W. S. Bacon bought one-half of the \$26,000 bond on the Undine mining property at Provo. Work will immediately be pushed forward, and the property developed as rapidly as possible.

Smelter returns from the shipment of concentrates from the Washington, at Frisco, have satisfied the management that the ores may be profitably milled. The Washington will confine its output to the high grade ores. The Galena of Fish Springs shipped sixteen tons of high grade silver and lead ore.

The Godiva mine, in the Tintic district, has started work and is hoisting. The Lower Mammoth made a shipment which returns a high percentage of lead and sulphurets of silver. The Omaha, at West Dip, has settled its legal troubles, and development of the property will begin without delay. The Montreal, at Milford, is shipping copper ores and expects to increase the output the remainder of the season.

Work has resumed on the Manora, at Silver City. The mine at an earlier period was productive of nearly \$100,000. When the sulphides were reached operations were suspended. The intention is to go to considerable depth. The Mercur mill will be enlarged without delay to 350 tons daily capacity. The Butterfield Co. at Bingham have begun work on a 1300-foot tunnel to obtain a more economical outlet for its ores. The Grand Central, at Tintic, output for the first half of July was forty-two cars. The output for the month will exceed that of June 200 tons. In the shipments were several lots that ran well in copper and gold. Ore shipments from Silver City the past week were thirty-three carloads. At Bingham a strike in the 400 of the Winnamuck is reported of good ore.

E. A. Wall has taken a lease on the All's Well group and has resumed sinking. The Swan-Bemis mill last week turned out Spanish ore concentrates at the rate of twenty-five tons daily. The Dalton & Lark, at Bingham, shipped three cars of silver and lead ores and six of concentrates. The Galena of Fish Springs marketed its latest lot of ore on a basis of 47 per cent lead, 110 ounces silver and \$1.40 gold per ton.

Miner: The stamps and vanners at the Sioux mill, Eureka, are being hung up. It is reported that the engine is almost worthless, and that the mill will require a complete overhauling.

IDAHO.

The dredge operating on Snake river near Caldwell made a recent run that indicated that they can handle 2000 yards of gravel per day.

The Montana & Idaho G. M. Co. have begun work on the Hughes & Hunt property near Salmon City. A 4-foot vein of ore was struck which it is said runs \$50 per ton. The Bingham placer keeps steadily at work. The Joshua Hendy hydraulic elevator raises and discharges into the sluices at such a rate that a large sized hole down to bedrock has been excavated to the amount of about 18,000 yards during fourteen days' work. At Florence work is progressing on the Banner shaft. A depth of 200 feet has been attained. There is much activity in placer mining. G. H. Roberts, representing Philadelphia capitalists, has bought the Moore creek bedrock flume property and a payment has been made.

The Eureka Hill mine near Warrens has opened a 5-foot vein of high grade ore. Ten tons of ore from the White Mountain mine netted \$900. In the Candelaria mine at Florence a 19-foot wide vein is producing ore that assays \$40 per ton.

The Morning Star mine near Sandpoint has run a tunnel 110 feet. The ore assays \$34.64 in gold and a small amount of copper.

Baker City Democrat: The Peacock mine in the Seven Devils district has a 65-foot shaft and five or six open cuts exposing the vein, which is about 400 feet long and averages 120 feet in width. A tunnel 20x30 feet is being run to tap the vein at a depth of 50 feet below the 65-foot shaft. The output of the Peacock for June was 6000 tons of ore, which is said to run \$300 to the ton. It is estimated that there are 100,000 tons of ore in sight in the mine. There are several other mines more or less developed. At the smelter, which is ten miles from the Peacock mine, there is used every day of twenty-four hours 32,000 pounds of copper ore, 5200 pounds of charcoal, 11,000 pounds of coke, 12,000 pounds of iron, 4000 pounds of slack and 26,000 pounds of lime. This turns out about three tons of metallic copper ore valued at \$900.

Idaho World: A raise is going through good ore in the New York mine near Idaho City. The company contemplates sinking a shaft 400 feet deep. The lower tunnel taps the ledge 570 feet deep. The Twin Sisters Co. shaft on the Golden Fleece mine near Centerville is down 92 feet. The 5-stamp mill is completed. The stamps weigh 1000 pounds each.

MONTANA.

In the East Pacific mine near Winston sixty men are taking out more than a carload of high-grade ore every day, and within the next sixty days the force will be increased to 125 men. A fifty-ton concentrator is to be erected in the near future. The H. E. Lee party, which has been placer mining near Fort Benton, reports a good season. A clean-up, four men working eight days, gave them \$381.

The Big Bonanza near Walkerville is reported paying. Shipments of silver ore are said to return 100 ounces silver per ton. In

Montana City district the Overland is shipping four cars of ore per week, besides what it sends to the 10-stamp mill, making a weekly output of a little better than 100 tons. Some of the ore smelted nets about \$1400 per carload. The Gold Mint mine and mill at Sylvanite are in operation. The mine is producing about 140 tons of ore per day.

Larabee Bros. & Co. shipped about \$8000 in gold dust Wednesday, mostly from Pioneer. G. Okerman has leased for three years the Baker, Gray Eagle and Equator mining claims near Baker. He has begun work on the Equator, and is working three shifts. On the other claims about 100 men will be set at work as soon as they can be used. The development work on them is in about 200 feet. The claims run well in lead and silver. These properties have lain idle for several years.

The Clancy mine, referring to the revival of the mining industry in that section, enumerates seventeen mines in operation, of which two-thirds were idle less than a year ago. H. F. Burgess & Co. have bonded the First Shot mine, near Basin, and will resume work on a large scale. Pumping machinery and a hoist will be put in and the shaft sunk to the 200 level. They will have less than 4000 gallons of water to handle daily.

Clancy Miner: One by one the mines of Lump gulch are resuming operations, and the stagnation in the mining business consequent upon the strike of two years ago is but little felt here.

Madisonian: The Lester mine near Virginia City has been sold to W. A. Clark who is said to have paid \$100,000 for the property. The ore assays \$200, and the 20 feet that has been exposed will average \$50. It was discovered about a year ago; nine months ago it was bonded to Helena people, who, after working on it a short time, abandoned it, as unworthy of further effort. — The Gold Dredging Co. at Bannack shipped \$10,000 worth of gold last week. — There are in the neighborhood of 400 tons of concentrates at the Snow Shoe mine near Libby ready for transportation.

WYOMING.

H. Andrews, who is developing gold-bearing ground near South Pass received a certificate from the Gold & Silver E. Co., in which he is assured that 94 per cent of the values contained in his ore may be saved by a process combining amalgamation and cyanidation. He will continue work on the property.

Work is progressing on the Nellie Queen mine at Independence Rock. The property produces ore that yields 37 per cent copper and \$3 gold per ton. A carload of ore has been shipped to Deadwood.

SOUTH DAKOTA.

The Gilt Edge mine near Deadwood is shipping fifteen tons of ore a day. — The Little Blue mine at Yellow Creek is shipping two carloads a week which runs \$100 a ton. — The Wasp No. 2 is shipping four carloads a week of ore that will average \$100 a ton. — The Highland Chief Co. of Spruce gulch made a test run of 140 tons of ore which milled on an average \$4 a ton gold.

MICHIGAN.

The last report of the Michigan commissioner of mineral statistics says that during the year ending Nov. 30, '97, in the iron and copper mines of Michigan, sixty-two men lost their lives. The average was 3.70 fatal accidents per 1000 men employed. The Finnish workers suffered most in proportion, twenty-six of that nationality being killed. The falling of ore and rock and the rolling of pieces of rock down the slopes were responsible for the death of twenty-six men. Nine were killed in blasting, by premature or delayed explosions. Six were caught by skips or cages, a portion of these in the attempt to get on moving cages.

News Bureau: The Arcadian copper mine is working 200 men and will double the force before Sept. 1. The mine has four shafts.

The Calumet & Hecla has now 4000 men on its payroll, employed in the mine, mills, and smelters, and it is the largest employer of labor in the Lake Superior district.

The Quincy mine will install a plant of hoisting machinery capable of raising rock from a depth of 8000 feet—about a mile and a half. At present the deepest shaft in the Lake Superior copper district, or in the world, is the Red Jacket shaft of the Calumet & Hecla, which has a vertical depth of 4900 feet.

The Baltic mine will begin producing copper Aug. 1. A three-mile railroad extension will give communication between the mine and the stamp mill of the Atlantic Company, which is to treat Baltic copper. The Baltic has traced its vein nearly a mile, and has five shafts, all of which can be producing within a year.

Between 10,000 and 11,000 workmen are at present employed by the mines of the Lake copper district.

The Buffalo iron mine at Negaunee is being worked by a small force after several years idleness. About 100,000 tons of ore is in sight, and as this is removed the mine is to be surrendered to the owners of the ground by the lessees.

A dozen or more mines of the Marquette and Menominee ranges are producing silicious ore, a strong demand for which has arisen within three years, largely for use with fine-grained Mesaba ores which are deficient in silica and too high in phosphorus for Bessemer pig iron unless mixed with other ore unusually low in phosphorus, as all the high silica ores are.

PENNSYLVANIA.

Out of the coal seam the thickness of choice coal wrought about Pittsburgh is 5 feet, at Charleroi 6 feet, at Brownsville 7 feet and at Fairmount 8 feet. A miner's day's work in the ordinary wide room, cutting and filling, ranges from five to six tons of rough coal at the former place, and ten to twelve tons at the latter. The content of sulphur is prac-

ticable to keep down to 1 percent. The earthy matter, well disseminated in coal, adds mechanical strength to the coke, enabling this to uphold the burden in high smelting furnace, so that the great quantity of air (twelve times the weight of fuel) can be readily driven through. The common method of mining about Pittsburgh is to have rooms of 7 yards wide, separated by pillars 4 yards wide, and driven 75 or 80 yards deep, or more and less, as the dip increases and makes a difference in dividing the 150 or 160 yards space for the rooms driven in opposite directions to meet in between. At Fairmount the general plan is to reach in the steeper coal from one flat entry through to the pillar along the next higher. The size of room and pillar are alike, 6 to 7 yards, or else the pillar is larger. A good practice is to interrupt the long series of long rooms by leaving a solid block for half depth from entry; this block displacing two rooms and three pillars after every ten open rooms. These two usual methods of mining the coal are of equal merit in having the least narrow work of extracost, while aiming to get out all the coal.

COLORADO.

BOULDER COUNTY.

The Franklin mine, near Boulder, has a daily output of twenty tons of smelting and milling ore. — The old Smuggler mill at Ballarat started June 27th to work the dump which has been accumulating for twenty-five years, and contains nearly 30,000 tons of low-grade ore. The mill has a capacity of twenty-five tons per day on this class of ore. The mine is soon to be unwatered, put in repair and worked on the leasing system. It has not been worked for several years.

CHAFFEE COUNTY.

The New Year mill at Granite has started. The stamps weigh 800 pounds each.

CLEAR CREEK COUNTY.

In the Silver Queen mine, on Seaton mountain, a body of silver ore was encountered which ran in 100-pound tests 600 ounces in silver and a fair amount in gold.

EL PASO COUNTY.

The drift on the new ore body in the Half Moon claim of the Mabra, Cripple Creek, has gone through 75 feet of ore and it is 32 feet wide. Twenty-three feet wide of the ore is pure smelting as it comes out. Carload shipments have returned \$55 to \$70 per ton. From two shipments \$5000 was netted. — The Pharmacist only made a production of about 100 tons of \$75 ore during the past month, owing to the large amount of development work in progress. — The Pinto of the Free Coinage group is shipping about thirty tons of \$80 ore a week. — Simmons & Co. of the Zenobia made a shipment of ten tons of \$125 ore, six tons of \$360 ore and two tons valued at \$800 a ton.

The Garfield Con., Cripple Creek, has resumed control of the Garfield Grouse, the lessees having made their final clean-up. The lessees have for two years kept up shipments and made big money. — A strike is reported in the Vindicator mine, Cripple Creek. The new ore body is an 8-inch pay streak running from \$25 to \$1000 per ton. It was found in the 325-foot level. — The Gold Coin is producing 100 tons daily, with the average value showing improvement. In the fourth level the high grade has proven continuous for 100 feet, and its limits have not been determined. The last shipment from this source returned values of thirty-four ounces, or \$800 to the ton.

Errickson & McDonald, in their lease on Columbus, at a depth of 160 feet found a vein which contained 8 inches of good mineral. The ore is two grades. The first is good for \$500 per ton, and the second about \$100. — The output of the Los Angeles last month was in the neighborhood of 500 tons of all grades. — The first half of the year has shown a production in the Cripple Creek district, according to the returns from mills and smelters, of very close to \$7,000,000.

GILPIN COUNTY.

Post: Operations are to resume on the Rollins properties near Perigo. There has been expended a large amount of time and money in these properties, and considerable ore has been exposed in different openings. The former company expended much money in surface improvements and too little in development, and funds were exhausted before getting down to real mining.

GUNNISON COUNTY.

The Big Seven M. Co., near Pitkin, will resume work immediately. Development was stopped in 1897, but the new shaft, down 170 feet, will be continued as rapidly as possible.

HINSDALE COUNTY.

Near Burrows Park a large body of ore has been traced across the Cimarron mountains, showing telluride indications, and three companies have been formed for the purpose of developing properties.

LAKE COUNTY.

The Arkansas Valley smelter at Leadville says that the silver mines in the western part of Colorado are taking out and shipping more ore than they have since the slump in the price of silver. The recent advance in lead and silver has incited this activity. The smelters are running steadily on these ores. — The La Plata mine, Leadville, keeps up its shipment of 200 tons per month. The ore is settled for on a basis of twenty ounces of silver, 16 cents gold and 37 per cent lead.

Owners of the Small Hopes mine at Leadville are St. Louis people, who have divided \$4,000,000 from profits on their Yankee hill operations, and as much more from their interests in mines worked through the Robert Emmet and R. A. M. shafts. They are daily shipping 300 tons of ore from three leases on sulphide bodies, and through the payroll and expense account distributing a large amount of money in the camp. — The Moline M. & D. Co., working through the Wm. Wallace shaft,

Leadville, is shipping daily 40 tons of oxide iron ore. They are also shipping 50 to 100 tons per month of lead carbonates. — An important development enterprise in the mining district of Leadville is the Yak tunnel. It is in 7000 feet and will require two years for the completion of the bore. The tunnel is progressing slowly, with only two shifts at work and using hand drills. The company is stopping out and shipping sulphides. The tunnel will cut a number of producers at depth. — The Catalpa-Crescent is taking out 75 tons of manganese ore per day, which finds its way to Chicago. The Dyatt lease is shipping 100 tons daily of sulphides to home smelters. The water at 1200 feet depth is not very troublesome.

PARK COUNTY.

A carload shipment from the Morning Star mine, on Mount Bros., yielded per ton: Gold, 1.09 ounces; silver, 45 ounces; lead, 9 percent; copper, 3 percent. — P. W. Breene is shipping 200 tons of sulphides daily from the Col. Sellers mine at Kokomo. He has 100 men on the payroll. — Missouri capital is operating the May (Queen group of mines in Freshwater district. The shaft will be sunk 200 feet; several veins have been opened which give fair returns in gold.

PITKIN COUNTY.

The Cowenboven tunnel at Aspen is being driven rapidly, and it is reported that a body of high grade ore has been found.

SAN JUAN COUNTY.

The capacity of the Howardsville mill is to be increased from 20 to 100 tons daily.

SAN MIGUEL COUNTY.

The Silver Pick, Telluride, is producing some rich ore which is shipped in its crude state and reported to run \$750 in gold per ton. The lower grade is treated at the company's 10-stamp concentrating plant, connected with the mine by a tramway over one mile in length, and forty to forty-five tons are disposed of daily. An average of four tons are reduced to one, and from ten to eleven tons, or a carload, of concentrates are turned out every twenty-four hours. The concentrates net from \$1500 to \$2800 per carload—90 per cent gold and the remainder silver and copper.

SUMMIT COUNTY.

The Pence-Miller Gold Placer Co. have one plant at work on the Blue river, near Breckenridge. A second plant is to be installed next month on the same river on the Golden Crown placer. These plants are supplied with water under a head of from 200 to 300 feet by ditches capable of carrying in the neighborhood of 1500 miners' inches of water. — In the Swan River valley the North American G. D. Co. had two of the Risdon placer dredging plants placed in operation early in the season, and hydraulic mining is also carried on near the mouth of the Swan river. — At the Great Wapiti placer and lode mine, embracing 1800 acres of lode and placer ground, three giants are in operation.

NEW MEXICO.

New Mexican: It is reported that the Hearst estate will shortly lease the seventy-seven claims owned by the Carrasco D. Co. and the Santa Rita Copper & Iron Co. in Grant county. — Last week Hillsboro mines produced 145 tons of ore. — The Rebecca group of mines in La Belle is producing \$40 ore. — The Bennet mine in Dona Ana county employs 100 miners. The Tripp mine is furnishing the Andrews cyanide mill in Sierra county with twenty tons of \$10 ore per day. — J. Williams cleaned up \$306 in gold from his Willow Creek placer after seven days' run. — Work has been resumed on the Tyrole and Elizabeth claims at Hematite. The tunnel is in 350 feet and shows 6 feet of ore.

ARIZONA.

A 20-stamp mill is to be built at the Yellow Dog mine near Yuma. — A 120-ton cyanide plant is to be built to work tailings from the Mammoth mill in Pinal county. — A strike of ore is reported in new ground in the Azurite copper mine near Tucson. — The Arizona Copper Co., at Clifton, will add to its present reduction works two 150-ton concentrators and a new furnace. — The Fresnal mines of Wicks and the Allison, in the Baboquivaris, are turning out ore running high in gold and 277 ounces silver to the ton. — The White Hills M. Co. of Mohave county is running but fifteen of its forty stamps, but is boring for water with which to run all the stamps. — The Old Dominion Copper Co., of Globe, will start up its smelter with a new engine and blower this month. — The Sheepstall mine, near the Colorado river in Mohave county, is keeping ten stamps supplied with ore yielding eight ounces of gold and seventy to eighty ounces of silver to the ton.

The erection of the machinery of the Temple Bar Con. M. Co. on the Colorado river, in Mohave county, is progressing. As soon as completed the washing of gravel will begin. — About 500 feet of work has been done on the Gold Bug property near the Black Rock district, Wickenburg. The ledge averages 30 inches in width. — The San Marcus group near Ehrenburg is said to have a vein from 50 to 75 feet wide of good ore. — Fifty stamps are dropping at Mammoth and thirty at Schultz. — Eight carloads of ore have been shipped from Kingman since the 1st of July.

The Rosemont Copper Co. at Rosemont is developing its different properties successfully. There are 1500 tons of ore on the dumps. — Along the Cebar range the mines are turning out considerable ore. The Tennessee mine has in south drift a chute of nearly solid ore 5 feet thick, with no wells. They also have an increase of ore in their upper level to the north. — The Spenezuma M. Co. has thirty men at work near Fort Thomas. The company has eight claims, carrying gold, copper and silver. — Sinking in the Esmeralda mine near Kingman has been discontinued on account of water near the 200 level. Drifting continues. The ore

body is 5 feet in width and runs an ounce in gold to the ton and carries some copper.

The Spenezuma Co. of Arizona is the name of a new mining company operating in the vicinity of Black Rock — Ashton & Reese have sold a quarter interest in some mining property in the Santa Maria district, Yavapai county. — D. B. Gillette and B. B. Thayer, representing the Hearst estate, have secured the Gold Note property near Prescott and will resume operations on the property. They have already spent about \$90,000 in developing the property, and they will make an expenditure of as much more before the property will commence to pay. While there are large bodies of ore opened up it is not very high grade and will require a large mill to make it pay. It is said that this will be erected soon.

The C. O. D. mill, in Mohave county, is turning out five tons of \$60 concentrates daily.

The Ewing 10-stamp mill on the Colorado river in Mohave county has started up on Sheep Trail ore. One hundred tons will be run through as a test. Thirty-five tons of ore will be hauled from the mines to the mill daily.

MEXICO.

The Hacienda San Francisco at Pachuca is running eighty stamps day and night. W. H. Armstrong Jr. is Mgr.

The business of the Mexican Sulphur Co. has been suspended until the war with Spain is over. The offices of the company are at Yuma, Arizona, and Pittsburgh, Pa.; the sulphur mines are 200 miles south of the Mexican boundary line, on the Colorado river. Sulphur is a contraband of war, and President Diaz of Mexico gave the company notice that its shipment must cease.

The Sirena mine, in Guanajuato, is erecting an 80-stamp mill. The owners are American capitalists, who propose to invest \$250,000 in this development of the property, which adjoins the Rozas mine, and contains practically a continuation of the same lode which is known to have yielded \$600,000. — The American Co. working the deposits of tailings in the Guanajuato river are said to be meeting with success.

The Nolan shaft, in El Oro district, is reported to be in good ore. The quartz assays one ounce of gold and thirty of silver to the ton.

LOWER CALIFORNIA.

The Viznaga mine near Alamos shipped \$2000 in bullion last week to San Diego. — El Bolijo mines at Santa Rosalia are said to be producing 1000 tons of copper a month. The copper is shipped to London. It is contemplated to put in machinery to increase the output to 2500 tons a month. A Mathiot is the owner of the property.

AUSTRALIA.

At the Broken Hill Proprietary 21,357 tons of ore were treated for the four weeks ending June 23, including product from ore purchased. The output from the refinery was 1898 ounces gold, 427,865 ounces silver, 2545 tons of lead, 35 tons antimonial lead; the copper matte contained 17 tons of copper and 23,616 ounces silver.

WALES.

Dr. Le Neve Foster, in his annual report on the mineral industry of the North Wales district, remarks that a dredger has been set to work for bringing up sand from the bed of the Mawddach estuary, between Dolgelly and Barmouth, with the object of determining whether gold can be extracted in paying quantities.

Commercial Paragraphs.

The Weber Gas & Gasoline Engine Co., of Kansas City, Mo., write: "Have just completed the installation of three plants for the Avino Syndicate of London, at San Gabriel Station, Durango, Mexico, consisting of hoisting plant, direct-connected pumping plant and crusher plant, all to be operated on gasoline; pumping plant will be operated 800 feet underground."

Under date of April 27, '98, Supt. Geo. S. Baum of the Grizzly Flat G. M. Co., Grizzly Flat, Cal., writes to the Risdon Iron Works, Howard and Beale Sts, San Francisco: "The last dies you sent have been in use since March 1st; our mill has been running twelve hours out of the twenty-four nearly every day since. The dies are wearing smooth and true with hardly any perceptible decrease in their size. The shoes you sent last July are still in the bosses, having been in use since August 23rd last; they range from 2 to 3 inches in depth at present, and will probably last three months longer."

The development of electrolytic processes for the production of refined copper has proceeded very rapidly during the past three years, and at the present time, a very large proportion of all the refined copper is thus produced. The Westinghouse Electric & Manufacturing Company have installed a very large amount of apparatus for this class of service. One of the principal installations is at the refinery of the Anaconda Copper Company, Anaconda, Montana, where ten generators of 270 to 300 kilowatts capacity have been installed. Another very large installation is that of the Boston & Montana Consolidated Copper & Silver Mining Company, Great Falls, Montana, where two 810 K. W. Westinghouse engine type generators are in service. The latest comer in this field is the Raritan Copper Works of Perth Amboy, New Jersey, who are about to erect the largest copper refinery in the East. They have contracted with the Westinghouse Electric & Manufacturing Company for three 600 K. W., 150 volt, engine type generators, 150 r. p. m., with a 9-section switchboard for electrolytic service and the operation of two 75 K. W., 220 volt, engine type generators, which will be used for lighting and power service. The installation will be the most complete of its kind in the world.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING JULY 12, 1898.

- 607,209.—FRUIT DRIER—T. Beck, Watsonville, Cal.
 607,331.—KILN—J. Berry, Tacoma, Wash.
 607,335.—GATE—H. C. Belts, Middletown, Cal.
 607,336.—LIVING DEVICE—H. M. Burnett, S. F.
 607,213.—PENHOLDER—J. H. Campbell, San Jose, Cal.
 607,321.—JOINING RAILWAY BARS—W. G. Curtis, S. F.
 607,347.—MOWING MACHINE—V. Daniele, S. F.
 607,223.—EARTH AUGER—E. H. Dyer, Alvarado, Cal.
 607,359.—MUSICAL INSTRUMENT—A. J. Forrest, Seattle, Wash.
 607,334.—SHAPING CUTTER—J. Hatch, S. F.
 607,237.—SUCTION DREDGE—F. H. Heath, Tacoma, Wash.
 607,246.—WATER WHEEL BUCKET—G. H. Johnson, Sisson, Cal.
 607,379.—BELT REPAIR KIT—W. M. Jones, Santa Monica, Cal.
 607,332.—SCREEN FOR DOORS—J. H. Koons, Seattle, Wash.
 607,118.—CAR FENDER—W. H. Martin, Los Angeles, Cal.
 607,120.—WAGON—H. D. Morton, S. F.
 607,072.—WAVE POWER—J. M. Palmer, Fort Grant, Cal.
 607,123.—BUTTER MOLD—Maria Pfening, Santa Barbara, Cal.
 606,133.—CENTRIFUGAL PUMP—J. Richards, S. F.
 607,135.—STATION INDICATOR—G. Rischmuller, S. F.
 607,153.—THRESHER FEEDER—A. W. Severance, Walla Walla, Wash.
 607,198.—GROCERS' CADDY—C. M. Symonds, S. F.
 607,098.—STATION INDICATOR—H. C. Turner, S. F.
 607,200.—STATION INDICATOR—W. A. Turner, S. F.
 607,315.—INSULATOR—C. L. Wingard, Walla Walla, Wash.
 607,153.—WOODEN PIPE—W. J. Woodward, National City, Cal.
 607,317.—ENGINE—G. L. Woodworth, Palo Alto, Cal.
 607,320.—WRENCH—J. N. Young, Alameda, Cal.
 29,045.—DESIGN—M. L. Altop, Sacramento, Cal.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

GROCERS' CADDIES.—C. M. Symonds, San Francisco, Cal. No. 607,198. Dated July 12, 1898. This invention relates to an improved containing caddy especially designed for the reception of tea, coffee and such other articles as it is required to hold in bulk, but which are sold in small quantities. It is especially designed to provide a caddy which may be filled at the factory or other depot, and which may be then closed for shipment, and after being removed from its outer case, the lower part can be immediately opened to prepare it for use. The caddy has a rectangular opening in one side, near the bottom, and a segment is hinged in the lower part of the opening having an opening in the curved face, a second segment within the first one is independently hinged and has short legs projecting from the upper angles of its rear edges adapted to rest upon the bottom of the case when the segment is closed so as to leave a small open space at the bottom. Within the case are oppositely inclined directing plates which direct the contents toward the discharge opening, one of said plates extending from the hinge connection and forming a close smooth joint therewith to permit the introduction of a scoop for the removal of portions of the contents of the case.

MOMENTUM WATER-WHEEL BUCKET.—Geo. H. Johnson, Sisson, Cal. No. 607,246. Dated July 12, 1898. This invention relates to improvements in buckets for water-wheels of that class in which the water is delivered into the wheel-bucket under a high head or pressure, such wheels being technically known as "hurdy-gurdy" wheels. The buckets are formed in pairs, with one bucket in advance of the other, and uniting in a common radial plane along the adjacent edges for a portion of the length of the bucket, then curving outwardly and independently away from each other for the remainder of the distance, thus insuring a perfect clearance of the reactionary water from the sides of the wheel. The nozzle is so placed in line with the partition between the buckets that it delivers water alternately into the buckets on each side of the partition.

FRUIT DRIER.—Thomas Beck, Watsonville, Cal. No. 607,209. Dated July 12, 1898. The object of this invention is to provide an apparatus for the more perfect desiccation of fruit, vegetables and other substances which it is desired to deprive of moisture. It consists essentially of a polygonal chamber having peripheral doors opening through each of the faces of the polygon; fruit trays and supports which carry the trays so as to leave a space between the front edges of the trays and the inner faces of the doors, with jams by which this peripheral space is divided into a number of vertical flues corresponding with the number of doors and series of superposed fruit trays. A centrally disposed rotary fan acts to force air outwardly over the trays, thence it is discharged upwardly through the vertical flues. A heating furnace is disposed in the lower part of the apparatus, the air thus heated rising into the central chamber and being distributed and discharged outwardly by the fan.

Recently Declared Mining Dividends.

- Mercur, Utah, \$25,000; July 20.
 Quincy M. Co., Michigan, \$3.50 per share, \$350,000; payable Aug. 10.
 Sacramento, Utah, \$5000; payable July 27.
 Elkton Con., Colorado, 2 cents per share, \$25,000; July 20.
 Alaska-Mexican M. Co., 10 cents per share, \$18,000; payable July 28.
 Alaska-Treadwell M. Co., 37½ cents per share, \$75,000; payable July 28.
 New York & Honduras Rosario M. Co., 10 cents per share, \$15,000; July 15.
 Homestake M. Co., South Dakota, 25 cents per share, \$31,250.
 Crowned King, Arizona, 2 cents per share, \$6000; July 20.

Recent California Mining Incorporations.

- Turner Flat D. G. M. Co., Sonora; capital stock \$100,000, subscribed \$25; E. L. Rehn, J. J. Collins, J. Blois, N. F. Pickle, E. J. Landers.
 Anaconda G. M. Co., San Jose; capital stock \$350,000, subscribed \$201,500; F. L. Argalt, H. Morton, P. Berg, T. W. Hobson, J. R. Curran, E. V. Hunt, A. J. Smith, J. Paul, H. Argalt.
 Brescia M. Co., San Francisco; capital stock \$191,250, subscribed \$4250; J. Rocca, L. Slesinger, U. Remensperger, I. M. Kallach, J. B. Brescia.
 Ivanpah Smelting Co., Los Angeles; capital stock \$150,000, subscribed \$500; R. F. Kellman, G. D. Copeland, B. W. Wattington, J. D. Hanbury, T. M. Loop.

Catalogues, Etc.

Catalogue No. 5, Metallurgical and Mining Machinery, issued by the Union Iron Works, San Francisco, contains 164 quarto pages of more than ordinary practical value. Progress and improvement in mining and milling for fifty years are illustrated herein and the latest in several departments are minutely described with sectional drawings and details as to construction, giving prices, weights, sizes, with practical pointers regarding what may be needed in general requirement. Much that is new and which has not heretofore appeared is published. Sixteen pages are devoted to tables of measurements, capacities, values, etc. The cost of such a work is considerable, running into the thousands. One engraving therein cost \$400. The book will be sent to any address upon request addressed to Union Iron Works, 222 Market St., San Francisco, Cal.

Air Compressors, Catalogue No. 32, from the Ingersoll-Sergeant Drill Co., 26 Cortlandt St., New York City, describing and illustrating the air-compressing product of that factory, complete as to details and of value as a compendium of information on the subject. There are 96 pages of well prepared data of different classes and styles of air-compressors built by the Ingersoll-Sergeant Co., who will send the book to any address upon application to their New York office, or to their local agents, the Parke & Lacy Co., 21 and 23 Fremont St., San Francisco.

Obituary.

At Dutch Flat, Cal., on the 17th inst., W. A. Doolittle, Supt. Alta gold mine, died.

Mining Investor.

Will the party who addressed Box 87, Oakland, kindly repeat, letter and address having been lost.

STAR PATTERN for Heavy Pressure.
 U. S. PATTERN for Ordinary Pressure.
 We warrant them for all service where a quick, reliable action is required.
 It will pay you to investigate.
 Full particulars from any jobbing supply house, or direct from the manufacturers.

THE WM. POWELL CO., CINCINNATI, O.

INVENTORS, Take Notice!
 L. PETERSON, MODEL MAKER,
 226 MARKET ST., N. E. Corner Front (Up Stairs), SAN FRANCISCO. Experimental machinery and all kinds of models. Tin and brasswork. All communications strictly confidential.

AN ASSAYER AND CHEMIST of long experience, who is also an Amalgamator and Practical Millman, desires a position with a mining company. Address W., care of Mining and Scientific Press.

WANTED—Position as Manager of Gold Mine or Mill. Have had ten years' experience in mining and milling free and base gold ores and thoroughly understand all departments. References. Address Z, Mining and Scientific Press.

Position Wanted as

AMALGAMATOR

By a man who has had eighteen years' practical experience. Is willing to go anywhere and is not afraid of work. Can give the best of references. Address "K. L.," care of this office, by mail or telegraph.

FOR SALE.

5-Stamp Quartz Mill.
 Shafting, Pulleys and Belting,
 25 H. P. Engine and Boiler,
 Hoist, Pump, Steam Pipe and Fittings,
 Blacksmith, Carpenter and Mining Tools.
 Located near San Andreas, Cal. Enquire of DR. W. G. WALLACE, 636 Sutter St., San Francisco.

The DAISY FLY KILLER, 20c.

The best fly killer known. It is a beauty, neat, clean and attractive—in decorated metal. Will not injure or soil anything. Will attract and effectually kill all the flies in a room. Harmless to persons. Write for one; sent postpaid for 20c. by the manufacturers, SOMERS BROS., 3d Ave. and 3d St., Brooklyn, N. Y.

IT WILL LAST ALL THE SEASON.

ORES! ORES!

Gold, Silver and Lead Ores and Concentrates

PURCHASED AT REDUCED RATES FOR TREATMENT.

SELBY SMELTING & LEAD CO.

416 Montgomery St., San Francisco.

Consign shipments to Vallejo Junction, Cal.

MICHIGAN COLLEGE OF MINES.

Supported by the State of Michigan. Practical work. Electric system. Special advantages for men of age and experience. For catalogue address DR. M. E. WADSWORTH, President, Houghton, Michigan.

FOR PROSPECTORS.

A book written by a prospector, giving information on methods and appliances used by frontier miners. By mail, Twenty-five Cents, postpaid. Address "Prospector," Mining and Scientific Press office, 330 Market St., San Francisco.

330 MARKET ST. S.F.

FRESNO, June 25, 1898.

Hercules Gas Engine Works,
 San Francisco, Cal.

DEAR SIR:—

The fifteen-horse power gasoline engine and hoist purchased from you is doing fine work and is perfectly satisfactory in every respect.

Yours truly,

TUOLUMNE MOTHER LOPE
 M. & D. CO.,

Per N. W. Moodey, Pres.

We have two large books full of testimonials; they speak better for the HERCULES than we can. Our works are the largest in the country. We have built and sold over 3500 engines; they are the standard everywhere. Any size up to 200 H. P. Stationary Hoisting and Marine.

Hercules Gas Engine Works,

405-407 SANSOME STREET,

SAN FRANCISCO, CAL.

HAVE REMOVED
 THEIR

C. H. EVANS & CO.
Machine Works

TO 183-185-187 FREMONT STREET,

Where, with Enlarged and Increased Facilities, they are better than ever prepared to do

First-Class Machine Work

Promptly, and at Reasonable Prices, and will continue the manufacture of

Thomson & Evans Steam Pumps,

Deep Well Pumps, Power Pumps, Etc.,
 Also Marine Engines, Ship and Steamboat Work,
 Pipe Cutting, General Jobbing and Repairing.

Any Book on Any Subject

Connected with Mining, Metallurgical, Mechanical or Industrial Interests,

Will Be Sent Anywhere, Postpaid,

At Publisher's Prices.

A REVOLUTION IN FREIGHTING.

THESE WAGONS ARE ESPECIALLY ADAPTED FOR STEAM FREIGHTING; CAPACITY OF TRAIN 50 TONS.

"The Daniel Best" 50-Horse Power Traction Engine.

The most powerful and only Successful and Practicable Road Engine in the World. Over sixty of them in use in this State, and they are being Successfully and Profitably Employed in Hauling Logs Lumber, Ore, Salt, Borax and other kinds of freight.
The work is being done **FIFTY PER CENT** Cheaper than it is possible to do with Animal Power. They can be operated over any ordinary road where it is practicable to use mules or horses, doing the same work. They can ascend or descend grades as much as 20 to 30 inches to the rod, hauling their loads of 35 to 40 tons, depending upon the condition of the roads; loads may be increased to even greater amount on moderately level roads.
Send for descriptive Circulars and price List of Wagons and Engine. We solicit correspondence. No trouble to answer questions.
Estimates made for complete Steam Freighting Outfits. Address

PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through Dewey, Strong & Co.'s Patent Agency will have the benefit of a description in the Mining and Scientific Press. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

VULCAN ROPEWAY

— WITH —
**AUTOMATIC ORE LOADER AND
AUTOMATIC DUMPING DEVICE.**

For Conveying
Ore, Cordwood,
Etc.

EMPIRE, NEVADA, April 17, 1896.

Vulcan Iron Works.—GENTLEMEN: The Ropeway furnished by your company to convey tailings from Morgan Mill to Mexican Mill, a distance of seven-eighths of a mile, is giving entire satisfaction. We transport 200 tons of tailings in ten hours; one man does the whole business, including elevating tailings from hopper in the ground, operating Vulcan self-loader, and attending to the Ropeway generally. The self-dumper requires no attention whatever. The Vulcan loader I consider the best feature in the whole Ropeway, making it possible for one man to load 200 tons in ten hours.

Yours very truly, J. P. WOODBURY, Supt.

Market Reports.

The Markets.

SAN FRANCISCO, July 21, 1898.

SILVER.—London, 27½¢; New York, 59½¢; San Francisco, 59½¢, nominal; Mexican dollars, 45½¢. New York exchange, eight, 15. According to a ruling of Internal Revenue Collector Scott, orders drawn in the United States payable in foreign countries, though in the form of checks, are subject to a tax of 4 cents on each \$100 or each fraction thereof, under the fifth paragraph of schedule A. The paragraph referred to is that setting forth the tax on bills of exchange.

COPPER.—Lake, quiet, 11.50.

LEAD.—New York quotes 3.95 asked; smelters quote 3.80; local, pipe, 6@6½¢; sheet, 6½¢@7¢; pig, 5½¢.

IRON.—American, soft, \$20 and \$22 per ton. **SPELTER.**—5 and 5½¢.

TIN.—Menlo Roofing, redipped, \$7; English, to arrive, \$4.50; Pig, 18¢.

ANTIMONY.—9½¢, 10.

BABBITT METAL.—16¢.

NAILS.—List per keg: No. 20 to 60d, wire, \$2.25; cut, \$2.00; 10 to 20d, wire, \$2.30; cut, \$2.05; 8d, wire, \$2.35; cut, \$2.10; 6 and 7d, wire, \$2.45; cut, \$2.20; 4 and 5d, wire, \$2.55; cut, \$2.30; 3d, wire, \$2.70; cut, \$2.45; 2d, wire, \$2.95; cut, \$2.70. In carload lots, 10¢ per keg less.

QUICKSILVER.—Domestic, \$42.50@43; export, special rates.

POWDER.—F. O. B. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½¢; less than one ton, 17½¢. No. 1* 60%, carload lots, 13½¢; less than one ton, 15½¢. No. 1** 50%, carload lots, 11½¢; less than one ton, 13½¢. No. 2, 40%, carload lots, 10¢; less than one ton, 12¢. No. 2* 35%, carload lots, 9½¢; less than one ton, 11½¢. No. 2** 30%, carload lots, 9¢; less than one ton, 11¢. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2 per keg.

FUSE.—Triple tape, \$5.10 per 1000 feet; double tape, \$4.35; single tape, \$3.45; Hemp, \$3; Cement No. 2, \$4.35; Cement No. 1, \$3.45.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9.

COAL.—San Francisco coast, yard prices: Wellington, \$8 00; Coos Bay, \$5 00; Seattle, 6 00; Southfield, 7 50.

Cargo lots, Eastern and foreign: Wallsend, \$7 50; Cumberland, \$10 25; Brymbo, 7 50; Cannel, 10 00; Pennsylvania, hd., 14 00; Welsh Anthracite, 12 50; Scotch, 8 00; Rook Springs, 7 60.

COKE.—Foreign, \$13; domestic, \$11 per ton.

CHEMICALS.—Cyanide of potassium is quoted jobbing, 31@32¢ per lb.; carloads, 28¢; sulphuric acid, 2½¢ per lb. for 60%; nitric acid, 12½¢; soda ash, \$1.60 per 100 lbs. 58%; hyposulphite of soda, 2½¢ per lb.; blue vitriol, 4½¢ per lb.; borax, refined, 5@8¢ per lb.; chlorate of potash, 9½¢@10¢; roll sulphur, 2½¢.

LUMBER.—Retail: Pine, ordinary sizes, \$17@18.50; redwood, No. 1, \$18@20; No. 2, \$16@18.

Mining Share Market.

SAN FRANCISCO, July 21, 1898.

During the week the Commissioner of Internal Revenue reversed his former rigid ruling, and decided in effect that if the par value of a stock is \$1 per share, the tax is 2 cents on a certificate of 100 shares or fraction thereof, and, in the same ratio, on stock up to a par value of \$100 per share, on which the tax is \$2 on 100 shares or fraction thereof. This allows the mining stock brokers to see a little daylight. The Comstock companies are preparing to diminish their capital stock, and also make the "par value" of each share \$2.50 or \$3, instead of \$100, as heretofore. Meanwhile, pending the contemplated resumption there of deep mining, work on the main Comstock lode is practically suspended, with the exception of the Sierra Nevada Co. The movement in favor of unwatering the levels and going deeper has got so far as to having the companies favor a concert of action which will result in a joint report from Comstock mine superintendents on the feasibility of the proposition.

Regarding the reorganization referred to above, Collector Lynch of this city has ruled: "That when a corporation with a capital stock has passed a resolution to change the par value of the shares of its capital stock, an agreement to sell the said stock to be delivered at a date subsequent to the date of reorganization will be subject to a tax of two cents (2c) on \$100 of the par value of the stock issued under the reorganization. In other words, any contract for future delivery of such stock will have to pay a tax at the rate of 2 cents on \$100, par value of the stock, at the date of delivery." This enables brokers to continue dealing on basis of the proposed reduction in advance of the organization.

Assessment Notices.

MARGUERITE GOLD MINING AND MILLING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Auburn, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 20th day of June, 1898, an assessment (No. 10) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 257 12th street, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the 4th day of August, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 5th day of September, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
F. METTMANN, Secretary.
Office—257 12th street, San Francisco, California.
The Secretary will also receive payments from 12 to 3 P. M. at his business office, 225 Sansome street.

RED CAP MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Red Cap Creek, Humboldt County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 29th day of June, 1898, an assessment (No. 4) of Two Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, room 14, Nevada block, 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 5th day of August, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 29th day of August, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
WILLIAM McPHERSON, Secretary.
Office—Room 14, Nevada block, No. 309 Montgomery street, San Francisco, California.

GOULD & CURRY SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 7th day of July, 1898, an assessment (No. 84) of 10 cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, room 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 5th day of August, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 29th day of August, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
ALFRED K. DUBROW, Secretary.
Office—Room 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

LEON GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, near Winchester, Riverside County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 16th day of May, 1898, an assessment (No. 1) of 1 1/2 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 7, fifth floor, Mills building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of June, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 25th day of July, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
R. L. CHENEY, Secretary.
Office—Room 7, fifth floor, Mills building, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors of the Leon Gold Mining Co., the day of delinquency of the above assessment is postponed to July 9th, 1898, and the day of sale to MONDAY, August 8th, 1898.

R. L. CHENEY, Secretary.
Office—Room 7, fifth floor, Mills building, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors of the Leon Gold Mining Co., the day of delinquency of the above assessment has been postponed to August 6th, 1898, and the day of sale to MONDAY, September 6th, 1898.

R. L. CHENEY, Secretary.
Office—Room 568, Safe Deposit building, Cor. California and Montgomery streets, San Francisco, Cal.

THORPE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Fourth Crossing, Calaveras County, California.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 10th day of June, 1898, an assessment (No. 10) of 2 1/2 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 44, Phelan building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 18th day of July, 1898, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 8th day of August, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
A. F. FREY, Secretary.
Office—Room 44, Phelan building, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors of the Thorpe Mining Co., the day of delinquency of the above assessment has been postponed to August 16th, 1898, and the day of sale to WEDNESDAY, September 7th, 1898.

A. F. FREY, Secretary.
Office—Room 44, Phelan building, San Francisco, California.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 9th day of July, 1898, an assessment (No. 14) of 2 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of August, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 7th day of September, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

And in accordance with law, and an order from the Board of Directors, made on the 16th day of May, 1898, so many shares of each parcel of such stock as may be necessary will be sold at public auction, at the office of the company, room 57, No. 916 Market street, San Francisco, California, on SATURDAY, the 23d day of July, 1898, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

GEO. W. FLEISSNER, Secretary.
Office—No. 916 Market street, room 57, San Francisco, California.

NOTICE OF DIVIDEND.

Jamison Mining Company, rooms 50 and 54, No. 120 Sutter street, San Francisco, California. June 20th, 1898. Semi-Annual Dividend No. 2.

At their meeting of June 20th, 1898, it was resolved by the Board of Directors of the Jamison Mining Company to pay to the stockholders of the company from the surplus funds in the treasury a dividend of Nineteen Thousand Five Hundred Dollars (\$19,500.00), being five (5) cents per share on the capital stock of the company.

The dividend will be payable at the office of the company on the 15th day of August, 1898, to all stockholders of record on the 5th of August, 1898. Transfer books will be closed at the close of business on the 5th of August and reopened on the morning of the 16th of August, 1898.

SAM. W. CHEYNEY, Secretary.

ANNUAL MEETING.

The Regular Annual Meeting of the Stockholders of the Tuscara Water Company will be held at their office, No. 310 Pine street, rooms 15 and 17, San Francisco, California, on WEDNESDAY, the 27th day of July, 1898, at the hour of 1:30 o'clock P. M., for the purpose of electing a Board of Directors to serve for the ensuing year and the transaction of such other business as may come before the meeting.

J. W. PEW, Secretary.
Office—No. 310 Pine street, rooms 15 and 17, San Francisco, California.

Lunkenheimer's.
Single Bell Chime Whistles

Are unique and handsome in appearance, and produce harmoniously three distinct tones which blend and form a beautiful musical chord. The sound given forth from our style of Chime Whistles, while being more acute and piercing than the common whistle, have not the harsh and disagreeable qualities of the latter and can be heard at a greater distance. The entire bell and dome are cast in one piece, which makes them stronger, more rigid and neater in design than any other whistle on the market.

Specify "Lunkenheimer" make and buy through your dealer.

Made in sizes ranging from 2" to 10" diameter of bell in various styles.

Our catalogue will interest you; free for the asking.

PRESCOTT, ARIZ., February 26, 1898.

Canton Steel Co., Canton, Ohio.

GENTLEMEN:—I have sold Canton Drill Steel for the past ten years—in fact, I introduced it into this district. At that time Jessop's steel was largely used and there was a strong prejudice against the introduction of any new make of steel. The best evidence of the merits of Canton Steel is that it has entirely driven out Jessop's steel.

as well as almost every other make of steel. A guarantee has always been given, that if not giving satisfaction or proving defective, money will be refunded. In all these years I have not had a single bar returned.

Its adoption and use by almost all mines of this district, is certainly evidence as to the unequalled merits of Canton Steel.

Yours very truly,
SAMUEL HILL,

ROPP STRAIGHT LINE FURNACE

FOR ROASTING, CHLORINATING AND DESULPHURIZING ORES.

Extracts from Letters Received from Mr. Philip Argall, Manager the Metallic Extraction Co., Cyanide, Colorado:

January 2, 1897. "The roasting is invariably good. We can do 80 tons per day to 0.13% sulphur, when everything runs smooth. Our month record which, of course, includes all delays, is 1700 tons, from 1.94% sulphur to 0.18%."

February 19, 1897. "Our furnace is now running very nicely indeed, averaging 90 tons per day to 0.10% sulphur, and doing excellent work; in fact, it has improved right along and we are highly pleased with it. For 24 hours ending 7 A. M. to-day 102 tons were roasted."

The ROPP FURNACE is now in successful operation at the following reduction works: The Hanauer Smelting Works, Salt Lake City, Utah (one furnace); The Metallic Extraction Co., Cyanide, Colo. (one furnace); The Colorado-Philadelphia Reduction Co., Colorado City, Colo. (three furnaces); The Selby Smelting & Lead Co., Selby, Cal. (two furnaces); The Mount Morgan Gold Mining Co., Rockhampton, Queensland (one furnace); Broken Hill Proprietary Co., Broken Hill, New South Wales (one furnace); Puget Sound Reduction Co., Everett, Washington; Colorado Ore Sampling & Reduction Co., Creek, Colo.; Consolidated Kansas City Smelting & Refining Co., for the Arkansas Valley Smelting Works, Leadville, Colo.; Robert Lanyon's Son's Smelter Co., Iola, Kansas (two furnaces); Mountain Copper Co., Ltd., Keswick, Cal.

The "James" Ore Feeder.

The "James" ore feeder, herewith illustrated, is a machine for automatic feeding of ores to stamp batteries and other crushing machinery, adjustable in operation, and designed to feed ores wet or dry, coarse or fine. On a cast-iron feed table below the hopper is a bevel gear cast on its under side: motion is given the feed table by an extension of the tappet arm connected with a friction device which engages the sides of a friction wheel fastened on a shaft; on the opposite end of this shaft is a bevel pinion which meshes into the bevel gear on the bottom of the feed table. Part of the ore is scraped off by an adjustable wing projecting from the base of the hopper and dropped directly into the chute by the rotation of the feed table. This table is in the form of a disk, supported under the hopper, inclined bodily and provided with an upward projecting cone in the path of the feed. The discharge edge is placed on a horizontal line, the cone in the center forming a support and preventing the ore from crowding against the front of the hopper or spilling over the discharge edge unless the table is rotated. The shape of the feed table makes it impossible for the feeder to spill.

The advantages claimed by the makers are, that the feed is positive and will not gig back no matter

the friction device and arm as described. Upon the other end of this shaft a pulley is placed, which is driven by a belt run-

ning from a pulley on the mill shaft. The feeder when arranged as above is adapted for feeding roasting furnaces or driers, and when manufactured for this class of work the agents, The Parke & Lacy Co., 21 and 23 Fremont street, San Francisco, furnish a frame of iron instead of wood. The shipping weight with wood frame is 750 pounds; with iron frame, 1000 pounds.

THE Salt Lake Tribune cites the fact that when Manager Allen of the Centennial Eureka was, during the debates in the Mining Congress, arraigning the law defining extralateral rights because of its lawlessness, and calling attention to the ugly practices that had been countenanced by it, he used for illustration the fact that his company had paid out no less than \$200,000 that they might defend themselves against any possible attack from that source. This enormous sum had been paid out for ground from which the company had never marketed a ton of ore. It had never returned the purchasers a cent, nor did they ever expect it to. That \$200,000 was simply spent on the acquisition of ground on which

how slight the motion to the arm; it cannot possibly spill ore of any character and will definitely measure out from one to fifty tons per day of any class of ore.

When used in connection with the Huntington mill, Dodge pulverizer and similar quartz-crushing appliances, in which the tapping motion of the stamp mill is not obtainable, the ore feeder must be driven from a revolving shaft on the mill. In such cases the feeder is provided with a shaft upon one end of which is placed a cam through which motion is imparted to the feed table by

THE "JAMES" ORE FEEDER.

some adventurer might set up an "apex" and under his assumption make a whole lot of trouble. Asked later about the statement, Manager Allen explained that, while the company had not been threatened, it had simply decided to shell out the fortune and take the ground "for protection." The Centennial Eureka is not alone in those experiences. Under existing laws a showing of value in mining property is often the immediate signal for such a move, with indirect overtures for a "compromise" if the inducements are sufficient.

DURING July steamers have been arriving from the Yukon, via St. Michael, with passengers, many of whom were extremely fortunate, others with the usual individual tales of disaster. So far, this year, it is estimated that about \$10,000,000 has been received from that region.

The promoters of the Colorado Pike's Peak Tunnel and Railway Co. exhibit good example of perseverance, whatever may be said of the worth of the enterprise. Originally it was the idea to spend \$10,000,000, more or less, in pushing a tunnel under Pike's peak and the Cripple Creek district, emerging in the vicinity of Victor. Capital was coy, and the promoters of the scheme now assert their intention to raise \$1,800,000, half of which will be spent in constructing a tunnel 18 x 18 feet, the other half in building reduction works at Canyon City. The project is an ambitious one, but the plan in its fruition would seem more interesting than prosperous.

The article on pages 107 and 108 is of timely interest concerning one form of California gold mining destined to renewed prominence. In conjunction with other good work being done, the Government could well afford to survey this lava-capped channel, and locate it, that such mines might be worked with the minimum of prospective expense. Men whose standing and experience entitle their opinions to respect say that there is still \$1,000,000,000 in gold locked therein. The proposed survey would cost probably \$200,000, and would be a good Government investment. This is believed to be a matter worthy the attention of the California State Miners' Association.

REGARDING the important matter of advocacy of the creation of a national Department of Mines and Mining in the recent session of the International Mining Congress at Salt Lake City, Utah, a leading official of the organization in a letter to the writer says: "The question of a Department of Mines and Mining did not come up for discussion until the last day, when the attendance was light owing to excursions to nearby mining camps, and the committee appointed at the convention last year to report on this subject did not present any report at all; in fact, none of its members were present. The resolutions adopted governing this most important matter, and the authority given the President of the Congress to appoint a committee to urge the matter, together with the decision of the organization to maintain permanent headquarters, with a view in part to agitating this very question among the mining people of the country, all goes to show the earnest and determined purpose of the people represented here to have such a department. We realize, however, as we did not realize last year, that we have many difficulties and strong opposition to overcome, and we also realize that persistent, aggressive work in that direction throughout the entire year is absolutely essential to the attainment of our de-

sires." It is to be hoped that such realization will not deter all concerned from active effort to overcome inertia.

EXPERIENCE is a good educator in mining as well as other branches of business. The diatribes of former years against the assessment principle have almost ceased, and in some States, notably Washington, the treasury stock plan is giving way to the assessment idea. While much that has been urged against the plan of assessing mining stock is so, and while nothing can be said too condemnatory of its abuse, yet the fact remains that no other device has ever been found to satisfactorily secure the working of a mine where unanimity did not prevail among the stockholders. Spokane, Wash., mining companies are among the latest to see plainly that assessable stock is the kind that best insures the development of a mining property, and while new companies in that section are adopting that plan in incorporating, old companies are reorganizing and amending their by-laws "so as to authorize the levy of assessments on the capital stock of the company from time to time, as the business of the company may require."

THE testimony of Hooley, the London "promoter," given in the London bankruptcy court last Wednesday, gives interesting confirmation of what has been generally understood—that part of the London press was as venal and corrupt as that of Paris, and that editorial influence is the subject of purchase in Great Britain. On Wednesday last Hooley swore that, in connection with one flotation, it cost him \$315,000 to "square" the London newspapers. For an "editorial" in the *Financial Post* Hooley says he paid \$10,000. Other things also came high. An introduction to Lord Ashburton cost him \$10,000; he paid the Earl of Winchelsea \$50,000 for the use of his name as chairman of one of the schemes that he was "promoting." The *Pall Mall Gazette*, which has long sniffed in scorn at "the venal American press," is also said by Hooley to have had considerable of his money. These disclosures are interesting inasmuch as they throw sidelights on the methods of promoters who buy influence as they would beef, and then throw the blame of failure on American mines and mining methods, making those last the scapegoat for their own nefarious practices.

THE Amador, Cal., *Republican* last week received a letter from a "mining professor" in Pennsylvania, asking the editor if there was "any danger of gold mining giving out" in California. It is not uncommon for editors of newspapers in every mining center in the west half of America to get similar inquiries. Mining "professors" in Pennsylvania and elsewhere are sometimes seized with sudden fear that the gold mines of Colorado, California, Utah and elsewhere may, at the present rate of production, be "exhausted." Such inquiry would elicit no answer but a smile from the recipient. Probably were a similar inquiry sent to a Lake Superior newspaper office regarding copper, or a Pennsylvania one regarding the probable exhaustion of coal, the result would be the same. Gold and silver mines are equally permanent with coal and copper mines. In the commonwealth of Colorado there are over 76,000 gold and silver veins discovered and opened. In that part of the United States with an ocean coast line equal in extent to that from Maine to Georgia, known as California, are something under a hundred thousand similar precious metal veins opened. So with several other great commonwealths west of the hundredth meridian. With improved machinery, reduced cost, railroad development, increased population, lessened interest on capital, and the constant demand, these will all come into active development. For every mine that "gives out," a hundred new ones are opened up. In California, as in Colorado, mining is the basic industry: when it flourishes, so with other pursuits; when it languishes, trade of all kinds is depressed. Every farmer, fruit grower, stock breeder, merchant and manufacturer in California is affected primarily by the condition of the mines. That they are of a permanent nature is a matter of congratulation to the State. The Pennsylvania man who wrote to the Amador, Cal., newspaper might do well to bear in mind that a well selected property in any mining State is a good investment, present or prospective.

On the Comstock.

The present war tax on mining stock sales and transfers will hasten the inevitable change on the Comstock, Nev., lode. The principal companies are now arranging for a reduction in the par value of the shares from \$100 to \$2.50 or \$1. From recent prices they might as well make the par value 10 cents or even 1 cent a share while they are about it, especially if the controlling idea be to evade the present prohibitory stamp tax. To completely get around that last requirement, however, all they need do is to go back to the original Comstock method of the early '70's and designate the property values by the "foot" instead of the "share." What is called "the South African system of stocking a mine," viz., organizing a \$1,000,000 capitalized corporation, with stock at \$1 per share, selling at two or three cents, originated a generation ago in California and its immediate success made many imitators. The difference between mining stock and industrial stock tends to justify such action. A corporation organizing to build a factory or a railroad or a mill figures on the amount of money required and the original capital stock approximates that amount. Ordinarily in the case of a mining company it makes small difference to the speculator whether the stock is one cent or \$10 a share, the gamble is the inducement, the dealers caring little as to actual par values, and low priced stocks giving increased chance for profit. This, of course, does not deal with the intrinsic value of the mine, the honesty of its owners or the ability of its superintendent; it being looked at from the speculative point of view.

At this time also comes up again for correct solution the proposition to drain the lower Comstock levels, originally suggested in these columns and editorially endorsed. That it should be done, and that the project presents no insuperable engineering difficulties, is agreed. The question resolves itself into one of ways and means, and how the money shall be raised is now the topic of discussion. To raise it by assessment is impossible. Securing federal aid has been suggested; the issue of bonds by the State of Nevada guaranteed by its Legislature has also been advocated. These are questions in which "the street" does not interest itself; if anything in the nature of investment in the property as a business proposition is done, it must manifestly be done by the owners. This is the one great obstacle, and what used to be the chief aid in Comstock development now becomes its chief hindrance. It was the stock gambling that enabled the Comstock bonanzas to be unearthed. Large sums were thus secured for bold ventures. Had it been private mine owners depending on the profits of ore on one level to go down another hundred feet, it is unlikely that the great feats of mining on that famous lode would ever have been accomplished, private owners being afraid or unable to take chances made possible by large public purchase of stocks. The public didn't care what men were paid or what machinery cost; they were only intent on "making a turn" on the stock, and this lavish indifference enabled the Comstock managers to make development investments that a private concern, not listed, would find ruinous. It was noticeable how the investing, gambling public, who knew little and cared less about the properties they gambled in, could do bolder and more successful mining than real miners with small resources. But now the same continuing spirit that fed the days of bonanza deserts the Comstock in the days of its borasca. The street no longer gives assistance, and upon the men who work the mines falls the burden of providing funds to rehabilitate them.

On page 105 is the conclusion of T. A. Rickard's article on "The minerals which accompany gold," etc., in which he decries the idea that, universally, mines are richer in depth. California experience disproves this idea, and goes far toward maintaining the affirmative. In this regard it must also be said that while the miner will oftentimes hear it said: "Greater depth will give you greater value," yet the old, practical miner rarely seeks greater depth, unless he finds value on the surface, or by systematic effort has first proved to his own satisfaction that by depth he will expose extensions of the ore body in which he or some one else has already taken values from the surface or near the surface.

Concentrates.

COMPARISON is constantly and cordially invited.

In Tuolumne Co., Cal., on June 23rd, 406 stamps were dropped on ore.

The Dexter, Tuscarora, Nev., directorate are looking for a new superintendent.

The Goldstone mine and mill at Lemhi, Idaho, are sold to Montana people for \$75,000.

The Rocky Fork Coal Co. at Red Lodge, Montana, is shipping coal at the rate of 1000 tons a day.

A \$10,000 addition to the mining building at the State University, Berkeley, Cal., is being erected.

It is calculated that there is in the United States to-day \$157,000,000 more gold than on July 30th, '97.

On the Comstock at Virginia, Nev., only four whistles now blow—the Union, Chollar, Overman and Alta.

The Crowned King M. Co. of Yavapai county, Ariz., paid \$24,000 in dividends during the month of June.

UNWATERING old mines in California is one of the kinds of mining work favored by the present dry season.

GREAT FALLS, MONTANA, will buy the water works from the company that has been operating them, for \$375,000.

CHOTEAU COUNTY, MONTANA, is building an irrigating dam at the Belknap Indian Agency that will cost \$40,000.

THE State of Washington has shipped 150 cases of ore samples to be exhibited at the Omaha, Neb., exposition.

When the machinery at the Chloride Point mill, Mercur, Utah, is completed it will handle 100 tons of ore daily.

MRS. JENNIE WALTHAM runs the hoist at the Golden Bar mine, Randsburg, Cal., and also acts as superintendent.

THE Dexter mine at Tuscarora, Nev., contemplates building an electric power plant. John Derr, Salt Lake City, Utah, is Pres. of the company.

AMADOR CO., Cal.'s, water ditch supply comes mostly from four lakes in Alpine Co., in the high Sierras, eighty miles east of Jackson, Cal.

THE ore at the El Refugio mine, Chihuahua, Mexico, goes 57% silver, 43% gold—about the same proportion as the Comstock in its prime.

AFTER the payment of the recently declared dividend the Pioneer Placer M. Co. of Placer Co., Cal., will have a cash surplus of about \$140,000.

NEARLY 11,000 workmen are employed by the mines of the lake copper district in Michigan. This is an increase of nearly 4000 men in four years.

JUDGE McDONALD of Spokane, Wash., has signed a decree disincorporating the Josie, B. C., G. M. Co. and releasing the trustees and officers from further liability.

THE Mercur, Utah, *Miner* issued a splendid illustrated edition in honor of the visit of the International Mining Congress delegates.

DURING July, Denver, Colo., and London, Eng., papers of the same date have been received at this office on the same day.

THE local executive committee of the Mining Congress, Salt Lake City, Utah, has decided to make the mineral exhibit of the congress permanent.

M. W. HARRINGTON got judgment for \$10,000 against the Eureka Hill M. Co., Eureka, Utah, for injuries received while in the employ of defendants.

FROM the Klondike, on the St. Paul and Roanoke, during July, came to San Francisco about \$2,300,000. Of this, the U. S. Mint coined \$500,000 direct.

THE Clear Creek, Colo., Power Co. has been incorporated—capital \$1,000,000—by Boston and Ohio men to build an electric power plant on Clear creek, Colo.

THE International Mining Congress' local committee of Salt Lake City, Utah, has authorized the publication of a complete stenographic report of the proceedings.

A NINE MILE SPUR TRACK will be built by the D. & R. G. R. R. from Leadville, with side tracks, to the Ibex and other large mines. It will be equipped by Oct. 1.

THAT for the first time in forty years no faro game is in operation on the Comstock, Nevada, is mournfully alluded to by the local press as the saddest and surest sign of decadence.

THOS. KERNS, the Park City, Utah, mine owner, has agreed to buy \$150,000 worth of bonds of the State of Utah. They are refunding bonds running twenty years and bear 3½ per cent interest.

COLORADO'S COMMISSIONER OF MINES LEE has prepared a needed bill to be presented to the next Legislature in regard to abandoned shafts in mining camps that have been left unprotected.

ANNUAL assessment work on unpatented mining claims is usually estimated by days' work at the ruling local rate. No allowance is made for time or expense going to or returning from the claim.

THE deepest gold mine in Tasmania is the Golden Gate—1330 feet vertical; in Victoria the Bendigo Goldfield, 3000 feet. The deepest shaft in Colorado is on the Geyser mine, Custer Co., 2556 feet.

EXCHANGE of foreign gold coin for United States money has never been much of a business in San Francisco, as foreigners upon arriving usually take their coin to the U. S. Mint and have it recoined at a trifling expense.

THE only published statement regarding the output of the Ulica mine, Calaveras Co., Cal., covered the period from Jan., '93, to Sept., '95, inclusive, during which time the yield was \$4,154,026.52, and the expenses \$1,683,414.24.

CARBONADO is used mainly in the form of diamond dust for polishing and in crystals for calking into the bits of diamond prospecting drills. It is not used in steel making, nor can it be used to "point" drills except as stated.

A "WET ORE" is one that has a high percentage of lead or copper—40% for instance, of lead, 20% copper. "Dry ores" contain but a very small percentage of either metal. Smelters do not generally pay for less than 5% of lead.

THE Centennial Eureka mine at Eureka, Utah, is installing an electric signal system in its shaft, which is 1400 feet deep, with a winze, making it 200 feet deeper. By this system it is believed that accidents will be reduced to a minimum.

ABOUT the busiest place in San Francisco upon the arrival of the steamer St. Paul from St. Michael was the assay office of the Selby Smelting and Lead Works, where a very large quantity of gold was deposited by returning Klondike miners.

CURRENT contemporary comment on the recent session of

the Mining Congress at Salt Lake City, Utah, is not favorable. Several valuable technical papers on mining topics were read, which are being published first in the MINING AND SCIENTIFIC PRESS.

THE recent claim of the Denver, Colorado, *Times*, that "Denver is the commercial and financial center of the Northwest," has started St. Paul, Minneapolis, Spokane and Seattle papers asking, "Where is the 'Northwest,' anyway?"

THE period within which annual work is required on an unpatented mining claim begins on the 1st day of January succeeding the date of location. Any one locating a claim since Jan. 1st, '98, has legally till Dec. 31st, '99, to do the requisite \$100 of work.

IN New Mexico considerable money is being put into placer mining, especially around Elizabethtown and La Belle. Meanwhile, as of old, dry washers are saving considerable gold for individuals who cannot command the requisite capital to undertake large enterprises.

AN off-hand rule for finding the required length of a belt is to add the diameter of the two pulleys, multiply the sum by 3½, divide the product by 2, add to the quotient twice the distance between the center of the shafts; the product will represent in feet the length required.

THE Omaha and Grant people who control the Pilot Bay, B. C., smelter, are waiting for the Crows' Nest pass railway to reach the Kootenay river to bring them coke and coal. When the road is built to that point they plan to start the smelter and resume work on their mining properties at Ainsworth.

DURING May, in Gilpin Co., Colo., Mgr. Rickard extracted from the Centennial mine, at about 500 feet below surface, 3000 tons of ore at an average cost of \$3.93 per ton for all charges, development, office expenses, ore treatment at mill and smelter. The value of the ore ranged from \$10 to \$100 per ton.

SOME of the difficulties of California mountain transportation of mine supplies were illustrated last week in the experience of L. Moore, who, in delivering a 5-stamp mill at the Globe mine, Canyon City, Cal., had to draw the machinery up with block and tackle over parts of the trail inaccessible to loaded pack mules.

A BUTTE, Montana, subscriber writes: "Any one of your regular ordinary weekly issues would be a specially fine edition of any other mining journal." The way that new subscriptions and renewals keep coming in, even in these times of war and drouth, coupled with many kindly comments, is naturally gratifying.

NOW that Wells-Fargo stain an honorable record for a generation by fighting the war tax of 1 cent and making their patrons pay it, support could justly be withheld. Packages of four pounds or less can be sent through the mails at oftentimes lesser rates than that charged by the old company whose dishonorable attitude excites surprise.

RECENTLY the recorder of San Bernardino Co., Cal., applied to the Superior Court for a writ of mandate to compel the recorder of Virginia Dale mining district to deliver to him all records of the district. The judge held that the mining law is constitutional, and directed the district recorder to turn all his records over to the county recorder.

THE Canadian Pacific Railway Company, that boomed the Stickeen river route to the interior of Alaska, to the material loss of hundreds of prospectors who tried it, has gone out of the Alaskan transportation business, which is very much to its credit. Other less pretentious and more fraudulent "transportation companies" should do likewise.

IN California gold ore carrying 65 cents per ton has been profitably worked. At the Spanish mine, Washington township, Nevada Co., in the month of November, in thirty working days Supt. F. W. Bradley mined and milled 4047 tons of ore. Including every detail of expense, the mining cost 31.4 cents per ton; similarly the milling cost 20.8 cents per ton—net profit 13 cents per ton.

A MINING transfer was recently filed in the Kittitas Co., Wash., auditor's office that required \$750 in revenue stamps to be affixed. It was a conveyance of Fish lake mining property and the par value of the stock was given as the consideration involved. It is very likely that the "consideration" will be considerably less when the parties have the chance to change it, which has been offered them.

A CHANNELL, superintendent Compagnie Salines et Mines de l'Altair, Mexico, reports an improvement in dry washers, combining a concentrator therewith, saving nearly all the gold and reducing 60 tons to 1. In that locality the dry placer ground goes about 45 cents to the ton, so that a 60 to 1 reduction would give a gold value of \$27 per ton of concentrates. The machine is locally stated to work satisfactorily.

GOOD babbitt metal is made by melting say 4 lbs. copper, to which is slowly added 12 lbs. Banca tin, 8 lbs. regulus of antimony and, subsequently, 12 lbs. more tin. After the first 4 or 5 lbs. of tin have been added, the heat should be reduced to a dull red, then add the remainder of the stated metal. This is for hardening. For lining 1 lb. of the above compound melted with 2 lbs. Banca tin will produce a lining metal of the proportions of copper, 4 lbs.; regulus of antimony, 8 lbs.; tin, 96 lbs.

ON page 110 the Yuba Co., Cal., special correspondence gives the latest phase of the "debris dams." The State and Federal government is in accord thereon, the money was long since appropriated and is available, and it would seem that the present low water would form a very desirable occasion for beginning the long-deferred work. This item, like a good many others in "Concentrates," is a condensed answer to a question by mail. In many such cases the question itself is sufficiently indicated by the answer.

THE California mineral land bill will claim congressional attention next winter. During the last session the bill was introduced by Senator Perkins in the Senate and Congressman De Vries in the House. The Secretary of the Interior and the Commissioner of the General Land Office reported in favor of it, the latter estimating the cost of compliance with its provisions at \$1,095,000. In the report favoring it from the House Committee the cost was estimated at \$300,000. Subsequently the commissioner accepted the reduced estimate as correct, and sent a letter to Congress endorsing the statement. Congressman Barham was given charge and had secured the promise of Speaker Reed to be recognized, when war matters swept all minor legislation to one side. Congressman De Vries says that the bill prepared by A. H. Ricketts affecting lands already patented to the railroad awaits the endorsement of the California State Miners' Association, but it is

understood that the latter bill will be pushed independently on its merits.

IF a locator has failed to comply with the law as required by the Revised Statutes, he has a remedy if he applies it in time. It is his duty if he desires to be protected, in the absence of any other location in compliance with law having been made upon the premises covered by his location, to relocate by legal subdivisions and record his claim just the same as if no location were ever made of the claim. But if he has failed to do this and others have located over his location, his right to the claim is forfeited and he cannot reclaim it, and to proceed against the junior locator in a court of jurisdiction will avail nothing.

R. T. WARD, manager of the Horsefly G. M. Co., 105 miles north of Ashcroft, in the Cariboo mining district, B. C., says that in three days from one flume they cleaned up over \$5000 and that the ground on bedrock will run from \$3 to \$5 to pan. The company has two hydraulic elevators and two monitors and uses electricity for lighting purposes. Its hydraulic plant complete cost \$102,000; sawmill and other improvements, \$50,000. The company has 380 acres of ground, has forty shafts to bedrock and, Manager Ward says, enough in sight to keep the plant in operation for twenty years. Mr. Ward has been working on this property for the past twenty years.

PROF. SILLIMAN and M. LAUR, a French engineer of mines, have described the ridge between the Middle and South Yuba rivers, Cal., and made some curious estimates of the amount of gold contained therein. Laur estimates that the region under consideration, worked at a rate which would yield \$12,000,000 of gold annually, would be exhausted only after a period of 524 years, which would give as the gold product over six thousand millions of dollars. The moderate estimate of Prof. Silliman gives the area of places where gravel deposits have been worked on this ridge as fifteen square miles, and its probable yield in gold is estimated at \$544,610,000.

THE "Electric Marine Salts Co.," North Lubec, Maine, claim to be producing gold from seawater aggregating \$2000 a week, at an expense of \$300 per week. This beats Dr. Emmons' production of gold from silver. The North Lubec people paid a 3% dividend on 500,000 shares stock July 15th. The company is capitalized at \$10,000,000, par value \$1 per share, said to be selling at \$1.50 per share. The company has a reservoir in into which the seawater flows and a sluiceway "in which are located accumulators which have chemicals which treat the water electrically," and through which the water "passes to waste in the ocean." The whole thing is given columns of serious comment in Eastern papers, and the statements are doubtless believed by people who like that sort of thing.

UNDER act of Congress, communities of Alaska miners can make their own laws. The miners' meetings in Alaska have generally made gulch claims 500 feet long, following the course of the stream and from rim to rim of the channel. The claims on Little Manook creek are 1000 feet long, having been located by men from Circle before the rush began, so that there was ample room for all. On Alder creek the length is 1320 feet—the legal limit. On the creeks which were discovered later the claims are 500 feet long, and in some cases where they had been done they were cut in two. There is no object on the Little Manook in making the claims wider than from rim to rim, for the only pay dirt is in the pay streak, which is well defined, from 20 to 30 feet wide and 1 to 3 feet thick on bedrock, which is 20 to 30 feet below the surface.

"CONCENTRATES" said last week that in a 5-stamp mill, 1, 5, 2, 4, 3 is considered a good arrangement, and gave some reasons therefor. E. B. Preston, who is good authority on that subject, says: "A good splash is one that shows a wave passing along the lower edge of the screen, moving backward and forward from end to end, or a similar wave motion that has its initial point from the center stamp. The succession most frequently adopted in California is 3, 5, 1, 4, 2; 1, 5, 2, 4, 3; 1, 3, 5, 2, 4, and 1, 4, 2, 5, 3; the last spreads the pulp very evenly from end to end. The greatest amount of discharge is obtained, apparently, by dropping the center stamp first; while the most crushing is done, other conditions being equal, by dropping the end ones first. Any arrangement of the stamps will answer, however, that distributes the pulp evenly and discharges it well."

WARNING has been sent out by the U. S. Treasury Department to all persons who contemplate going to the gold regions in Alaska and the Northwest Territory to beware of fraudulent transportation companies. Three cases have been brought to the attention of the department where cleverly worked contracts promised not only to bring the gold seekers into the Klondike, but also to furnish them with the necessary equipments and supplies. In many cases a list of bankers and business men, who were located as a rule in Europe or Mexico, is appended to the prospectus as references. Instead of taking the promised care of the passengers, the wily employees of the transportation companies have carried them up to some northern port and there abandoned them. As a rule, the price charged for transportation and all other accommodations has approximated \$500. It costs less than \$75 to carry passengers to these points.

GENERAL MGR. HUNTLEY's report of the operations of the De Lamar, Idaho, Mining Co. for the year ending March 31st, '98, was read at the London meeting on the 28th ult. Ninety thousand three hundred and five tons of ore, with an average assay value of \$12.26 gold and \$2.16 silver, yielded \$464,523; 30,000 tons sent to smelters yielded \$13,049; the total cost of the year's operations was \$415,701. Of the Pelatin-Clerici process plant Mr. Huntley says: "This 50-ton plant commenced operations June 6th, '97, and ran quite successfully until February 6th, '98, when it was shut down with the rest of the mill machinery. Although its first cost was considerable, it saved much of it, showing a marked decrease in the general milling cost per ton, as will be seen by a comparison of this with former years. It has not been dismantled like the pan mill, in reorganizing the works for leaching, in hopes that it may some time be of service. It was a step in the right direction, but not far enough. The shutting down of this and the pan amalgamation mill was not because of the failure of either, but was due to local costs and conditions at De Lamar and the decreased ore values." The total cost of operation was \$9.53 per dry ton. Another cyanide plant now about completed will, it is expected, reduce the general milling cost nearly \$2 per ton. During the last seven years the mine has paid from 2½ to 25% net annual dividends.

Advanced Methods of Concentration.

An extempore address by J. W. NEILL of Utah, at the Salt Lake Session of the International Mining Congress, July, '98, and specially reported for the MINING AND SCIENTIFIC PRESS.

The ideas I wish to present are perhaps largely personal or based upon observation and some investigation on the subject of concentration, which affects the miner when his high-grade shipping ore has been exhausted and he gets down to the "dumps" to his low-grade ore. As long as he can ship his ore to the smelter direct the subject of concentration does not affect it.

In Utah we are particularly fortunate in that our camps surround our valley at a distance ranging from twenty to forty miles, so that the cost of transportation from the mine to the smelter is small. Our smelting works are equipped with the latest machinery and the charges are always moderate. The question of concentration therefore, has presented itself to us in Utah only within the last few years. I think it has been developed in Utah in a manner which will interest many of you, and I hope that most of you will take advantage of the different excursions to see the mills which are now in operation in Bingham and other places.

By concentration the operation is what might ordinarily be called "ore dressing" as it is generally understood. I intend to include in my remarks on the subject not only the wet concentration of ores, but also that concentration which is known as the matte smelting, which I believe to be as important a branch of art as the wet concentration, and one which has been neglected. Wet concentration is almost entirely based upon the difference in specific gravity between the minerals carrying the metals and the values of waste material the gangue recovered. In other words, we have different earthy materials with their gravity approximating two and a half units of specific gravity; we have galena with seven and a half to eight; we have pyrites of iron and copper with a gravity of four and a half to five; the other metals ranging in between the two. Now, this difference, we will say, of two units or two and a fraction of units of specific gravity and the separation between the earthy materials and the valuable materials can be readily affected by means of concentration. These ores are in the rough. First, by a crushing of the ore, to reduce it to a suitable size so that this difference in specific gravity can be brought to bear; that is to say, if I have a piece of quartz the size of this pitcher and a piece of galena of the size of the glass of water they may actually weigh the same. The specific gravity of those two would therefore be the same. To separate them I must reduce everything so that the particles of the same size are subjected to the same operation, as in that condition the specific gravity can work and we make our separation. I do not intend to go into details on the ordinary concentration methods at all. The general methods of reducing the ore are well known, and then separating it by means of tables of the various kinds, vanners and other machines. Advances in the machinery line have been general. Possibly the most interesting of late and one which has made quite a stir has been the Wilfley table, which is being quite largely introduced. The separation of minerals which are close in their specific gravity, for instance the iron pyrites, zinc, etc., where the difference is only a fraction of a unit is far more difficult. To attain this result in the older works, as in Germany, where labor is very much cheaper, the separation is effected at the start of the operation before the ore is introduced into the machinery at all, and is effected by means of hand sorting. In one of the works which I have in mind, one of the largest concentration works in the world which was erected some fifteen or twenty years ago at a cost of \$1,500,000, they employ from 450 to 500 boys from the ages of eight to fifteen years who sort these minerals from the rock. In other words, the German knows that he cannot by his mechanical means separate these minerals so close to specific gravity; therefore he takes time by the forelock and before the ore is crushed too fine he sorts out the pyrites from the rest of the material and provides a separate treatment by itself. In this country that would be practically impossible.

In Germany, we are taught, or were taught a study there that metallurgy was the science of extracting metals from the ores. In this country we learn by experience that metallurgy must be the science of extracting the money from the ore. The difference between the two is a very important one.

Of all the advances which have been made in the matter of concentrating methods one, that was widely known and advertised about two years ago, I would like call your attention to, and that is the Peck centrifugal concentrator.

Mr. Peck of Chicago developed the idea that by giving the material to be separated a great acceleration the difference in specific gravity being all multiplied by the same figure would be greater, and that by this means the separation could be more readily effected.

He worked upon this for a number of years and spent a great deal of money. I do not think I am

exaggerating when I say that there has been at least \$500,000 spent in development of this process. He changed his first apparatus radically and absolutely from a vertical cylinder to a horizontal cylinder. This process, at the time it was heard from very much, was noised abroad as a curio; for it handled ore and saved 100 per cent and did it for a certain number of cents per ton. These claims have since been abandoned I think. Those of us who have had the privilege of seeing the machine recognized its good points and its shortcomings. As many of you many not have seen it, and as the opportunity will not be given in Utah, I will describe it as merely a horizontal cylinder, larger at one end than the other; the cylinder 12 to 18 feet long and 4 feet in diameter, of hammered steel, turned as true as a watch crystal, is made to revolve in massive bearings with a speed of from 600 to 1000 revolutions a minute. Inside of this cylinder is another of slightly smaller dimensions made of wood, which revolves upon other bearings, revolving inside of the bearings of the main steel cylinder. It is driven by belting and is arranged by delicate machinery to be absolutely under the control of the operator. To this cylinder the pulp of ore is laid on certain pipes controlling their valves and the material from the cylinder is discharged out of the opposite end into other valves and suitably arranged for carrying off the waste material and also the concentrates from the cylinder.

Imagine yourselves, therefore, this cylinder, revolving in that direction and the other cylinder within it revolving in the same direction; the outside one at a speed, we will say of 700 revolutions a minute, and the inside one at a slightly less speed, the pulp fed in from the left side. It is at once taken up by the cylinder and given this enormous velocity; the materials are thrown violently against the perforator of the cylinder, the heavier materials are there held while the violent agitation set up by the slower motion of the inside cylinder washes out and delivers the sands at the other end of the cylinder.

That operation is continued for a few minutes at a time. As the concentrates accumulate in the cylinder against the walls, to which they adhere very compactly, the inside wooden cylinder gradually recedes, the delicate machinery being so adjusted that its rate of recession is exactly in proportion to the amount of concentrates it has accumulated. In this way the space between the wooden cylinder and the outside cylinder remains about from half an inch to three-eighths of an inch. When the charge of concentrates has been collected in the cylinder the ore stream is shut off and the outer cylinder is slowed up. Instead of then running at 700 or 800 revolutions, it has slowed up to 300 or 400. The inside cylinder continues to operate at the same speed and, of course, a contrary motion is set up inside, which at once loosens the particles all over from the sides of the cylinder, and they are discharged in turn into another trough, where they are settled. In this way the operation of the cylinder goes on, first loading, then discharging.

As I saw the machine operating, it was taking from thirteen to twenty-one minutes to load and from five to twelve minutes to discharge it. It was concentrating about seven and one-half to ten tons of slime to one ton of concentrates, and the saving which was being made was told me, and I took some samples from it and an assay was made, which would indicate that a saving of from 60 to 80 per cent was being effected.

The material upon which this machine was working, I must state, had all been so reduced that it would pass a 100-mesh screen, this screen having 10,000 apertures to the square inch. That means that this machine needs for the successful operation a practical pulp. The material is floured to the finest degree; it is absolutely necessary for the operation of the machine that it should be in that condition. It is apparent to those conversant with hard ores that the comminution of a large amount of material to this fineness is a very expensive operation.

That has been the cause of the failure of the machine where it has been applied to the handling of raw crude ores, and I think will always be an obstacle in its application to such ores as a concentrating machine by itself.

The machine has been very successful, however, in the handling of pulps which were suitable to it, such pulps arising from the handling of crude ores by other methods, such as pulp tailings from concentrates and tailings from the old pan amalgamation on the Comstock. On the Comstock one of these mills handled up to 270 tons per day, every cylinder producing concentrates at a rate of about twenty-seven tons, in that manner a saving of over 80 per cent in the values produced from tailings.

This machine, therefore, which was held to be a curio, I do not hesitate to pronounce an advance in methods of concentration when applied to the right place. By that I mean that with this machine from a business basis the mine owner who wishes to concentrate his ores, and who already knows his ores will slime, need not fear to crush those ores to the necessary point of comminution in order to effect separation of pulp and slimes which he will make. Give him a centrifugal concentrator at the end of his mill, and I believe that the separation or concentra-

tion saved will more than counterbalance the cost of the operation. That, of course, is a question of dollars and cents. I would say that the cylinder takes a great deal of power, about 115 H. P., and it handles on sulphiding ores about 1510 tons; and, as I said before, the manner of concentrating ore which is less metallic contain from twenty-five to thirty in one. Many of you who are acquainted with concentrating propositions will realize the possibilities which this machine would give. I would also suggest in this same line that one gentleman here has said that in Mercur there are 500,000,000 tons of \$2 ore exposed. Many of us who have had experience with the Mercur ores are aware that those ores slime very badly; that they are apt to percolate on account of this slime, and that the gold values could not be saved. Might it not be possible to crush these ores with it, take the slime resulting from this wet substance and run them through such a centrifugal concentrator and make a material which would pay to handle with cyanide or some treatment, or possibly by direct shipment to the smelter?

These are some of the thoughts I wish to present in a general line. The ordinary process of wet concentration is, as I have said before, an ore dressing, and the material which is usually produced is sent to some smelting works for further treatment. There are many kinds of ore which are apparently not fitted at all for concentration. The Tintic district of Utah is one of these. The ores from the Eureka Hill, from the Mammoth Sue and the others, to my observation, did not seem to be in the least suited to concentration. Yet, at the present time there are in operation in Tintic three very large mills, one of 100, one of 60 and one of 40 stamps, which are successfully operated to-day upon the ores of Tintic, and not by concentration which we know locally as the combination process and the other. By this method the ore is stamped, passed over to the amalgamator, and the pulp finally passed through the vanners, where a percentage of the value is saved in the shape of concentrates. The pulp is passed from these vanners into the tailing pits, where it is accumulated. From these it is passed on to pans, where it is amalgamated. The values, or as much as possible of the values, saved by raw amalgamation and the tailings are then passed out. The first mill that I know of on this plan was built in 1881. The process was brought more prominently to notice in the working of the Montana Company's mill at the Drum Lummon mine at Marysvale, Montana, and was introduced into this State by Mr. Robinson, who came here from Montana to introduce it. These mills handle from two and a half to three tons to the stamp. They save from about 65 to 80 per cent of the metal values of the ores. Of this amount, taking 80 per cent as the saving, 50 per cent of savings in the pan and on the plates is shipped as bullion—silver bullion in this case. Owing to the nature of the case that bullion is, I fancy, from sixty to seventy fine. The balance of the material is shipped as concentrates, carrying from a few per cent up to 30 per cent of lead, from twenty to sixty ounces silver, and from \$5 to \$15 in gold. This material is bought at good figures by the local smelters and all the smelters of Colorado, and the cost of marketing this product or marketing the bullion in this way is \$1 a ton on the crude ore. The mills are handling their material at a cost of \$2.50 to \$3.50 per ton on the ore, which, with the other dollar added, would make it from \$3.50 to \$4 per ton on the crude ore. They are, I might say, to-day the life of that camp. Without these mills the ore of the value of \$15 per ton would be of no value whatsoever to them, as the cost of milling and freight to the Tintic miners is ordinarily about the same per ton. The revenue which they bring to their companies is undoubtedly sufficient to pay for the extraction of the high-grade ore which goes to market. This is a process which embodies concentration of ore dressing with the actual recovery of silver in bullion values.

I would like to call your attention to another method, another combination of processes, which, while it is not in commercial use as this process is at Tintic, is yet of sufficient interest to you all to deserve a brief mention; and that is the process or method for treating mixed ores carrying iron pyrites, galena, zinc, copper, pyrites, all the sulphides of the metals which are now so valuable to us here in Utah. This character of ore is most common and best known to us in Utah as occurring in Bingham. The ordinary wet concentration of this ore gives us a concentrate carrying, we will say, on an average of 20 per cent of lead, 5 to 15 per cent of zinc, 20 per cent of iron and a few per cent of salina. This material is of course bought by the smelters. If there is any copper contained in the pyrites associated with this galena, that copper enters the concentrates, and the local habits have always heretofore been that both copper and lead are not paid for in the same ore. Therefore, either the copper or the lead is lost, or only one paid for by a very largely reduced price. The method which I am going to describe to you was invented and has been developed by myself quite largely. It consists in taking the ore as it comes from the mine and subjecting it to a roasting or heating process or operation. This roasting or heat-

ing operation, I must say after the ore, of course, has been crushed, as carried out in any of the well known furnaces, is only carried to the stage where the free sulphur and pyrites, either copper or iron, burns with a blue flame and gives sufficient heat to carry on the operation in nearly all the Bingham ores; and when this flame has disappeared and the ore is all a deep dark red color of heat the operation is finished. If the ore is withdrawn from the furnace at this stage and tested, it will be found that in the material which has heretofore been non-magnetic, the iron has become magnetized. It can, therefore, be separated from the other minerals, the galena, the glen and gangue, and this separation is practically complete as far as the mechanical separation has been made by the crusher. This operation, therefore, gives us at the first start iron concentrate of high grade, carrying very little lead and zinc and copper and little saline. The tailings from that operation contain the lead and the glen unchanged, and they are now in an admirable condition to be separated by ordinary methods of wet concentration. The iron is in an admirable condition for further treatment, and the saving in freight and smelting charges on this material is in the most cases sufficient to pay for the operation of roasting. By this method I have handled copper ores turning out tailings which run a trace of silver and gold and less than two-tenths of one per cent copper. I have made separations between glen and iron pyrites by which 47 per cent of iron and glen, 47 per cent zinc, has been turned out with the first operation.

It is needless to call the attention of these gentlemen in the region of this arid West to the advantages which this process would give in districts where water is scarce. The concentrates are given to us in a condensed form and are at once a shipping product. Of course, applied to ores carrying gold and other metals that are contained in the pyrites, the saving is only to that extent; but it leaves the material left behind in an admirable shape for amalgamation or for cyanidation.

These, then, would be steps in concentration, suggested. The concentration by fire, as known to most of us as pyritic smelting, deserves in Utah more attention than it has received. Particularly is this method adapted to the treatment of Tintic ores, which are being treated by the combination process, and many others which are not being treated at all. By this method the ore is treated in many places in the State. It is in use in the Tasmania and 500 tons a day are being treated by it. And in this method concentration can be effected in accordance with the degree of silver contained in the ore at the start.

In other words, in the ores that are heavy in silver the process would be more directly a pyritic smelting. It is needless to point out the advantages of this method. The costs of plant are less than those for the large combination mills, that would handle the same kind of ore by nearly half. The cost of treatment will not exceed those of the combination mill more than a couple of dollars a ton. I think there are many gentlemen present who will undertake to erect mud mills which handle 150 tons and do it at a cost not to exceed \$5 a ton. It figures itself down, therefore, in a proposition of this kind—95 per cent of \$15 as a certain given figure, less \$5 for the smelting; multiply that same number (\$15) by 75 or 80 per cent of values of the mill; take from this cost of the same process, cost of handling and concentration, and it will soon figure itself out which process will give the most money in a case of this kind. There are to-day in Tintic many thousands of tons of low grade ore, \$15 and less, waiting to be carried out and realized on. At the same time, there are awaiting the same treatment in Tintic and in Bingham other thousands and thousands of tons of pyritic ore which would act as fuel and as flux for these same ores. They are waiting for the brains and the dash combined to act upon them. Those of you who go on the excursion to Bingham will see the pyrites there in most extraordinary abundance. Those of you who go to Tintic will be probably informed by those posted in that district that there is a zone in the mountains there from 900 to 1200 feet wide, which will practically carry all the way across ores in value of \$9. Of course, there are places which do not carry it, but that is probably an average, at any rate, of that vast territory; and I venture to say if all this ore were to be handled and added to the large amount of pay ore now handled that the expansion to our Utah industries would be a very pleasurable thing for us all to witness.

I have no notes with me, and I fear I have exhausted your patience and will draw to a close. I am much obliged for your time and attention.

Mr. Christy (Cal.): I would like to ask what the cost is per ton for treating tailings by the Peck process?

Mr. Neill: My own experience of the Peck process is that it can be made at a cost of \$2 to make this thing operative. Of course, the exact cost cannot be ascertained. I would say from what I have heard that the cost was less than \$1. It averaged between, say, 85 and 95 cents under certain conditions.

Mr. Cutting (Nevada): I can say something about the Peck process. In one mill where the Peck process was worked they saved less than 50 per cent. New machinery was put in, and on the tailings

where the Peck process was a failure they are now working tailings with the old pan mill process and also the cyanide process. So we can hardly agree with the gentleman that the Peck process of concentration is a step in advance.

Mr. Esler: I would say that I am from Montana, where they put in a 500-stamp Peck mill, that resulted by experiment in about 100 tons capacity, and it has been so successful that, at first being 100-ton capacity, they are now putting up a mill of 500-ton capacity. It has been a perfect and great success there.

The Minerals Which Accompany Gold and Their Bearings upon the Richness of Ore Deposits.*

NUMBER II.—CONCLUDED.

By T. A. RICKARD, State Geologist Colorado.

To say that mines get richer in depth is, in such a region as West Australia, a cruel cynicism. If anyone is inclined to believe it, let him wander over the desert and count the idle stamp mills which lie rusting in the sweltering sun, and the long succession of abandoned shafts which now serve only to water the passing camel train.

A general hypothesis that the gold in the oxidized ore has been leached out so that it is beneath its normal richness, which will be found unimpaired below the water level, is stated to be evidenced by the removal of the iron pyrites, the cast of the crystals of which now appear as cavities in the quartz. In some of these gold is found, but in others it is absent, proving, so it is said, that the gold has been removed from the cavities which are now empty. The occurrence of films of fine gold, called "paint gold," on the face of fractures is instanced as an illustration of secondary reactions. Finally, the alkaline composition of the waters in the mines is quoted in proof of their solvent power.

Although the chemistry of the oxidized zone is far from being thoroughly understood, yet in its incompleteness it is sufficient to disprove these arguments. When iron pyrites is decomposed the sulphide becomes a sulphate, and this in turn, by further oxidation in the presence of water, is resolved into sulphuric acid and the hydrated oxide of iron. The native sulphur frequently seen in the cavities left by the removal of the cubes of pyrites is not a direct product of decomposition, but is traceable to later secondary reactions in which the organic matter of the surface has served as a reducing agent. The gold intimately mixed with the pyrites, and probably originally deposited with it, remains, because the noble metal is insoluble to the waters which dissolved the iron.

The occurrence of gold in pyrites is now less of a mystery than it used to be. Microscopic examination has disclosed the existence of the gold in the planes of the pyrites, and the leaching of the gold by cyanide solutions without any apparent deformation of the pyrites is no less suggestive. It is, indeed, true that in some of the casts left by the removal of the sulphides gold does not occur, but this is frequently due to the fact that it is very difficult to break a piece of cellular quartz without shaking the gold out of the cavities in which it lies loosely. Hence their emptiness may mean nothing. At other times this may, indeed, be due to the real absence of the gold, and against this observation we then balance another—namely, that the pyrites as we find it unaltered below the water level also varies in its gold contents, so that in the same vein it is sometimes barren and sometimes rich, accounting in this way for the uncertain presence of free gold in the oxidized zone. The "paint gold," frequently noticed in the gossan, appears to be the result of secondary and comparatively recent reactions. It is, however, only a proof of precipitation, and, therefore, presupposes a previous leaching, but not necessarily in the vadose region. It evidences local enrichment rather than impoverishment.

Of the solvent power of surface waters upon the gold there is only supposition, and this supposition must first overcome the fact of the occurrence of such organic matter in the ground approaching the surface as would reduce any known salts of gold should they be in solution. In the Sugarloaf mine, near Kunanalling, I saw the roots of trees at 74 feet, and in the Great Boulder Main Reef mine, at Kalgoorlie, I saw some which had penetrated the rock to 85 feet below the surface. In the former case the oxidation of the enclosing rock ceases at 130 feet, and in the latter at 175 feet. The region is an unusually dry one, which has undergone erosion with extreme slowness; and this is doubtless the reason why roots in search of moisture should penetrate so deeply.

The waters of the mines are all brackish; they are many times more salt than the sea. Analyses made at the Great Boulder Proprietary mine exhibit the following results: Solids, 8.9 per cent, and of this 6.2 per cent was chloride of sodium, 0.45 chloride of magnesia, and 0.73 sulphate of lime. The water

*Condensed from a paper read before the Institution of Mining and Metallurgy.

from the Lane shaft gave the maxima of 11.9 per cent solids, containing 8.8 NaCl, 0.51 MgCl₂, and 1.1 CaSO₄.

Certain results obtained in the treatment of the zinc precipitate in the cyanide works of the Associated mines have led the mill manager, Mr. Grayson, to deduce the solubility of gold in sulphuric acid when tellurium oxide is also present, and thus to offer a chemical theory for the alleged leaching of gold in the surface ores. As it stands this theory is questionable, because the solubility of gold under the conditions stated is not known; but Mr. Richard Pearce, in a recent letter, has drawn my attention to the fact that such solubility would occur when free chlorine is liberated, as would be the case, it may now be pointed out, when sulphuric acids and chlorides are brought together in the presence of tellurium oxide, which would then take the part usually given to the black oxide of manganese. The occurrence, therefore, of waters rich in chlorides, of sulphuric acid derived from decomposing pyrites and of tellurium oxide obtained from the oxidation of tellurides, are all recognizable amid the conditions at Kalgoorlie, and thus afford a theory which, while it has no very strong evidence to commend it, is at least tenable from a chemical standpoint.

In many cases the supposed enrichment in depth can be easily explained. For example, a shaft passes, in course of sinking, from poor into rich ore. The lode, it would appear, has become better in depth. The fact is that the shaft was started off the ore shoot, which has a pitch such as to bring it across the line of the shaft at a certain level.

It would be just as reasonable to argue that the ore occurred in vertical bands because the levels pass in and out of the shoots. In another suggestive instance a vertical shaft was sunk in a very wide lode which is not quite perpendicular. The shaft was started on the hanging wall side, where the ore is now known to be always poor, and in depth it approached the foot wall, where the lode is richest. It was assumed for a time that an enrichment in depth characterized the lode.

The extensive development of the gold field has afforded an explanation of the checkered nature of the early explorations. It has been found that the quartzose lodes are uniformly poor, and that the rich ones have a chloritic and magnesian matrix, which renders them susceptible to easy degradation and erosion. Thus it is easy to understand the current misunderstanding. The first veins worked were naturally those which had outcrops. They outcropped because they carried much quartz, and were harder than the enclosing country. They also happened to be poor; therefore, the first attempts at mining were unprofitable. On the other hand, the rich lode had a composition into which the carbonates of lime and magnesia entered largely, rendering them softer than the rock enclosing them, and, therefore, they suffered erosion at least as rapidly as the surrounding country. The detrital deposits of the surface capped the tops of the rich ore bodies, and it was not until an accidental exploration had pierced the cap of this "cement" that the first of the soft and rich lodes was uncovered. The discovery of the others followed in due course.

The idea of an enrichment in depth was based on the fact that the mines, which were at first unprofitable, became subsequently marvelous ore producers. Careless observation and that wishing which is father to much loose thinking served to bolster up an erroneous idea, and to spread the statement that the ore became richer at the water level. It is a matter which does not affect the reputation of the really good mines so much as that of the forlorn hopes, the poverty of which is excused by a lack of depth, thus leading directly to the spending of much money on the foundation of a fallacy.

From a careful investigation into the matter and the sifting of much evidence I was forced to the conclusion that Kalgoorlie was no *lucus à natura*, and that where rare enrichments occurred in the sinking of a shaft the fact could be traced to the structural relations of the ore deposits. I regret the conclusion. It would have encouraged those in other regions had there at last been found a district where Nature had placed the best ore where man could with most difficulty reach it, and, apart from its economic aspects, the occurrence would have been one of transcendent scientific interest.

Thus the tellurides, like rhodochrosite, tourmaline, zinc blende, pyrites, and a host of other supposed indicative minerals, must be discarded as helps no better than the will-o'-the-wisp, which leads the wanderer into a morass worse than the darkness itself. Better no guide at all than a false one.

But those who invest in mines may ask whether I would deny that there are men of such ability and experience that they can come to safe conclusions as to the prospective value of a mine from the character of the ore. To this I would answer that I know of no such short cuts to the valuation of mines. A moil and a four-pound hammer are of more use than a book full of sounding theories; a careful sampling of the workings is of more immediate utility than a treatise on mineralogy. Successful mining must be based on facts; all the rhetoric and fond imagining in the world cannot alter them. It is the province of the mining engineer to determine the facts, to

get alongside them, as Huxley would say, and when a theory comes floating by leave it, as Joseph left his coat in the hands of the harlot, and flee. Experience has proved that indicative minerals are delusive; so let them go. But the mineral contents of an ore, though they have no bearing on the mining, decide its metallurgical treatment, and, therefore, need careful examination. The importance of the character of the ore from this point of view is too often overlooked by those enthusiastic mineralogists who permit themselves to make the most sweeping deductions on matters of much greater uncertainty.

Careful sampling is worth a bushel of suppositions, and the painstaking determination of the working costs is better than any amount of geological generalization. Mining is not a scientific pursuit, although at times it may to the observant have seemed to be either that or one big insanity. But mining is an industry. The good sense which financial men have of late years contributed to its operations has done much to bring it from a windy mistiness to the solid footing of a sound business. The main purpose is not to develop the waste places of the earth, nor to spoil the scenery of the mountainous ones, but simply to win a profit by extracting ores out of the ground. It is a plain matter of profit and loss. On the one side is the value of the gold in the ore, and on the other is the cost of the processes needed to obtain it. To arrive at the former there is only one way—namely, to sample the workings systematically. The result will be reliable in proportion to the care taken. Any shirking of difficult places in the mine, any avoidance of hard portions of the vein, any assistance from untrustworthy hands, will vitiate the result. Against this must be placed the cost of operation. Here it is that experience is needed. The sampling is largely mechanical, like assaying, and requires patience and care more than anything else. In the estimate of the costs there have to be included many items of expenditure, such as the breaking of the ore, the development work, the equipment, the milling, the management; and to arrive at these the previous actual charge of mines is the only proper preparation. Then comes the question of the quantity of ore available, or likely to become available, by further exploration. This is the *pons asinorum* of mining. That which some describe as ore in sight is often really ore out of sight. The over sanguine estimation of ore reserves has ruined more enterprises than all the bad management and over capitalization of which complaints are daily made. It is ever a difficult matter and requires cool judgment, wide experience, and a careful investigation into the circumstances and structure of each particular mine.

When the value and tonnage of the ore available have been arrived at, and when working costs have been determined, then the engineer has nine-tenths of the evidence needed to submit to the client whom he is advising. The other data which will influence an opinion are more uncertain in their character. The geological considerations may affect the cost of mining, and the mineralogical the expense of milling. As such they must not be overlooked, but the padding of a report with a large amount of geological disquisition, where it is not immediately *ad rem*, is very nearly an impertinence, seeing that it is not expected that it will be understood by the person or persons for whose guidance the report is written.

In concluding this contribution I would express the hope that it may lead to a useful discussion. If there be any technical men who seriously entertain the idea of an enrichment in depth due to the leaching of gold in the oxidized ores, then it would be of much service to the industry if they would frame a defence and an explanation of views which daily experience must otherwise condemn as nonsense. Nor in denouncing one generalization would I make the equally grave mistake of advocating its opposite—namely, that all mines must necessarily become poorer in depth. There may be causes, founded on geological structure, why a change in the value of the ore in a vein may take place in any direction, upward or downward, in dip or strike, and it is an undoubted fact that there have been instances where an increase in depth has led to the discovery of richer ore. Bendigo is a telling illustration. The gold-bearing quartz occurs along the anticlinal axes of sedimentary rocks. In sinking a succession of saddle formations is penetrated. No single one of these has any notable vertical extent, yet the series as a whole is wonderfully persistent. This explains why the last resort of a perplexed mine manager is to advise the sinking of the main shaft. At Bendigo the advice is well founded, but when the managers from this district go to West Australia and recommend deeper exploration every time they encounter poor ore, they do so without regard to the total unlikelihood of the conditions. Again, it cannot be denied that in certain regions alterations of comparative richness and poverty appear to coincide with the penetration of the workings through successive zones of rock. The Gympie district is a case in point. There the veins cut through a series of shales, limestones, conglomerates and sandstones amid which there are several beds of black slate. The gold occurs in paying quantity only when the veins are traversing the slates. Every district deserves a study unbiased by the record of its neighbors; each

mine must be taken on its merits and inspected without predudice. It is, however, one thing to examine a mine with the assumption that gold veins in general become enriched in depth, and it is quite another thing to recognize that while it may occur in a particular case, it is an expectation which experience does not justify.

In closing, let me state again the problem which I set out to discuss, namely—Whether the occurrence in the ore of certain minerals can be trustworthy evidence in arriving at the prospective value of a lode only incompletely developed and in a new country. Please note that it is of a young mine rather a mere outcrop that I speak, and that I deal with a new region and one in which the experience of many mines has tested the value of such evidence. Nor do I refer to the enclosing rock, but to the minerals in the ore itself, for to me the character, and especially that structure of the rocky encasement of a vein, has a bearing many times more important than any mineralization.

The Anaconda Self-Oiling Axle.

The Anaconda self-oiling car axle, patented April 20, 1897, for mining cars and narrow-gauge cars for contractors, furnace and industrial use, is made in halves, both wheels being pressed on. A cast-iron sleeve serves as a support for the axle and as an oil reservoir. This sleeve is bored to fit the axle. The center part, for two-thirds of the length of the sleeve, is counter-bored to provide ample oil space. The sleeve enters about 1½ inches into the hub of each wheel, with a sufficiently close fit to prevent the loss of oil. The object in having the axle divided in the center is mainly to allow for variations of travel in passing around curves, also to be able to press the wheels separately on each half-axle: 1½-inch cold rolled steel is used for the axles, being slightly tapered at one end before the wheels are pressed on; the other end of the half-axle is provided

with a groove, into which is placed a small fork-shaped brass casting straddling the axle and serving to hold same in position. At the center the sleeve is enlarged and provided with an opening of sufficient size to let the two forks drop in. A pressed wrought steel cover is hinged over this opening, serving to retain the forks in position and to keep out dust and dirt. This cover can be readily slipped to one side to permit oiling, or, when it may be necessary, to take out the forks and remove the wheels and axles. Each sleeve is provided with two lugs for attaching either wooden or iron car bodies. All parts are made to exact gauges, and are interchangeable. Oiling is necessary once in three or four weeks, and no other attention is required.

Over 5000 cars equipped with these axles are being used by the Anaconda Copper Mining Co. in Montana. They are also in use at other mines in the western States. Axles are made to suit 18 inch, 20-inch, or 24-inch gauges. Wheels of any type and either 10-inch or 12-inch in diameter can be supplied. The wheel usually furnished is 12-inch in diameter with chilled tread, of form as shown in cut, by the American Engineering Works, 204 Dearborn St., Chicago, Ill., who keep a number on hand for immediate shipment, and also keep all necessary parts for repairs.

A set, consisting of four wheels with axles, sleeves, etc., complete, for 18-inch gauge with 12-inch wheels, as shown in cut, weighs about 320 pounds.

ONE PER CENT of aluminum in brass is very extensively used for electrical purposes, as it gives a brass casting free from pinholes, and of greater strength than can be secured otherwise from the same grade of brass. It follows, therefore, that by the use of a small percentage of aluminum in brass a cheaper grade can be used to do the same work than would otherwise be possible. In cases where maximum results are desired, care must be taken that only pure metals are used. Much of the copper and zinc commonly used contain considerable amounts of impuri-

ties, and the nature of some of these absolutely prevents the production of good alloys with aluminum. In all cases an analysis of the metal supplied should be demanded, and for aluminum alloys, to exclude all containing more than one-fourth per cent of iron, arsenic or antimony, or more than two-hundredths of per cent of bismuth.

Gas Engine Experiments.

The explosion of the gas in the cylinder of a gas engine produces great heat, part of which is employed in expanding the products of combustion and making them move the piston. P. Pinckney has conceived the idea of combining a steam and a gas cylinder tandem fashion and making the water jacket of the gas cylinder serve as a boiler to supply steam to the steam cylinder. To do this he makes the piston of the gas cylinder double, with a water space between. This communicates with the jacket, but the stroke of the gas cylinder is so arranged that the jacket never comes into communication with the gas space of the cylinder. The object of the water piston is to make use of a larger part of the heating surface of the cylinder than is reached by the jacket alone. A proper feed has to be arranged to maintain the requisite quantity of water in the jacket as portions of it become converted into steam.

The noise and odor of gas and petroleum engines have, it is reported, been considerably suppressed by M. Chevalet, who places inside of or on the top of the cast-iron chamber in which the products of the explosion are generally received a few scrubber rings, such as are used in gasworks. A considerable diminution of the noise was effected by a scrubber 40 cm. (15½ inches) diameter placed over a 3½ H. P. petroleum engine and also upon a 1 H. P. gas engine.

COMPOUND pipe, consisting of a cast-iron tube bound with wire, invented by M. R. Jacquemart of Meurthe-et-Moselle, is being used for a water main in the Oise valley, France. It is stated that this system permits the use of pipes 6 feet 7 inches in diameter, with a thickness of only ¼ of an inch for tolerably high pressures, 13-foot lengths of this diameter weighing only four and one-half tons. They are cast with five rings or bands, 8 inches wide and ½ inch thick, for keeping the wire winding in place, which is effected with steel wire ¼ inch in diameter, annealed and galvanized, there being a layer of asphalt between the wire and the cast iron. As soon as the pipe is taken out of its mold it is put into a lathe, and one end of the steel wire is fixed in the cast iron. By revolving the pipe on its axis it is wound with wire at the desired tension, generally about eight tons per square inch. A pipe 2 feet 4 inches in diameter and ½ inch thick, doubly wound with ¼ inch wire under a tension of five tons per square inch, on being tested only showed signs of giving way under a pressure of 485 pounds per square inch, while it burst at 529 pounds per square inch.

THE Society for the Encouragement of National Industry, Paris, offers the following prizes, to be awarded during 1899: First prize of 3000 francs (\$600) in connection with the manufacture of permanent magnets. Research may be directed to the composition of the steel for the magnets and such materials other than iron which may enter into it, or to the degrees of temperature for the liquids used for tempering, and the processes of annealing and other necessary accessory operations which are likely to obtain this result. Second prize, 2000 francs (\$400), for an incandescent electric light which must not exceed a maximum of two candle power (decimal system). Third prize, 2000 francs (\$400), for any set of electrical appliances or tools suited to the requirements of domestic life and to small trade.

THE Westinghouse Electric & Manufacturing Company, of Pittsburgh, Pa., has established a regular training school for its apprentices. It was planned by Philip Lange, superintendent, and there is a long list of applicants waiting to enter. Apprentices are taken on a three months' probation, being paid 5 cents an hour; if satisfactory they are promoted and paid 8 cents an hour. Apprentices more than 21 years of age receive 10 cents, and serve three years, while those younger serve four years. Wages are advanced each year, and at the expiration of the term of service, each is paid \$100 additional. Engineering, draughting, mechanics and electricity are taught while the student is being paid.

Said of the "Mining and Scientific Press."

A journal that thousands esteem of sufficient value to annually pay the subscription price therefor may be safely regarded as an "A 1" medium for advertisers.—Carriage Monthly, Philadelphia.

Gold in Ancient California River Channels.

The resignation of Felix Chappellet as manager of the Mayflower mine recalls the richness of that section of California, the success he attained in locating and working that portion of the ancient river channel known as "The Mayflower," on the Forest Hill Divide, Placer Co., Cal., and, incidentally, the unique character of that form of mining and the great richness of that section.

Ross E. Browne has given an intelligent technical account of that region, a section that gives good example of a class of gold mining peculiar to California.

The extensive workings on the Forest Hill Divide have developed a good idea of the prehistoric geological formation, and besides yielding about \$30,000,000, have aided in solving some of the problems that present themselves in handling similar propositions elsewhere.

The Forest Hill Divide is a ridge on

ancient river or rivers, and that it was valley-like in places, being some miles in width and 1000 feet in depth in the deepest place. It was no small stream that found its way through this depression; the gravel deposits show a width of 1000 feet in places. How long the river flowed on without obstruction is unknown, but at some time there came a volcanic eruption followed by a flow of volcanic matter in the form of a semi-fluid, or mud, from the craters on the summit of the Sierras. The flow naturally occupied the watercourses, solidifying and sealing up the river channel as it was deposited from the flow down the trough. This flow filled up the valley or trough to a depth varying from 100 to 180 feet, as shown by the excavations in the mines opened. This volcanic matter is called cement, and in places is firm as artificial concrete. Some good samples of this cement were shown in the Placer Co. exhibit in the Golden Jubilee Mining Fair in San Francisco in February, '98.

The river channels were changed by this volcanic deposit, but still followed

ing new channels which in the ages that have elapsed have cut deeper by hundreds of feet than their predecessors, forming the deep canyons and gulches of the forks of the American river and tributaries.

There is but little doubt that the modern courses are in some places occupying the sites of the ancient channels, cutting through and down deeper into the bedrock, leaving cross-sections of the old river bed in plain sight upon the canyon sides where the new river had come into the old bed and cut it off or left it with the same effect. So the modern streams have assisted in the fragmentary condition of the ancient channels under the lava cap.

Ross E. Browne says that from the frequent displacement of the streams during the second period, there have arisen various complications in the channel systems. Although the mining developments are extensive in portions of the district, it still remains a difficult matter to separate the channel systems of the second period, and it is not always easy to distinguish between those of the first and second periods. In a general way, it may be said that the channels of the second period differ from those of the first as follows: Their beds are narrower, rims steeper, and accumulations of bedrock gravel incomparably smaller. Regarding the gravels in the deeper channel bottoms, and their immediate volcanic cappings, it may be said that the characteristic channel deposit of the first period consists of a large body of gravel of exclusively bedrock material, and a light cement capping; the characteristic channel deposits of the second period, either of a small body of bedrock gravel and a heavier cement capping, or of a large body of volcanic gravel and a heavy volcanic conglomerate and cement capping.

Where one deep channel cuts across the deposit of another, the channel which does the cutting belongs, as a rule, to the second period. The channel which has been cut may belong to either period. There occurs occasionally very large accumulations of bedrock gravel between the deposits of volcanic cement, which are evidently

described. On the contrary, the presumption is against it. Had the second period been closed by a broad, flat-topped lava mantle, completely covering the earlier divides, one should expect to find the modern channel, independent of the cement channel in its course, occasionally cutting and occasionally avoiding the same without a very definite guidance and leaving as much of the old lava-capped divide as of the cement channel to form the present ridge. Such, however, is not the case on the Forest Hill divide. The prospecting shafts and tunnels have invariably developed the existence of a trough-like depression under the volcanic cap. The ridge for twenty-six miles shows under the cap a practically continuous depression in the bedrock surface. There is good reason for regarding this as the main cement channel of the district. It is difficult to establish satisfactorily the cause which led the modern river to avoid the older cement channel to so marked an extent. In picturing the periods it has been assumed that the old river bed, or rather the valley, was filled with volcanic material to a level high up on its widespread rims, but not to actual overflowing; that the thick volcanic mud formed a more compact conglomerate of the heavier debris in the central line of flow, and a lighter and more sandy cement toward the shore lines; and that these conditions tended to divert the streams toward the marginal lines of the deposit. The streams would necessarily cut across the deposit at the juncture of the volcanic-capped tributaries.

The gravel deposits of the old river beds contain the gold, and these places are still the scenes of active mining operations. The deposits are commonly referred to as "channels," and the channels bear the name of the respective mines, although in some cases the channels contain the deposits of one and the same water course and are the same ancient river bed.

The gold in the gravel originally came from the quartz ledges in the bedrock, traversed by the old rivers and tributaries. Throughout the entire bedrock occur seams and ledges of

the western slope of the Sierras, twenty-seven miles long. Along its north side flows the north fork of the American river, the middle fork flows in the canyon forming the boundary of the south side of the Divide. It is thought that the present bed of the north fork is 3000 feet lower and the middle fork 2500 feet lower than when these streams first started to flow down through their present courses.

In the course of years extensive mining carried on in the gravel deposits of the Divide goes to show that what now

the same general direction to the basin of what is now the Sacramento, as the watercourses were still confined by the rim or walls of the trough or valley.

It is reasoned from the large quantity of gravel and sand deposited over the volcanic cement that a great period of time passed before the next great lava flow capping the channels of the second period occurred, but it is evident that several minor flows happened in the interim which diverted the watercourses and mixed with the river deposits masses of volcanic matter. The

is a ridge was just the reverse in the topography of the country before the period of volcanic eruptions covering the country with a cap of lava. The ridge contained the channel of a river bed; it was the trough of Nature's drainage system of that section for that period, and where the present river beds are the country was higher than the ancient channel bed. The formation underlying all the surface deposits, the base or bedrock of the country, is metamorphic rock which vary in character. Active mining has been carried on there for forty-five years and by the hydraulicking of banks from 50 to 200 feet high, and by the driving of miles of tunnels and the excavation of tens of thousands of yards of gravel, miles of the bedrock thus exposed give insight into the changes that have taken place on the surface of the bedrock during part of the present geological epoch.

It seems that the trough above described was the watercourse of an

frequent displacements of the streams is shown by the fragments of channels found on this level. The rivers of this age at times and places cut down through the cement cap of the first period to the bedrock, obliterating the deposits and evidences of the original channel by following its course for a distance or cutting directly across it in other places. The deposits here described are known as the upper lead.

Following the second period came the volcanic eruptions with great flow of masses of lava or cement, which filled the trough or valley, making a cap over the bedrock at the upper portion of the Divide 1000 feet deep and 300 feet at the lower end.

Then followed the final work of Nature in creating the topography of the Forest Hill Divide. The trough was filled higher than the bordering country and the streams started new courses along the edges of the cap, along the line of least resistance, erod-

ing new channels which in the ages that have elapsed have cut deeper by hundreds of feet than their predecessors, forming the deep canyons and gulches of the forks of the American river and tributaries.

The section given in the cut of "Weske channel, longitudinal section," shows an interesting occurrence. The cement filling the bed to a depth of 100 feet is a more uniformly fine-grained sediment than is commonly encountered. It encloses a number of oak and cedar trees standing on the banks of the channel, with the roots intact in the gravelly soil and bedrock. One of these is a cedar nearly 100 feet in height and 4 feet in diameter at the base and stands perfectly upright, and, considering its age, is in a surprising state of preservation. These standing trees show also that the first flow of the cement was not torrential, though moving with a certain velocity. The existence of a current and its direction are plainly indicated by the structure of the deposit immediately surrounding the trunks of the trees. In certain districts in the State the ancient channel system, together with its dividing ridges, was completely covered by a broad lava-cap or mantle prior to the starting of the modern channel system.

There appears no definite indication of such a mantle in the district herein

gold-bearing quartz; and where belts of soft laminated slates appear, there is found a greater quantity of the gold-yielding silicates. All of the gold found is in the form of nuggets or scale and shows the effect of abrasion or hard usage in contact with the gravel in its journey down the rapid streams to the place of its final resting. In uncovering the bedrock in removing the gravel deposits, some very large ledges have been found, but none so far as known have proven very rich.

It is assumed that the ledges were richer nearer the original surface and that in ages past they have been worked down perhaps for several hundred feet by the erosive action of the elements.

As a rule, the richest pay is found in with the bedrock, although in some of the mines pay is found in the gravel for the entire depth of the deposit. Scales of gold become embedded in the seams of bedrock, and especially where occurs the softer laminated slates it generally pays to remove the surface of the bedrock for several inches.

It is a common idea that the gold will be found in greatest quantities in the deepest holes or depressions of the river beds, but the experience of the

miners in these ancient channels is to the contrary. The richest dirt is found in the channel on the brow of the lower side of a hole or depression. Mr. Ross Browne, who has given this matter study, says that the effect of the swiftness of the current upon the pay is important. An underloaded current, i. e., a current charged with less detritus than it is well able to carry, is apt to cut its bed and prevent the accumulation of gravel. A greatly overloaded current will deposit

too rapidly to admit of the concentration of gold dust. It is apparent, therefore, that a suitable relation between the velocity of the current and the amount of material carried is an important factor in forming a streak of pay gravel. If such a relation exists, and is undisturbed for a considerable period of time, and the material passing over the riffled bed carries sufficient gold, a rich body of pay gravel may be formed. An increase of grade, or narrowing of the channel, will cause an increase of velocity, and the same stream may be underloaded in a narrow, steep section and overloaded in a broad, flat section. Furthermore, a stream may be underloaded in the center of the channel and overloaded on the rims, or it may be underloaded on the outer rim of a curve and overloaded on the inner rim. Other conditions being the same, when the average grade of the channel is very great, one should expect to find the pay in the broad, flat sections, on the rims and high up on the inner rim of the bend;

deep lead, or the channel system of the first period. His discovery gave new life to the mining industry there, proving that, instead of the mines having been exhausted, many of them would yet supply the world with millions of dollars of gold and hundreds of men with years of employment.

It was first attempted to mine the deep channels by shafts through the volcanic cap, but large quantities of water were encountered in every case, and the cost of pumping entailed such heavy expense that this method was abandoned, and long, deep drain tunnels are driven in through the bedrock to points underneath the trough or channel bottoms, upraises at intervals, and the gravel breasted out is dumped through these openings into cars holding about one ton each. The loaded cars are taken out of the mines in trains of a dozen to twenty-five cars, hauled by

a mule to the mills, if the gravel is of the kind to be crushed, or to the sluice boxes, if the free or loose kind that only needed washing. Some of these drain tunnels are very long and cost thousands of dollars and many months of tedious work before the pay was reached. The cost of running such a tunnel used to be about \$25 per linear foot, and when mine owners were compelled to run a mile of this kind of work they had to expend a fortune in dead work. The work can be done now at very much less expense. That these tunnels should be successful it was necessary that they should be below the grade of the channel bottom, and to thus properly locate the tunnel the best of judgment and engineering talent was required. Especially is this true of the first few tunnels located. The depth of the volcanic caps could be easily ascertained by sinking a shaft through it to the bedrock, and by drifting thence the locality of the channel could also be definitely established; but to find its grade or fall was a more difficult mat-

by means of his shaft, he must allow for a fall or pitch about 18 or 20 feet in that distance. When contemplating the anxiety of the mine owner who first staked an investment of \$150,000 and months of hard work on the correctness of this theory, one can imagine the exultation and gratification experienced when the completion of the work demonstrated the correctness of the calculation.

Twice in this article the fact has been referred to that Mr. F. Chappellet had done much to clear up uncertainty and aid in practicable and profitable getting of gold from those ancient river channels, or as it is called in California, "drift mining." How this was done will next be taken up.

What is called the "Paragon channel" was discovered at a point on the north side of Volcano canyon, in 1853, and after some of the embankment was cut away by hydraulicking in later years a complete cross-section of the main channel of the first period was then exposed. The channel from this point bears a northerly course for a

territory. There are about two miles of the deep channel within the claim, the larger part of which has been mined out. The company still has a large amount of gravel to handle in the upper leads and also several hundred acres of rich ground to work by the hydraulicking process.

The mine was first known as "a hydraulic proposition," and was worked by that system until the Debris decision compelled the owners to shut down. It was then that Mr. Chappellet decided to sink down through the cement forming the bottom of his hydraulic pit in search of the channel which he felt certain was there. The hard cement had been generally accepted as the bedrock by many miners, and there were few to agree with his theory. He had reasoned out that the slate was the formation of the earlier geological period, and, therefore, the real bedrock of the country; and that the rims of this rock, exposed on the sides of the ridge, pitched to the center, plainly showing a trough or depression, and that the cement was clearly a formation of comparatively recent age,

mile, then turns sharply to the west southerly, making almost a complete horseshoe. The gravel is cemented together, it is assumed, by the percolation of silicious waters. It is of blue and gray color. About 25 per cent of the gravel is large boulders, which are left in the mine, filling up spaces breasted out. The average width of the pay gravel extracted is 50 feet. The entire length of the channel within the limits of the claim has been worked for a distance of about 7000 feet, and connection is made with the workings of the adjoining claim, the Mayflower, into the territory of which latter company the channel continues, though it is there known as the Mayflower channel; thence into the ground of the Excelsior, Dardenelles and some minor claims, and there known by the titles of those mines, although it is one and the same ancient river bed. The gravel from the channel was so strongly cemented that it had to be put through a stamp mill, and had to be drilled and blasted out of the mine.

The Mayflower mine, which has the continuation of the deep channel as above described, was opened by Mr. Chappellet as part owner and superintendent. In the character of the gravel of the two channels, the method

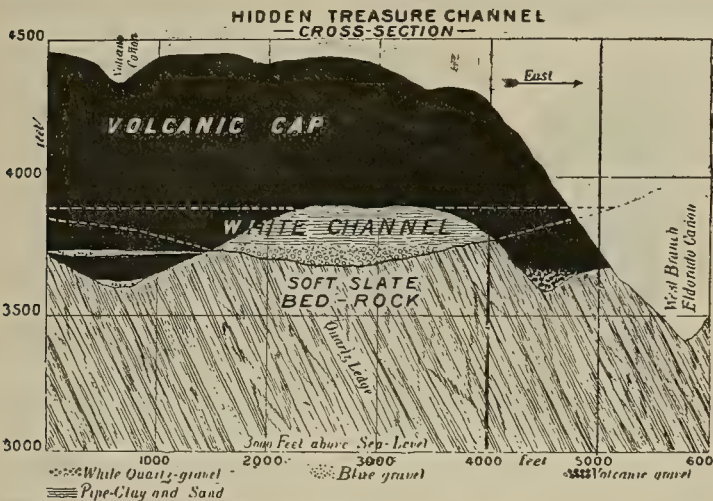

and, consequently, there must be a channel underlying it.

Firm in this opinion and regardless of any adverse comment, he commenced sinking his shaft, and, after going down 200 feet, struck the slate or bedrock, but had not penetrated the cement. Finding the bedrock pitching sharply to what he thought was the center of the ridge, he concluded he had not reached the bottom, so started a drift east; and, after running 100 feet, struck down a winze 22 feet to bedrock, which he still found pitching to the center of the ridge. He ran another drift 50 feet and sank another winze 90 feet and 100 feet in and 14 feet down, thus feeling his way until success crowned his efforts and the Mayflower channel was discovered. It was a great triumph for Mr. Chappellet.

The gravel proved to be rich. A mill was erected near the mouth of the shaft and it was attempted to work the mine through the shaft, but the flow of water was too strong to be successfully handled. The man who had found the channel was not to be balked, for then it was he conceived the idea of running a tunnel from a point some two miles down the canyon, so as to tap the channel and drain it. He also planned to work the mine through the tunnel, thus avoiding the expense of hoisting works.

From the entrance of the tunnel to the point where the channel was reached by the best location that could be made the distance was 5585 feet—over one mile—driven through hard slate for the entire distance. The cost of the tunnel was about \$150,000. It took one year and a half to complete it.

The completion of the tunnel and the tapping of the channel were another great victory for the superintendent, for he had now twice demonstrated the correctness of his theory, as well as the existence of the ancient channel with its valuable gold deposits.

when the average grade is very small, rich gravel will be more likely to occur in the sections where the current is relatively swift. In the Forest Hill district, where the average grades range from 60 to 80 feet to the mile, the general experience in working the bottom leads seems to be about as follows:

In the larger channels of the first period the best pay is found on the brow of the steeper pitches on the down-stream course and on the inner rims of the bed. The pay generally favors one rim for long stretches. Near and at the foot of steep pitches, and in very narrow sections, there occur potholes and the deposit is barren, consisting of round boulders and sand. In the channels of the second period there is a scarcity of gravel in the narrower sections, hence the broad, flat sections are preferred, even though the gravel may not be so rich.

Felix Chappellet of the Mayflower is believed to have been the first to make the first complete development of the

ter. At that time it was not definitely known whether the pitch was east or west. The grade of the caps and the grade of the rims, however, indicated to the observing miner that the bottom

of the trough had a corresponding pitch to the west, and that if he wanted to have his tunnel reach a point under the bottom of the channel, say, 1000 feet west of where he had found the bottom

of mining and milling and the yield of gold, the Mayflower does not materially differ from the Paragon, except that the mine was operated on a larger scale and the company owned more

Mining Summary.

CALIFORNIA.

Amador.

Republican: The mines of this county that depend upon water for power are being supplied regularly, and the prospects are fair for a continuation of the supply.—The Good Hope mill is crushing rock for Sullivan & Co. The ore comes from a claim near the Monte-richard mine, near Jackson.—The Zella is closed down for repairs and sinking.—Adams & Folger will develop the Fleming claim near the Zella.—The mill at the Kennedy mine has been put in order and work at the mine continues with a full force.—The Amelia is down about 675 feet.—At the Argonaut mine work is going on satisfactorily.—Hard rock has been blocking rapid sinking at the Anita mine for some weeks.—A good quality of rock is coming out of the Oneida mine and hauled to the Zella mill.

Ledger: The Emerson shaft at the Wildman-Mahoney mine is being pushed. The property is to be equipped with a compressor and power drills.—The south shaft at the Kennedy mine is being operated by steam, but will soon change to water power.—At the Amador Queen No. 1 the shaft is being repaired.—At the Bailoi mine, Sutter Creek, Supt. Porter is crosscutting at the 200 level in the new shaft.

Butte.

The Best mine, near Magalia, is running regularly.—The John Dix mine is running steadily and twenty men are employed.

The Feather River Exploration Co., operating near Oroville, owns a large tract of land on the west bank of the Feather. The dredger built last winter is working steadily and the company talks of building two more in the near future. The machine was floated in the river, and after working out a bar, has now attacked the mainland, the intention being to cut into the land, leaving a channel for the water to follow. On fourteen acres adjoining this company's land Corwin & Daniel-witz are working by bucket and cable. Mr. Cartwright, who owns thirty-five acres of land, also on the west bank of the river, is in communication with San Francisco with a view to having a dredger built to work his land. Adjacent to Oroville the Con. G. M. of California, Ltd., owns 120 acres of land and intends to build a dredger. Considerable prospecting has been done on this property. Ditzler & Faris are washing considerable dirt, their aim being to erect a dredger in case they find it will pay.

At Nimshaw the Ethel mine has temporarily closed down.—At the Boulder a crew is working, and on the Matheson claim a full force continues.—The Butte Queen near Chapparral continues work.

Feather river near Oroville is so low that parts of its bed are dry and a number of Chinamen are at work with rockers cleaning out crevices and washing the gravel deposited therein.

Calaveras.

(Special Correspondence).—The San Justo mine, at Carson Hill, is an illustration of successful work by good management in working low grade ores. This property was owned by Remington and associates of New York, who expended \$340,000 upon it, built a 40-stamp mill, chlorination works, fifteen-drill compressor and five houses. They operated two years, but the management was too high-grade for the low-grade ore. The mine was shut down and the shaft filled with water. Last December Dr. Flint, C. A. Hamilton and Senator Flint bought the property, unwatered it, and retimbered the shaft to the 700 level. They have milled ore from the 200 and 300 levels, and are opening a level at 600 and 700 feet. The ore mills from \$3.50 to \$4 a ton. The sulphurets run 5 per cent on the 600 level and yield about \$80 a ton. On the 700 level a mill run on 100 tons yielded \$14 a ton. The ore bodies are from 30 to 80 feet wide. The stamps used weigh 850 pounds. The water power plant is the property of the company. The ore is mined and milled for \$1.30 per ton. The company has installed a system of thorough discipline and business economy, and they hope, by careful management and practical knowledge of treating low grade ores, to make this a profitable property.

Angels, July 25th, '98.

The Violet mine at Licking Fork is being worked by Goodman, Barnhart and Balsley, and showing good prospects. They have a pay chute which averages 2½ feet in width, which yields about \$60 to the ton in free gold, and have a 3-stamp mill nearly completed for reducing the rock.—The shaft of the Machavella mine at North Branch has been unwatered and a ledge 12 feet in width has been found.

After four years of quietness the first work towards reopening the Sheep Ranch mine, at Sheep Ranch, commenced on the 7th inst., W. H. Clary Jr. Supt. There will be employment for a small force, only for some time. New hoisting works and mill will be built, it will be eight months before water can be pumped out of the mine and the shaft retimbered. The company intends to build an electric plant on the San Antonio creek near town to run the mill, pumps and air compressors.

Del Norte.

J. P. Crawford & Co. are extensively working gold-bearing sands in Smith River valley, near Crescent.

El Dorado.

(Special Correspondence).—Near El Dorado Clark & Richards have begun work on the Hill Ranch, adjoining the Pocahontas mine, and are taking out a good class of ore.

Hayward & Poundstone have secured a lease on the Bonaset mine in Jayhawk district. There has been considerable development work done on this property. It is said

that the new company will begin operations without delay.

The Pine Hill G. & S. M. Co. near Rescue, who have done a great deal of underground work and ceased, pending some domestic adjustments, are about to resume work. The property belongs to South San Francisco capitalists.

The West Side mine at Grizzly Flat has an 800-foot tunnel at 250 feet depth. The company has 200 tons of ore cut out, upon which their 10-stamp mill will start in a week.

Placerville, July 25th, '98.

The Lucky Marion mine near Greenwood is being unwatered and development work will be crowded.

The Sutherland gravel mine at Grizzly Flat will not close down, as has been reported. At a recent visit of W. H. Sutherland and D. H. Jackson to the property it was determined to continue work.

Kern.

The shaft of the engine at the Little Butte mine broke recently and the mine has been closed down until a new one can be put in place. It is expected that work will be resumed about the 10th of August. This is the second time this year that the same accident has happened. The ledge in the drift at the 480-foot level is 4 feet wide. The Johannesburg reduction works cleaned up after a forty-ton run of Butte ore, running about \$75 per ton; at the present time the stamps are dropping on a fifty-ton lot from the same mine.

A decision has been rendered in the case of the Windy claim in favor of L. A. Scott and against the Ashford Bros. who in the spring of '96 located the Rocket and did some work. At about the same time L. A. Scott located the same ground under the name of the Windy claim. One morning when the Ashford brothers went to work they found Scott in possession and ready to back up his claim with a shotgun. The case was taken to the courts with the results noted above. While Scott was in possession he sunk about 40 feet and took out in the neighborhood of \$1500, \$1200 of which is held by injunction in a bank awaiting the result of the trials. In the fall permission was given by the judge for both parties to do their assessment work.—The Yellow Aster is shipping fifty tons of ore a day to the Barstow mill.

The Los Angeles Review says that the Long Tom mine, near Bakersfield, has been sold to Pittsburgh capitalists for \$160,000, of which \$10,000 was cash. There are about 7000 tons of tailings on the dump, estimated to be worth from \$7 to \$8 a ton, and which the new owners propose to cyanide.—J. W. Waltham has taken a bond on the Golden Bar mine at Johannesburg and prospecting has begun.

Lassen.

(Special Correspondence).—The Hayden Hill Con. M. Co.'s tunnel in Hayden Hill district is in about 2000 feet.

The Hayseed has encountered good ore in the drift on the 280 level and the mill will soon be started. The indications point to a widening of the ore body with depth.

The Independent is becoming one of the reliable bullion producers of the camp. A one-third interest in the mine was recently sold to Dr. A. G. Schlosser of the Golden Eagle Co. The new cyanide plant for the treatment of Golden Eagle ore will soon be in running order. The MacArthur-Forrest process is used and the plant has a capacity of forty tons per day. Supt. Stone estimates that there is ore enough in sight to keep the plant busy two years.

Adin, July 25th, '98.

Los Angeles.

The San Gabriel M. Co. near Azusa is running a tunnel under the bed of the creek to drain the gravel above to bedrock. The tunnel is in 1500 feet.

The new mill at the Puritan mine at Acton is complete and in running order.—Upon the return of U. S. Senator White from Washington operations will be resumed at the Red Rover mine.

Nevada.

A new 20-stamp mill for the Delhi mine on the Middle Yuba river above Columbia Hill is being built.

The new hoisting works at the long abandoned Le Compton mine near Nevada City are nearly finished and development work will soon begin. The property was at one time a good producer.

Placer.

The June statement of the Pioneer G. M. Co. reports as follows:

| | |
|----------------------|---------|
| Value gold bars..... | \$6,665 |
| Total expenses..... | 4,918 |

| | |
|-----------------------------|---------|
| Net income..... | \$1,747 |
| Tons of rock crushed..... | 505 |
| Number of men employed..... | 44 |

The June statement of the Pioneer G. M. Co. compares as follows with previous months:

| | Tons rock crushed. | Value gold bars. | Total expenses. | Net income. | Value ton per ton. |
|----------------|--------------------|------------------|-----------------|-------------|--------------------|
| 1897. | | | | | |
| July..... | 650 | 14,156 | \$5,109 | \$9,055 | \$21.77 |

| 6 mos. '98. | 4,906 | \$66,698 | \$34,319 | \$32,379 | \$13.60 |
|-------------|-------|----------|----------|----------|---------|

Accompanying the Pioneer statement the directors make the following announcement: "The small amount of rock crushed in June is owing entirely to the diminishing water supply. The work on the dam and flume is being rapidly pushed, and plans for the electric plant, recently contracted for, are being pre-

pared. The directors expect it will be in place by the time the dam is finished."

Near Forest Hill prospecting is being done at the Mayflower and a small crew is at work at the Breece & Wheeler claim at Bath. A. F. Westfield has struck pay gravel at his claim on Shirt Tail canyon.—At the Eureka, F. Chappellet, Jr., Supt., the tunnel is in 3000 feet, where an upraise has been driven 200 feet. The upraise is in a soft formation. Twelve men are employed.—At the Hidden Treasure mine near Centerville 235 men are employed. Men are working on tribute in the old tunnel at Sunny South and are said to be making good wages.—Mining on the river near Michigan Bluff is active. Supt. Roumage has a large force at work at Horse-shoe Bar and from present indications he will have a very profitable season's run.—Owing to the scarcity of water W. S. Davis will not be able to work his mine at Mammoth Bar this season. G. F. Huber and L. L. Chamberlin are working a small crew at the Gold Slide on the American river.

Plumas.

P. Hansen, in his claim near Meadow valley, found a nugget that weighed \$120.—Near Butt valley A. Cameron is taking out pay gravel.—J. Rickard is developing a quartz proposition at Horsehoe Point and expects soon to erect a mill.—White & Bennett are constructing a wing dam to work a river-bed claim.—The Dunn Bros. continue to operate their 2-stamp mill on ore from their ledge. It is reported good.—Austin and Cadie continue mining in the Pliocene, from which for many months considerable gold has been taken.—Hickerson and Davis are getting a good prospect in gravel below the Pliocene mine.—The Savercool Bros., including themselves, have several men employed at Dutch Hill and it is understood that they are doing well.—H. Kelly is running a second tunnel in the San Jose drift mine.

At the King Solomon mine near Taylorsville work is progressing favorably. The wet ground has been passed and each of the three shifts succeed putting in a set of timbers. A 5000-foot tunnel is expected to cut the ledge at 2000 feet depth. There remain 400 feet of tunnel to be run.

San Bernardino.

Ingersoll & Esler at Virginia Dale are putting up a stamp mill, which will soon be ready to crush ore from their property.

A mortgage for \$25,000, given by the Randsburg Santa Fe Reduction Company to the Union Trust Company of Rochester, N. Y., was filed for record with the recorder of the county last week. Sec. 1, T. 9 N., R. 2 W., with all improvements, was given for security to float bonds for \$25,000.

J. M. Wolbrecht, Gen. Mgr. Golden Slope mine near Victor, has specimens of honey-combed quartz threaded with gold, taken from a ledge 4½ feet wide. There is a 5-stamp mill at the mine.

San Diego.

F. Ganahl has started up the Cincinnati Belle mine near Julian.

Shasta.

(Special Correspondence).—In the Muletown district and about Whiskeytown development work is in progress to a greater extent than has been the case in the history of the county, and, too, with notable success.

The amount of ore being hauled from Shasta and surrounding country to the smelter is reaching into large proportions. Men who a few years ago had their holdings mortgaged and were about to lose their little ranches have turned to quartz farming, with good results. On every road leading from the several mountain villages to the smelter one meets teams drawing ore to Keswick, for which they get not less than \$2 per ton, and oftentimes a much better price.

The ores about Shasta and Whiskeytown are mostly free milling, though among these are found properties that from careful study show that chlorinating and cyaniding must enter largely into the successful treatment of ores in this county. The reopening of the Butters cyanide works at Kennet will do much to advance the mining industry of this section and bring about a demonstration that Shasta's possibilities in the mining field will at last be brought into life and become productive.

Redding, July 26th, '98.

The Desmonds at Whiskeytown are taking out ore and will start up as soon as the rains come.—Brown & Son are at work on the Pompeii and meet with encouragement as they go down on their porphyry dyke.—Men who have made a thorough examination of the Davis copper mine report some of the ore bearing 40 per cent copper and from four to twenty ounces in silver and \$2 to \$30 in gold. Davis is negotiating with the Mountain Copper Co. to deliver his ore at Keswick in ten-ton lots.

Sierra.

English & Smith have bonded the William Tell mine near Sierra City for G. A. Price of Denver, Colo., who will build a 10-stamp mill upon it. There are two ledges—one 4 feet thick of fair grade ore and one from 10 to 20 feet of low grade.—Work at the Gold Bluff mine near Downville is progressing. The air compressor and receiver are set and the pipe nearly into the shaft. The pump will be started soon.

Siskiyou.

On the 18th inst. the sheriff put James McCaw of Oakland into possession of the Macauley & Fry quartz mines on Patterson creek, as a result of the decree in favor of the plaintiff McCaw in the case of James McCaw vs. Thomas Macauley and C. J. Fry. This cause has awakened a great deal of interest among miners and mining men. By the decree the Court obliges Macauley and Fry to specifically carry out the terms of a contract they entered into with the plaintiff some time in January or February of this year. The terms of the contract called upon McCaw to

pay \$35,000 for the mines, \$2500 of which was to be paid in April and the balance in two equal payments, one six months and the other a year later. McCaw tendered the \$2500 as per contract, which Macauley and Fry refused to receive, claiming the contract was void.

The main question decided by the Court in the action was as to the validity of the contract and the right of plaintiff to compel defendants to carry it out on their part, after plaintiff had tendered performance, the Court holding that plaintiff was entitled to force performance.

The judgment of the Court, says the Yreka Journal, meets with the general approval of all people interested in mines and mining sales. The prospector who finds a promising property is able by letting the intending purchaser into possession, upon a small sum paid down, to realize the value of what the future of the mine may develop, while on the other hand the purchaser is able and willing to take hold of such a property and develop it, if it proves what both think it will, to pay when such fact becomes apparent, a fair sum for the mine. It is really the only method by which the prospector can ever realize a good round sum for his prospect; and if such contracts cannot be enforced, then capital will not be employed to develop our prospects, as they would not dare depend upon the moral consideration which might weigh with the seller. If it is law that the seller can back out when he desires, most if not all undeveloped mines are sold on future contingent payments. If sales can only be made for cash down the prospector fully realizes that he can never receive pay for anything more than is in sight, as all fully realize the old saying, "You can't see an inch ahead of the pick." Consequently it is in the interest of the miner and those who have undeveloped mines that the legality of such contracts be upheld, as great inducement both to the mine owner and to capital.

Journal: The river miners on the Klamath have been troubled about getting heavy enough current under their wheels, and have been obliged to bank the stream or confine it in narrower limits where possible, on account of low water. All are hoisting pay gravel, and taking out considerable gold, with prospect of having the best paying season yet known. The low stage of water is advantageous from Oak Bar to Happy Camp. Above Oak Bar, when the river is very low, the wheels have to be dropped down to the lowest gauge, and the current of the river forced under them by means of breakwaters and bulkheads to turn the stream where needed.

Tuttle & Davis have a paying mine on Scott river, from which they realized \$3000 lately.—Morrison & Coburn have put in an engine and boiler to run their quartz mill.—The King Solomon quartz mine at Salmon river has been showing well lately, but water is scarce to run the mill, the water being pumped for use a second time.—The Greenhorn Blue Gravel mine near Yreka continues to yield well and more drifters have been put to work. The water is gradually diminishing, but by extra efforts in securing all the bed-rock drainage, and using it a second time by pumping back, enough is secured to keep the sluices supplied.—The Fry & Macauley quartz ledge on Patterson creek, bonded by J. McCaw, is being prospected by the latter with success.

News: The Shurtliff mill crushed thirty tons of ore from the Spencer dump. The Shurtliff mine is also a producer.—J. H. Smith is opening up the Knownothing mine, near the Forks of Salmon.—The Reader & Co. mine at Fools Paradise continues to yield high grade ore. They are developing the mine systematically and take out enough quartz to keep the mill running.

Trinity.

(Special Correspondence).—Authentic reports have reached here of a new strike in the Brown Bear mine at Deadwood. In driving a lower tunnel a ledge was found that is said to excel anything produced in the palmy days of this mine. The product of the Brown Bear was for several years almost abnormally rich, and little or no attention was paid to the lower grade ores. In latter years, however, when it was supposed the rich ore body had become exhausted, the company was content to work the lower values, and also sublet its work to tributaries and do custom milling. It is known that in the second stage of its history, having been taken up by the present company as an abandoned property and bought for a bagatelle, it made occasional monthly clean-ups from a 10-stamp mill that ran from \$28,000 to \$37,000 on the plates.

At New River, on Canyon creek, the Chloride & Bailey is producing good ore. The thorough and extensive development it is receiving from the new company will determine its worth. The property was recently secured by San Francisco and New York capitalists, who are opening the property, not on an extravagant surface plant, but upon a practical and broad gauge system of underground work.

Lewiston, July 25th, '98.

Tuolumne.

A. E. Davis of San Francisco has bonded the Mount Hood and Sunrise mines at Jamestown and will develop the property.

Democrat: The App mine, at Quartz Mountain, owned by Nevills, Ballard & Martin, is down over 1000 feet. Two thousand tons of ore per month are put through the 20-stamp mill.—The quartz mills of Tuolumne have 405 stamps dropping.—The crosscut tunnel on La Estrella is in 315 feet.—A good strike is reported in the Gray Eagle at American Camp.—The Golden Gate is down 700 feet, with several thousand feet of drifts. It has been operated for years.—Work on the Pennsylvania and Rhode Island, the Goldwin M. Co.'s two mines on the East belt, is being pushed. All the workings are reported looking well.—Owing to the lack of water, the Star is still closed.—The Eagle-Shawmut, Jacksonville, owned by Halsey, Rosenfield & Co., is extensively operated. It has a big pay-roll and a 20-stamp mill.—The Hope, a Bald

Mountain property, owned by S. Ralston, has a large vein and is producing good ore.—The Bonanza contemplates building a stamp mill. D. Oliver of Sonora is one of the owners.—The New Year mine has been bonded for \$50,000.—The 20-stamp mill on the Confidence is in constant operation.—The Kanaka, at Groveland, is said to be producing high grade ore.—In the Rappahannock work is progressing.—All the new machinery for the Mt. Jefferson in Groveland district is being placed and extensive underground operation going on.—The North Star and Black Warrior, at Moccasin creek, are extracting ore from an 18-foot pay-streak.—The old Soulsby, which sustained a whole town for years and produced \$5,500,000, is idle, despite the fact that those in position to know say there is still plenty of ore.—Water is being kept out of the Seminole group with a view to an early resumption of work.—A large body of ore was recently discovered in the Dreisam, at Arastroville.—The recently opened up Denmore, near Parrott's Ferry, is making a good showing.—The Sell mine is running steadily with good results.—The Tanzy pocket mine, near Sonora, is yielding a good product.

Yuba.

(Special Correspondence).—The soundings made in the Yuba river, under the supervision of a civil engineer in the employ of the U. S. Debris Commission, have been thoroughly prosecuted. The depth reached through the tailings to bedrock, as nearly as can be learned from unofficial, though reliable, sources, is 70 feet. Three different localities were examined. The report upon the work is now, no doubt, in the hands of the U. S. Debris Commission, who will determine which site shall be selected. The Narrows in which these soundings were made are about 1½ miles from Smartsville and are about 300 feet deep. Smartsville, July 27th, '98.

Marysville Democrat: Amador county men are trying to get the mine and mill of the Good Title Co. of Indiana Ranch, to resume sinking and further prospecting the property. This will be settled as soon as Mgr. Carson returns from Cincinnati, Ohio.

NEVADA.

The new camp of Searchlight is twelve miles from the Colorado river near Summit Springs, Lincoln county. The boundaries are: From the northern point of the Vanderbilt district in California where it touches the California-Nevada line, due east to the Colorado river, thence down the Colorado river to a point due east of Newberry Peak, thence due west through Newberry Peak to the California-Nevada line, thence along the California-Nevada line to starting point. G. F. Colton is district recorder.

McDermott Bros. of Los Angeles, Cal., and Butte, Mont., have bonded Murphy & Co., in Bull Run district, Elko county, five claims for \$150,000. There is some development work done on the property. The ore averages \$20 a ton and can be mined and milled, it is said, for \$1 a ton. The prospect tunnels, on ore, are 1200 feet above the creek in a mountain that rises to a height of 3000 feet with a 30° pitch. Under the provisions of the bond, men must be put at work immediately. Before a year a mill or reduction works, with a capacity of forty tons daily, must be under construction, to be completed by November 1st, '99.

A chalk deposit two miles long and 400 feet wide has been found near Lovelock.

The Union Con. M. Co., Virginia, has re-elected the old board of directors, with C. H. Fish, Pres.; A. P. Swain, Sec.; D. B. Lyman, Supt.

Last week thirty-five miners were laid off by the Supt. of the Nevada mines in lone, and several others quit. The draft was from the group of mines in Shamrock Canyon, the Cleveland being closed down. On the 15th over half the miners employed in Austin and a number of the top men were laid off. J. C. Fleming has been appointed Supt. of the Nevada Co.'s mill and mine at lone. The Eureka Sentinel hears that the present ceasing of work in Austin is due to the embezzlement of about \$300,000 of the Austin M. Co.'s funds.

The bullion yield from the Olinghouse Canyon, Washoe county, was \$2500 in the past thirty days.

The Eureka mine at Como is being opened on the 115-foot level. A recent test crushing of seven and one-half tons netted \$83. If the next mill test proves equally good, extensive development of the mine will follow.

Winnemucca Silver State: Deep mining, as contemplated by the managers of the various Comstock companies, means a revival of our wood, timber, farming and railroad industries. Every taxpayer in the State should be in favor of any reasonable project that would enable the resumption of work. The feasibility of opening the lower levels is acknowledged by competent engineers.

OREGON.

The Rogue River Courier says the Wimer Bros., operating a placer mine near Grants Pass, made a cleanup after an eight months' run and that it amounted to about fifty pounds in gold.—The Gold Bug group, comprising six claims on Mt. Reuben, upon which J. P. Jones and others have been exploiting for a year, has been bought by them, and the property will be further developed and equipped with machinery. The ore varies from five inches to 15 feet and much of it mills \$50 a ton.

At Baker City suit has begun in the Circuit Court by F. M. Bolles asking for an injunction prohibiting the new owners of the Virtue—Messrs. Labaree and Thompson—from operating the mine or in any way interfering with his rights.

BRITISH COLUMBIA.

The Giant mine at Trail made its first shipment to the Trail smelter. It sent down twenty tons and will make regular shipments.

The directors of the Le Roi Co. at Rossland

have concluded to reduce the daily ore shipments from 300 to 100 tons and to devote more force to development work.

At Rossland \$110,000 was disbursed last week to the shareholders of the old Josie G. M. Co., being part of the proceeds of the sale of the company's property to the B. A. Co. for \$265,500, and the division was on the basis of 30.57 cents per share. There were over 300,000 shares of Josie stock held in Rossland.

The Bosun group of mines near New Denver has been sold to the Sandiford corporation for \$7500 cash.

The Nelson Tribune says that in the Enterprise group, on Ten-mile, from the top showings to the tunnel on the Iron Horse, there is a vertical depth of ore of 1130 feet, with a width in No. 2 tunnel of 800 feet. In some places the ore is 2½ feet in width and of uniform richness. There is at present \$2,000,000 worth of ore blocked out. Eleven hundred tons of ore at the lake is being shipped in bulk that will realize \$200,000.

There are thirty men employed at the Porto Rico mine. A 10-stamp mill will be built. The number of men employed after the mill is erected, will be sixty or seventy-five. Work on the 2500-foot aerial tramway has begun.

Rossland Miner: The ore output for the first six months of '98 for the Trail Creek division was 39,365 tons, valued at \$1,277,079.11.

THE KLONDIKE.

Officers of the C. P. Ry. Co.'s steamer Tartar at Vancouver from Klondike outposts laugh at the statement that the Tartar had on board \$1,000,000 in gold. Far from having any gold on board the purser of the Tartar had not even heard of gold having come up the Yukon river from Dawson on the steamers Goddard and Ora.

G. A. Kinsley and W. L. McDonald of Stockton are two California miners back from the Copper river mining district. They left San Francisco last November in a party of seven. A company was formed and each took stock. When they left they were assured by a man who said that he had been in the country that he would put them on good paying ground. They landed at Orca Dec. 11. From then until a month ago they had not been anywhere near paying ground, and there is not the slightest probability of anyone ever getting on ground that pays or even ground that gives any color. For over forty miles the alleged trail is lined with provisions, left there by disappointed miners who have left and expect never to go back there again. If the mass of people in there do not get out soon the steamer lines or the Government will have to bring them out. There has not been enough gold taken out of that infernal country to fill a small cavity in a tooth. They are both miners and have spent many years in the mines and know what they are talking about when they say that the Copper river district is not a mining country. They traveled around and prospected wherever there was the slightest probability, but always with the same old chestnut, "no color." The hardships cannot be imagined by anyone who has not ventured on such a trip. At present the glacier is very dangerous to travel over, and it is unlikely that there will be many more prospective miners get from the interior to the coast until it gets colder.

IDAHO.

The Mammoth G. Q. mine near Idaho City has resumed work. The mine was for two years under development by an English company, which became involved and allowed it to be sold under liens; the time for redemption has expired. The property is owned by Poncia & Co.

At Burke a 4-foot ledge has been found in the Hecla mine, of good value.

A valuable strike has been made in the Daisy mine at Neal. From the 200-foot level a drift has encountered a ledge 6 to 8 feet in thickness that averages \$50 to the ton.

At Burke the shaft of the Con. Tiger & Poorman M. Co. is 1400 feet deep and sinking is continued. The hoisting machinery in use has a capacity of 2500 feet, and there has never been anything in the conditions discovered in the mine to raise any doubt that it will be used as long as it can be, and then larger and better machinery put in its place. When lead was lower and the ore not as good as now Supt. Culbertson estimated that under the conditions then existing the mine could be worked to a depth of 3000 feet, and it now looks probable that it will be sunk even deeper than that. It is not a question of raising the ore, there being practically no limit to the depth from which it would pay to raise that, but the amount of water increases with the depth and the cost of pumping increases. That may be partially overcome in time by cheaper power.—The first shipment of copper bullion from the Seven Devils district has arrived in Huntington. It consists of seven and one-half tons of copper from the New York & Idaho Smelting Co.'s plant near Cuprum.

Times: At Bailey the Tip Top mine has been sufficiently developed to permit the stopping of fifty tons of ore a day. A new tunnel will soon be begun that will tap the vein 10 feet lower than the present workings, and at that depth a sufficient supply of water for a 30 or 50-stamp mill will probably be secured. If this proves to be the case a mill will be built at the mine; otherwise it will be located on Rock creek, about a mile and a half away, where there is an ample supply of water. As it will take some months to drive the new tunnel and connect it with the upper works, it is likely that the proposed mill will not be erected until next spring. M. Packard is the owner of the property.—The ores of the DeLamar mine are said to carry an average of \$11 per ton, of which 85 per cent is recovered at a profit.

Boise Statesman: Work on the property of the Upper Boise Hydraulic Co. near Boise has been suspended. An injunction secured by the Twin Springs Placer Co. was served on the Upper Boise Co. The litigation involves the title to all the placer ground of the Upper Boise Co. It is understood, however, that the

desire on the part of the Anderson company is to secure possession of the waters of Sheep creek, which the Boise company had the use of.

Idaho City World: Six miles of the ditch and flume being constructed by the Basic Co. in the lower valley of Grimes creek are finished, leaving two miles to be done. The company expects to have the water at the power house by the end of July.—The dredge at Placerville is finished ready for running. It will be operated by the Bed Rock Dredging Co. Contracts have been let for a second dredge near Centerville to be completed Oct. 1. This will be operated by the Boise Dredging Co. The dredges have a capacity each of 3000 cubic yards per day.

UTAH.

The Utah mine in Tintic district made a shipment last week of high grade ore.—The Gold Belt and April Fool mines in the State Line district were sold to Butte, Montana, capitalists for \$20,000.—In the Annie Laurie mine near Richfield a 180-foot tunnel is all on ore. Nine men are taking out 1000 pounds of first-class ore per day, which is being piled on the dump pending shipment.—The Humburg and Uncle Sam mines, Tintic, owned by J. Knight, are taking out ten cars of ore a week, which gives high values in silver and lead and some gold. The payroll is \$10,000 a month.—The Ajax mine at Mammoth has opened an ore body of good value at 550 feet depth.

After tunneling a distance of 2100 feet and expending \$50,000 upon the undertaking, the Sterling Coal Co. has connected with its coal measure at Morrison on its dip, and will soon be producing large quantities of coal. It was two years ago that it was decided to abandon the incline from which water had to be continually pumped. Several seams were passed through in digging to the original point where there is a 14-foot seam.

At Park City the ore shipments last week were 1,781,000 pounds.—The Loring Bros.' mill will be ready for operation within two weeks.—Frame timbers for the large ore bins at the Silver King are in position and carpenters are rushing the work. The masonry walls on the bin grade are completed and work on the high wall for the new air compressor is being pushed.—Shipments for the week from Tintic were twelve cars concentrates, five bars bullion and ninety-five cars of ore.—From Silver City fifty-seven carloads of ore were shipped.

Bingham Bulletin: In the West Mountain district Mgr. Strickley of the Montezuma is sinking a new winze and station 250 feet from the surface. The old winze, 50 feet farther in, is showing a fine body of ore, but operations had to be suspended on account of water. A hoist and pump will be put in by Sept. 1.—The raise made from the drain tunnel of the Starlus to the surface for air is completed. The drain tunnel has reached gravel and terminates in a sump. Work in the incline will be resumed as soon as it is pumped out, and the drift of the 150 level is also to be extended.—The cyaniding mill being erected at the Star group in Pine canyon in Tooele county will be ready to make a trial run the 1st of August. The property is showing large bodies of cyaniding ore.—A raise is being made for air from the east drift of the Winnamuck 400. It will open a large amount of stoping ground. The east drift is pushing ahead and still in solid ore. From these points considerable ore is coming out, and there are twenty to thirty tons on the dump. It is galena, going well in silver.—The Badger Co. will soon start work with a considerable force.—Work has been resumed on the Levant, owned by Gov. Wells and E. Case, and considerable development work is to be done this summer.—Several of the Markham group claims are being worked under lease.—Results obtained by the Swan-Bemis mill on Niagara dump ore are very satisfactory. From twenty-five to thirty tons of concentrates are made daily.

Mercury: At Mercur the Geyser-Marion made its usual semi-monthly shipment of cyanides valued at \$7000.—At the Snowstorm the shaft reached the ore at a depth of 160 feet, and an incline has been run on the dip of the vein 140 feet.—At the South Daisy two shafts have been sunk 160 feet and a drift is being run to connect them, which will be 200 feet in length. The values are improving and there is no doubt as to the class of ore existing in the property. There will be no cessation to the work, and within a short time enough ore will be blocked out to justify the erection of a mill.—The owners of the Oakland have decided to continue operations on their property; they will put down a diamond drill to a depth of 1000 feet.—At the Daisy the mill is running steadily. Seven of the tanks have been filled and the eighth is ready to receive the ore. It is found that forty-eight hours' time is all that is necessary for leaching the ore.

The Joe Bowers mine, near Eureka, has a 25-ton shipment that assays 32 per cent copper and seventy-six ounces silver.

MONTANA.

S. F. King of Butte has bought the Calhoun mines near Phillipsburg. The ores of this property are of a uniform fine milling grade, and can be saved to a high per cent by the cyanide process. The pyritic ore exposed in the principal tunnel is the largest exposed body of this character of mineral known in the State. The latter is successfully treated by concentration and gives \$6 to \$32 per ton. The Mgr. is F. D. Brown.—The Keystone, at Sylvanite, is pushing work on its tunnel and is in good ore. Thirty men are at work on the Gold Flint mine, ten in the Keystone.—In the Gold Flint mine the tunnel is 600 feet and the ore is improving. The mine is producing 140 tons a day.

Work on the McCauley Milling Co.'s property at Crevasse has been resumed. Two 10-stamp mills are being operated night and day and a large force is employed in the mine. The ore encountered is free milling and of a

high grade.—The Butte and Boston Con. M. Co., in their annual report to the County Clerk, show a capital stock of \$2,000,000, all paid in. On July 1 last the assets were \$5,500,000; liabilities, \$1,600,504.42, and bonds amounting to \$1,500,000 were outstanding.—The Montana Ore Purchasing Co. is shipping low grade ore from the Nippur claim. It is understood that the bond has been taken up and the mine is now the property of A. Heinze and associates. Development work is also progressing satisfactorily on the Cora and Parnell, on both of which this company holds a bond.—In the East Pacific near Winston ninety men are engaged taking out high grade ore, and within the next sixty days the force will be increased to 125 men. Plans are being perfected for a fifty-ton concentrator to be erected in the near future.—The Big Bonanza near Walkerville, owned and operated by the Montana O. P. Co., is reported to have become a paying property. Shipments of silver ore are said to be giving returns of 100 ounces of silver to the ton.—Near Townsend, at the Diamond Hill, in a short time twenty stamps will be dropping.—Work has resumed in the Moulton mine near Nelhart. Over 100 men were formerly employed in this mine, and it is intended to put that large a force to work if the present price of lead is maintained. The other mines at Nelhart in operation are being worked extensively.

The Washoe Co. has acquired 4000 acres of land on Camp creek, near the Big Hole river, which is locally considered to verify the report some time ago that Messrs. Daly and Higgin, principal owners in the company, were about to build a big smelter there and start a new smelter town. Ores will be handled from the Butte mines of the company and properties on Moose and Camp creeks will be developed.

WYOMING.

The Charter Oak mine, near Grand Encampment, has a 225-foot shaft and three drifts of 100 feet all in ore. The vein is from 6 to 12 feet wide and the ore is low grade, running 8 per cent copper and \$4 gold per ton. The mine produces 150 tons of ore a month.

SOUTH DAKOTA.

The Durango mine near Lead made a thirty-ton shipment of ore to the smelter that yielded \$75 per ton.—The Wasp No. 2 mine near Deadwood is shipping 120 tons of ore a week that carries an average value of \$100 a ton.—The Burlington mine at Preston is shipping fifty tons of ore a week.

Because of the miners' strike in Blacktail the Cyanide Co. has been unable to work any property and the plant is shut down.

LAKE SUPERIOR.

W. F. Fitzgerald of some Lake copper properties says: "Osceola promises to be a large producer. The cost of treating copper at Lake Superior will be reduced during the next year. One of the mines is working on a scheme which, if successful, will greatly increase the capacity of a stamp, and likewise reduce the cost of stamping. Mining men are laying considerable stress on the way that the mines are increasing their production, holding that large production merely shortens the life of a mine, and that it will not be many years before the larger mines will have to open up new lodges or decrease their productions. The amount of ground used up by the larger mines in making their great productions is almost beyond comprehension. The asking price for copper by all of the large producers is 1½¢."

ONTARIO.

The Golden Star mine at Mine Center is down 292 feet and is producing free-milling ore that yields \$45 to the ton. The mill will be in operation Sept. 1st.—The Olive mine mill is running and the work of putting in the additional stamps is progressing. The Olive is said to be turning out with its two stamps an average of \$600 per week.

At the Golden Star mine, near Rat Portage, the shaft is down 292 feet, the quartz becoming better as the shaft deepens. There are ninety men employed.—Development on the Golden Crown property is being pushed. Two shafts are being sunk on good ore.

NEW MEXICO.

(Special Correspondence).—The St. Louis United Copper Co. has begun the erection of buildings on its property in the Jicarillas.

The Lillian tunnel, on upper Bitter creek, is being pushed night and day, and is in over 600 feet.

D. B. Gillette, Jr., superintendent of the Hearst properties in Grant county, has been seriously ill for some weeks past, and the business is now being attended to by B. B. Thayer, of San Francisco.

A lead smelter has recently been erected in the Caballo mountains for the purpose of treating the ores from several fine lead claims in that vicinity.

The old Terry gold mine in Water canyon, Socorro county, is being actively worked by the new company in control.

The work being done on the Miners' Union, at Bland, proves that property to be fully as rich as expected.

Hundreds of placer claims in the territory, upon which nothing can be done most of the time for want of water, are now being worked vigorously, the heavy rains of the last few weeks having given a good water supply.

All the heavy machinery for the big cyanide plant in Colla canyon, Cochiti district, is now in place, and it is announced that the mill will be ready to commence active operations in the early part of the coming month. It is the biggest establishment of the kind in the territory.

The new machinery for the Silver City reduction works is in place, and that institution has blown in its furnace again. The improvements consist of a Corliss engine, new boiler, and concentrate press. Two stacks with a capacity of sixty tons each per day are being operated. A very large amount of ore

has accumulated during the temporary suspension of the works.

Albuquerque, July 24th, '98.

The first run of the mill at Hematite on a 300-ton lot of ore resulted in a saving of 92 per cent of the assay values. The mill was erected at a cost of \$5000, and has a capacity of twenty-five tons per day. The ore is crushed and rolled to sixty-mesh fineness, then leached by a weak alkali solution. The extraction is made in from one to four hours and the cost of treatment is less than \$1 per ton.—A 6-foot vein of ore has been opened in the Albemarle mine, Cochiti district. Several thousand tons of ore are on the Albemarle dump at Bland awaiting the completion of the new mill.—A sixty-days option has been secured on the Hatch & McKay property in Mallette canyon at Red River by the Hematite Mill Co.—The Baca mine at Red River is producing \$30 ore.

On the Surprise mine near Hanover lessees are shipping a good grade of lead ore to the smelter.—A strike of copper-iron ore was recently made on a claim worked under lease by J. & P. Welsh, which runs high in copper and iron.—At Santa Rita the S. K. Copper and Iron Co. owns seventy-seven claims, covering nearly 1500 acres. The formation is an isolated peculiarity in geology. The copper ore intimately permeates every portion of the formation in an area of more than 1000 acres. There are 150 men employed in the mines, most of them working on the tribute system, paying a royalty to the company, the low grade ore thrown over the dump reverting to the company, to be utilized when proper appliances are at hand. Every one of the tributaries is making more than ordinary wages, besides paying a royalty. The production of ore from these mines last month was more than 600 tons, which averaged 21 per cent copper at smelting works.

Since the completion of the railroad from San Jose to Santa Rita last month there were shipped to the smelter 1200 tons of iron ore and 600 tons of copper.—Six hundred tons of ore shipped from Santa Rita ran 39 per cent copper.

Sinking has been resumed on the shaft of the Atlantic mine at Pinos Altos. It is down 480 feet and will be continued to 750 feet before ore is extracted in any quantity.—The Gillette shaft of the Pinos Altos G. M. Co., operating at Pinos Altos, is down 700 feet and will be continued to 1000 feet depth.

COLORADO.

(Special Cripple Creek Correspondence).—The Doctor mine, on Raven Hill, which was inactive for several months, has started up again and is taking out low grade ore.

The Jack Pot, under lease, made a new strike recently and has shipped some six-ounce ore. Its vein runs into that of the Work.

The Ingham is being worked in a small way. It is claimed the bad timbering in the mine has retarded the work.

Eclipse No. 1, being worked under lease, is shipping ore in small lots.

On Bull Hill the Gold Sovereign is shipping ore of fair grade.

The American Eagle has ore at 800 feet depth.

The Modoc has fifteen-ounce ore at 600 feet depth. This property has a new shafthouse and new machinery.

The Hill City Placers, at Independence, all under lease, are producing from \$60,000 to \$70,000 per month. This constitutes the most important new work in the district.

The Vindicator ships from 1500 to 1800 tons per month, one-third of which goes to the smelters and the rest to the mills. The product gives a net value of \$25 per ton of mill ore and \$100 per ton smelter ore.

The Lillie ships 1200 tons per month, which averages two and one-half ounces per ton.

The Pharmacist ships 75 to 100 tons per month, the values running from one and one-half ounces to forty ounces per ton.

The tonnage from the principal mines may be summarized in the following estimates:

BULL HILL MINES.

| | Tons per month. |
|------------------------|-----------------|
| Victor | 3,000 |
| Isabella | 1,300 |
| Los Angeles | 1,300 |
| Modoc | 750 |
| Last Dollar | 1,300 |
| Vindicator | 1,800 |
| Hill City Placers | 2,200 |
| Lillie | 1,700 |
| Union | 500 |
| Christmas | 2,500 |
| Longfellow | 3,500 |
| Pinto | 2,500 |
| Specimen | 2,500 |
| Free Coinage | 2,500 |
| Shurtloff | 2,500 |
| Garfield-Grouse | 2,500 |
| Favorite | 2,500 |
| Pharmacist | 2,500 |
| Burns | 2,500 |
| Mountain Beauty | 2,500 |
| Beacon Hill Properties | 600 |

BATTLE MOUNTAIN MINES.

| | |
|---------------------|-------|
| Portland | 3,600 |
| Strong | 1,000 |
| Independence | 1,000 |
| Gold Coin | 3,000 |
| Granite & Dead Pine | 1,500 |

BEAVER HILL MINES.

| | |
|------------------|-------|
| Elkton | 1,800 |
| Raven & Jack Pot | 1,500 |

GOLD HILL MINES.

| | |
|------------------|-------|
| Anchorage-Leland | 1,300 |
| Half Moon | 1,300 |
| Moon-Anchor | 1,500 |

Two years ago very few Cripple Creek properties were under lease. Now it is believed three-fourths of all the shipping properties are in the hands of lessees, who as a rule are experienced mine operators.

A great many of the mine dumps in Cripple Creek district are leased to miners who are saving the values therefrom by a washing and sorting process. A box the size of a wagon-bed is placed on the ground beside the dump and partially filled with water, within the box is a smaller screen-bottomed box

which is churned up and down in the water as the ore is shoveled into it. The slimes pass through the screen bottom into the main box, from which they are afterwards gathered and shipped to the smelters. The coarse ore in the small box is sorted and the better grade shipped with the slimes. Some of the "washers" are thus making about \$100 per week, though others make considerably less.

Victor, Colo., July 23rd, '98.

BOULDER COUNTY.

In the Red Cloud mine at Gold Hill, on the 90-foot level, J. Williams uncovered a vein of ore said to yield \$50 a pound. The vein is supposed to be the old ore body for which they have been looking for over twenty years.—The Village Bell mine at Eldora continues shipments of good ore. The monthly payroll amounts to \$3000.—The body of high-grade ore found in the San Blas, Ward district, has increased until it is 5 feet wide. The tunnel has been driven 1000 feet. The Enterprise mine, Eldora, makes a twenty-ton daily shipment. A ledge of black quartz has been found carrying tellurium and a test of eighty pounds yielded \$40 per ton.

CHAFFEE COUNTY.

Mabel Grace ore, Whitehorn district, gives a general average of \$34 per ton. The highest value is eight ounces in gold and \$2 in silver. Work is progressing at the rate of 18 inches per shift. The rock is soft and timbering is slow work.

CLEAR CREEK COUNTY.

J. Todt, on the Foyer mine, near Idaho Springs, has 6 inches of \$70 ore. He is driving into the hill with good results.

DOLORES COUNTY.

The concentrator at Rico is busy on the ores of the camp. It received fifty tons of ore from the Little Maggie, twenty from the Montezuma and forty from the Burns property.

EL PASO COUNTY.

The Copper Mountain mine lease on the Fluorine at Cripple Creek shipped last month 500 tons of ore of an average value of 2½ ounces to the ton, and it is admitted that this rate of production can be maintained until the termination of the lease next December.—Twenty tons of screenings were sent out from the Newell tunnel, taken from the dikecut at a distance of 1000 feet and a depth of 525 feet. The vein ranges from 25 to 40 feet in width. If this trial shipment comes up to the expectations of the management, it will be the developing of a hitherto unprofitable section of the camp. The property is equipped with air drills and machinery and is in shape to make heavy shipments at once if the returns warrant.—Two carloads of \$30 ore were shipped from the Carey and Rankins lease on the Little May.—The Portland production for the present month will run, according to the latest estimates, between 3500 and 4000 tons.—The June production of the Half Moon mine at Cripple Creek was 1919 ounces of gold, amounting to \$38,353 30 net.

GILPIN COUNTY.

The last shipments of ore from the Black Hawk depot of the U. P. R. R. were twenty-four cars, nearly 400 tons. Indications point to heavy shipments this month.

GUNNISON COUNTY.

The Tabor mine, on Whitehouse mountain, is throwing out lead carbonates in boulders that weigh nearly 500 pounds. One boulder of lead weighing about 6000 pounds was uncovered and a single piece weighing 1500 pounds was taken out. The ore carries 100 ounces silver, 70 per cent lead, steel galena, crystallized lead and carbonates.

LAKE COUNTY.

The Nisi-Prius mine, Leadville, has the credit of shipping the highest grade ore that leaves the camp. The new ore bodies on the lower level are growing into great producers. The company paid \$30,000 dividends during the first four months of the year.—In the Maid of Erin, above the 700-foot level, enough ore is taken out to make a daily shipping of 100 tons. The ore is lead carbonates, lead sulphides, copper-iron and iron oxide. The property is worked by a leasing company that has granted twenty-two sub-leases.

PARK COUNTY.

The Hill Top Co. has leased twenty-two claims in Horse Shoe from the Stormy Petrel Co. The Hill Top is building a mill and will develop the territory added by the lease to its producing ground. A good strike of gray carbonates was made a short time ago in the Hill Top.

SAN JUAN COUNTY.

A new ore chute has been found in the Ridgway mine, near Silverton. The ore body assays \$180 in gold and \$250 in silver. The old workings continue to output high-grade ore.

SAN MIGUEL COUNTY.

The Shoemaker mine at Telluride continues its output of high-grade gold ore and keeps five stamps of the Suffolk mill dropping on \$35 ore. About ten tons per day are packed to the mill and twelve men extract the product.

ARIZONA.

At Prescott a cave-in occurred at the United Verde copper mine this week, destroying the assay office and part of the foundry. E. W. Johnston, civil engineer, C. E. Beveridge, assayer, and T. E. Larson were killed. A mining expert from New York, whose name is not given, was seriously injured.

The West Oro Bonita mine, near Tucson, has a tunnel on the vein nearly 200 feet, with an ore streak of \$40 gold rock 2 feet in width. The Mohawk G. M. Co. is going down 400 feet. The thirty stamps are dropping on good grade gold ore.

Kent & Son, owners of the Lottie and Postmaster mines, have a tunnel 400 feet long; six men are at work on it.—The mining suit of Jordan vs. Duke, involving the copper property near Jerome, Yavapai county, has been appealed to the U. S. Supreme Court. The

case has been in litigation under one form or another for several years, and has been tried in three counties, resulting in judgments for the defendant. The Territorial Supreme Court at its last session affirmed the judgments. Eight carloads of ore have been shipped from Kingham since the first of the month. The erection of a 20-stamp mill is contemplated at the Yellow Dog mine near Yuma.—A cyanide plant has been put in operation at the King of Arizona mill at Mohawk and is giving satisfactory results.

Regular shipments of ore from the Silver Thread mine near Tombstone continue. Some of the ore from this property is said to be the richest ever produced in the Tombstone district.—The Carr Bros. are shipping ore from La Cruz mine, Cedar district, to the smelter at Barstow, Cal.

The plant at the Temple Bar Consolidated M. Co. is nearly finished and the pumps will be installed immediately. The Colorado river has begun to fall without having risen this season higher than 9 feet 10 inches above low water mark, and without having brought any driftwood of consequence. On the completion of the erection of the machinery the gravel washing will commence.—The Rosemont Copper Co. has about 1500 tons of ore on the dumps of its properties at Rosemont, Pima county. Its claims are being rapidly developed.

Phoenix Republican: At the Welles property in the Dragons, seven men are employed and the mine is looking well.—The long drought of the past year has dried up the springs and source of water supply at Chloride to such an extent that the big mill at the Elkhart mine is unable to run to its full capacity.—At Big Bug, M. S. Taft is rapidly developing the Sterling mine. This shaft is 100 feet deep, in the bottom of which is good ore.—In both drifts there is a ledge 1½ feet wide of good ore. About twenty tons of shipping ore are on the dump.—The Little Annie has stopped work until an air compressor and a drill can be obtained. The Providence M. Co. contemplates placing a smelter about a mile from their mine.

LOWER CALIFORNIA.

J. O. Brown and associates of Riverside, Cal., have secured 570 acres of placer ground near Escondido and will operate extensively. They will be known as the Piramide Mining Co.—A 10-stamp mill is en route to the Aurora mine at Santo Domingo. There are 3000 tons of ore on the dump of the mine ready for milling.

MEXICO.

At Las Planchas the Big Four M. Co. is building a tramway and an 80-stamp mill. Operations in that region will be carried on upon a magnitude never before known there. The roasters at Minas Prietas, Sonora, have started up on the tailings from the old mill, and cyaniding the roasted tailings will soon begin.—The new Wyman shaft in La Mina Colorado is below the 700-foot level and is expected to cut the vein in a short distance. Connection will then be made with the old workings of the mine.

The Montezuma M. Co. at Montezuma, Sonora, is about to erect a new smelter. The company employs 700 men.

Since the opening of the railroad between Saltillo and Concepcion del Oro, development of the old mining district of Mazapil and Concepcion has taken a fresh start, resulting in such increase of the movement of lead and copper ores that the English capitalists interested in that section are talking of establishing a large smelter. All branches of business are profiting by the recent large increase in the mines throughout Zacatecas.

Personal.

A. B. PAUL has returned to San Francisco from Shasta, Cal.

C. P. SULLIVAN becomes Supt. Carson Creek mine, Robinsons, Cal.

H. L. BENNER becomes Mgr. Sacramento mine, Mercur, Utah, Aug. 1.

S. B. MILNER has been appointed Gen. Mgr. Dexter mine, Tuscarora, Nev.

H. A. RAMSTETER will be Gen. Mgr. Grub Stake M. Co., Virginia, Mont.

EX-GOV. BLAISDELL is visiting his mining property in Mariposa Co., Cal.

C. K. BANNISTER of Ogden has been appointed State engineer of Utah.

F. W. WILMANS, Pres. Rose Creek M. Co., Sonora, Cal., is in San Francisco.

C. JENNENS has been appointed Gen. Mgr. Village Belle mine at Eldora, Colo.

J. C. BOYD has resigned his position with the Guston M. Co., at Guston, Colo.

CHAS. B. WORES is about to revive his sampling works at Tucson, Arizona.

J. SNYDER, Supt. Pop Gold Mines, Casa Grande, Ariz., is in Los Angeles, Cal.

WM. JOHNS, Supt. Whitlock mine, Mariposa, Cal., has returned from San Francisco.

COL. EWING of Diamond Hill, Montana, fame is operating at Kingman, Arizona.

D. EVANS of Ogden is at Fish Springs, Utah, examining the Utah and Galena mines.

F. X. LA BONTÉ of the Marino Mariscani mines at Ono, Cal., is in San Francisco.

R. S. SPENCE, chief owner Humming Bird, Paris, Idaho, is in Salt Lake City, Utah.

J. L. FLOOD of San Francisco is visiting his Allison Ranch mine at Grass Valley, Cal.

F. CORNHILL, Supt. Dead Horse mine, Jamestown, Cal., is at Candelaria, Nevada.

B. F. HARTLEY, Supt. Zantgraft mine, New Castle, Cal., has returned from San Francisco.

E. SALADIN, Supt. Cle Fse Hydraulic mine, Junction City, Cal., is en route to Paris.

J. J. SULLIVAN, Supt. Golden Valley M. Co., La Bura, Mexico, is visiting in Denver, Colo.

D. FRICOT, owner Independence mine, Grass

Valley, Cal., has reached that place from an inspection trip to his mines in Calaveras Co., Cal.

M. W. GIBBONS, of the Kasser G. M. Co., has returned to Globe, Arizona, from California.

G. Crimson of Salt Lake City, Utah, is visiting his Eagle mine at Baker City, Oregon.

C. T. DURNING, Supt. Gray Eagle mine, Forest Hill, Cal., has returned from San Francisco.

S. W. CHEYNEY, Supt. Jamieson mine, Johnsville, Cal., has returned to San Francisco.

A. VOSS, secretary-treasurer Phoenix G. M. Co., Nevada City, Cal., has returned to Covington, Ky.

G. P. HOLMAN, Salt Lake City, Utah, is visiting his Cope placer mines near Dillon, Montana.

W. J. BATCHELOR, Supt. Crown Point mine, Grass Valley, Cal., has returned from San Francisco.

H. A. COHEN, Capt. De Lamar's Mercur, Utah, manager, is on a wedding tour in British Columbia.

F. R. BIELEN, Baltimore, Md., is in Prescott, Ariz., looking after the interest of the Virginia G. M. Co.

J. P. EVANS, auditor Colorado Iron Works Co., Denver, Colo., accompanied by his wife, is in San Francisco.

C. A. HAMILTON has returned to San Francisco from an inspection trip to the San Justo mine, at Angels, Cal.

P. KERWIN of the Comstock at Virginia, Nevada, is at Grass Valley, Cal., examining the Allison Ranch mine.

Geo. CROCKER of the S. P. Co. is putting \$100,000 into the development of the Alice mine, Idaho Springs, Colo.

J. W. FRANK is Gen. Mgr. and part owner in the new company operating the Mountain Boomer mine, Denny, Cal.

R. NICHOLS, formerly Supt. Sutro tunnel and now a mine manager at Coolgardie, West Australia, is in Virginia City, Nev.

J. H. HUTCHINSON of the Trade Dollar mine, Halley, Idaho, is examining the mining industries in the Seven Devils country.

E. J. MURRAY of San Francisco, old-time Mgr. Trinidad mine, Sonora, Mexico, is the new Supt. of the Santa Rosalia mine.

D. H. JACKSON of Placerville, Cal., becomes Supt. Holmes mines at Candelaria, Nevada, upon which work will shortly be resumed.

CHAS. H. KARLSRUH, Pres. Phoenix M. Co., Nevada City, Cal., has returned to Cincinnati, Ohio, after an inspection of the mine.

J. SONNAG, Sec. Cal. State Miners' Association, has returned from a trip to Grass Valley, Cal., in the interest of the organization.

M. FLYNN has resigned as manager of the Sacramento at Mercur, Utah, to accept the superintendency of a gold mine in New South Wales.

F. RICHMOND, Supt. Golden Gate mill, Mercur, Utah, has resigned to accept a position with a machinery company in the City of Mexico.

O. S. BUCKBEE, who went to Fort Mohave, Ariz., a few weeks ago to become Supt. Sheep Trail Mine, is at his home in San Francisco in ill health.

J. J. CRAWFORD becomes secretary of the Eureka Con. Drift M. Co. of Forest Hill, Cal., with office at 1209 Claus Spreckels Bldg., San Francisco.

DR. A. OPPEL of Bremen, Procs. Geographical Society of Germany, who has been studying the mining resources of California, has returned home.

J. C. BOYD of the Guston M. Co., at Guston, Colo., is on his way to Tasmania via San Francisco, whither he goes on mining business for his company.

C. N. STEWART, Mgr. Scottish Joint Trust Co., London, England, having examined mining properties in Mexico and California, has returned home.

J. D. GILLETTE Jr., Gen. Mgr. Hearst copper mines, Silver City, N. M., is reported seriously ill. His place is temporarily filled by B. B. Thayer.

W. J. SUTHERLAND, Gen. Mgr. Holmes M. Co., Candelaria, Nevada, is in San Francisco gathering estimates for machinery, preparatory to resuming work.

R. PRET, Gen. Mgr. French Swiss Mines, La Plata, Colo., has gone to Paris and Berne to confer with his company about erecting reduction works at La Plata.

MAJOR MYERS, a prominent miner of Siskiyou county, Cal., has recruited 200 mounted riflemen, "Siskiyou rough riders," but so far has been unable to get them accepted.

J. F. ALLAN, Gen. Mgr. Mexican G. & S. Co., with headquarters in the City of Mexico, has been inspecting his company's mines at Hermosillo and Matape in Sonora, Mexico.

JOAQUIN MILLER has got back from the Klondike, where the aged poet spent a year. He is at Byron Springs, Cal. He says there are 40,000 men up there, 5000 of whom have secured some gold.

T. M. IRWIN has been made Mgr. of the King of Arizona M. & M. Co. at Chrystal, Arizona. Mr. Irwin was recently connected with the Canadian Pacific Exploration Co., Ltd., as their local Mgr. in the Province of Ontario.

M. B. KERR, M. E., has returned from two months' professional visit to Santiago de Costa Rica, via Kingston, Jamaica, and the Bahama Islands. At the former place he got first news of the destruction of Cervera's fleet off Santiago de Cuba, twelve hours in advance of the receipt of the news in this country.

Coast Industrial Notes.

—Southern Oregon hay is \$9 per ton on the cars.

—Redlands, Cal., proposes to have an electric street railway system.

—The San Francisco Mechanics' Institute will hold no exposition this year.

—Douglas county, Oregon, has 100 carloads of dried prunes ready for shipment.

—The pumps at Coronado Springs, Cal., are raising 850,000 gallons of water daily.

—P. L. Orcutt of Boston has bought 45,000 lbs. wool in eastern Oregon at 15½ cents.

—Never before was the Pacific ocean so full of vessels as now. The war and the Klondike did it.

—Flagstaff, Arizona, has contracted with G. W. Sturtevant, Jr., for water works to cost \$85,000.

—Last Sunday and Monday ninety-nine carloads of fruit were shipped East from Sacramento, Cal.

—The new freight rate on rough pine or redwood lumber from San Francisco to New York is 60 cents.

—From Astoria, Or., were shipped last week twelve carloads of Columbia river salmon to London, England.

—The walnut crop of Orange county, Cal., for this season amounts to 475 carloads and is valued at \$500,000.

—Fresno, Cal., is shipping forty carloads of melons daily to the trade centers of California and the Northwest.

—Twenty-five carloads of combined harvesters were recently shipped from Stockton, Cal., to Oregon and Washington.

—The Warren Live Stock Co. of Cheyenne, Wyo., sold to I. N. Humphrey of Cedar City, S. D., 2500 head of cattle for \$90,000.

—The business of the Los Angeles, Cal., clearing house banks for the three months ended June 30th, '98, was \$36,821,785.54.

—Up to July 17 the orange shipments from southern California were 14,209 carloads. Shipments for the season will be over 15,000 carloads.

—The Northern Pacific land department during the year ending June 30 sold 616,679 acres of land, of which 500,000 were in Washington.

—One hundred and fifty horse power will be furnished by the Big Creek Company, Santa Cruz, Cal., to operate the machinery at the powder works.

—Domestic and foreign shipments of redwood lumber from Humboldt, Del Norte and Mendocino counties, Cal., last month were 10,553,855 feet.

—Fresno, Cal., papers say "meadows that have been boggy for years have dried up and are dusty. The streams and springs are nearly all dry."

—The gross earnings of the Mexican National Railway for the second week of July were \$113,374.97, against \$96,411.53 for the same week last year.

—Estimates in California of the per cent of different timber sawed are as follows: Redwood 50, yellow pine 20, sugar pine 15, Douglas spruce 10 and fir 5.

—Our Alaskan possessions, which we acquired in 1867, extend 1500 miles farther westward than the Hawaiian Islands, which we have just acquired.

—At Santa Cruz, Cal., W. P. Peyton this week discovered a process for the condensation of ether that effects a saving of \$400 a day at the powder works.

—The S. F. & S. J. Valley road, Cal., has let contracts for grading two miles of road on the extension west of Stockton, between Stockton and the San Joaquin river.

—The North Pacific Coast railroad, operated in Marin and Sonoma counties, Cal., for the year ending December 31, 1897, earned \$356,993.60; expenses, \$245,888.73.

—Salt Lake City, Utah, proposes to at once float a \$500,000 issue of straight twenty-year gold refunding 4 per cent bonds with which to take up the 1888 issue of 5 per cent bonds Sept. 1.

—The whaling crews at Point Barrow, Alaska, to whose relief an expedition was sent from San Francisco on the revenue cutter Bear last fall, are in good condition and were at no time in danger of famine.

—The season's surplus wheat crop in the Columbia river basin and Willamette valley is estimated at 1,050,000 tons. It is thought that at least 25,000,000 bushels of grain will be exported through Portland this year.

—In Los Angeles, Cal., placing the electric, telegraph and telephone wires underground has cost \$600,000, and it is estimated that before the work is completed the outlay will reach three-quarters of a million dollars.

—A default decree against the city of Spokane, Wash., for \$152,000 in favor of the Rhode Island Mortgage and Trust Co. has been set aside by the Supreme Court of the State. The judgment was for street grading.

—In the Sacramento, Cal., railroad shops 2350 men are employed. Recently the shops have turned out 100 cars for hauling crude petroleum in southern California. Each car carries a cylindrical iron tank which will hold 5000 gallons of oil.

—A farmer at Peatlands, Orange county, Cal., has harvested sixteen tons of good barley hay from three and one-half acres of land, and is now planting the same ground with celery. And still, says the Los Angeles Times, this is a dry year.

—The Rock Creek dam of the Electric Light and Power Co., Nevada City, Cal., is completed to a height of 35 feet. It is to be raised 15 feet more. The ditch, flume and pipe line

leading to the works on the South Yuba river, two miles below, are in process of construction. Under this new arrangement the company will have a fall of over 800 feet.

—A new oil field has been discovered in southern California. The new discovery was made by Jonathan Begg, the mining locator, and lies between the Santa Ana range of mountains on their eastern slopes and Elsinore lake, Riverside county.

—A. A. Robinson, re-elected president of the Mexican Central Railway Co. at the annual meeting, says that the exports of Mexico for '97 were valued at \$112,000,000, of which the exports of metals were worth \$80,000,000, and all products of orchard, farm and forest \$32,000,000.

—Charles Denby, Jr., former secretary of the American legation at Peking, China, says that "within twenty years there will be 20,000 miles of railroad in operation in China. The internal development of the Orient has just begun. America's footing in Oriental trade will be broadened and our prestige in the affairs of the Far East greatly increased."

—The State of California has already furnished over 6000 soldiers to the war with Spain. This is more than 20 per cent of all the troops that have been assembled in and about San Francisco during the past three months. Of California's 6000, practically 3000 have already embarked for Manila. No other State in the Union is believed to have furnished so large a proportional representation in the volunteer army.

—The Carson & Colorado Railway Co. has petitioned the California State Board of Equalization that the assessed valuation of that portion of the company's road operated in California be reduced from \$230,000 to \$70,000. The superintendent states that the business which the railroad was built to handle has ceased to exist. The road runs from Mound House, State of Nevada, to Keeler, on Owens lake, in California, a distance of 300 miles, 107 of which is in California, the remainder in Nevada.

—At the meeting of the Los Angeles, Cal., Oil Producers' trustees on the 25th the price of their crude petroleum was advanced to \$1.15 a barrel. The chief reason for this advance, as explained by Secretary Stasburg, is that the present supply above ground is decreasing, instead of increasing, and that the trustees have been obliged to call upon their reserve to fill their contracts, and that the quantity in the tanks in the field and also in their own tanks is steadily growing smaller.

—C. Van Orden of Sacramento, Cal., proposes to trolley the Sierras. The South Yuba Ditch Co., of which he is secretary, owns twelve square miles of watershed in Summit valley in the high Sierras. He proposes to operate the Central Pacific R. R. by electricity between Sacramento and Verdi, Nev., 144 miles, the power being generated from the water stored in the shed at Summit valley. It is impossible at present to run more than fifteen trains over the divide in one day. Mr. Van Orden claims that his scheme will permit the operation of sixty.

—The gunboat Iroquois, formerly the tug Fearless, will make the longest tow ever undertaken. She is to haul the ship Tacoma from San Francisco to Manila by way of Honolulu, a distance of about 6600 miles. The Tacoma is to carry 100 horses and 120 mules and a coal supply. The Iroquois will steam to Honolulu, a distance of 2100 miles, on her own coal. At Honolulu she will recoil from the bunkers at that port and then proceed to the Ladrões and there getting into smooth water, will take on sufficient coal from the Tacoma to carry her through to Manila.

—At the new Salinas, Cal., beet sugar factory are several artesian wells 4 feet in diameter. A 10-inch centrifugal pump has been worked on one of these wells, drawing 1200 gallons of water a minute without lowering the water level. Another accessory is a 3,000,000-gallon reservoir, in the construction of which 10,000 barrels of cement were used. The factory, when completed, will cost \$2,500,000, will use 13,000,000 gallons of water per day, will consume 1200 barrels of oil daily for fuel, will crush 3000 tons of beets and will produce 450 tons of sugar. The operating expenses per day will be \$12,000 for beets and \$5000 for labor.

—The following shows the decrease in the import of prunes for seven years:

| Year. | Quantity, lbs. | Value. |
|-----------|----------------|--------------|
| 1891..... | 4,012,571 | \$2,130,070 |
| 1892..... | 10,374,874 | 490,078 72 |
| 1893..... | 23,255,821 | 1,049,896 48 |
| 1894..... | 8,749,349½ | 413,769 51 |
| 1895..... | 15,311,695 | 533,748 21 |
| 1896..... | 832,941 | 71,512 54 |
| 1897..... | 736,987 | 74,165 46 |

The trade appearing here as lost to Europe has all been gained by the Pacific coast, where the production of prunes last year amounted to quite 100,000,000 pounds. The growers of the coast have received the money which formerly went to those of France and Hungary.

—The biennial report of the bureau of highways has the following in regard to roads in Stanislaus county, Cal.: "It is the custom to cover the roads in the summer season with refuse straw, which is abundant. This is the most temporary makeshift. The cost of the straw varies from \$30 to \$45 per mile, and in many instances must be repeated two or three times a season. Nor is this all. It frequently happens that a lighted match or cigar is dropped on a freshly strawed road, and the whole roadway vanishes in smoke. It is a well-authenticated fact that, on one occasion, on the day after the road had been strawed, a band of hungry cattle came along and actually ate the road up."

—President McKinley has set aside a number of new tracts recently for forest purposes. The latest enlarges the Pine Mountain and Zaca Lake forest reservation in the southern part of California. The reservation before being enlarged comprised 1,159,000 acres, and

the addition increases it by 507,000 acres. The bulk of the addition is on the eastern end of the original, and it now forms the connecting link with the San Gabriel forest reservation. This makes a complete chain of reservations, extending along the Coast Range mountains from the southern part of San Luis Obispo county to the middle of San Diego county. These reservations, in their order, are: Pine Mountain and Zaca Lake, San Gabriel, San Bernardino and San Jacinto. It is learned that the President will soon set aside several more timber tracts in the eastern and north-eastern parts of California.

—The development of electric power at the two big plants in the vicinity of Redlands, Cal., has been likened to the opening of inexhaustible coal mines. It is stated that it requires 34,560 pounds of coal to generate 1 H. P. for one year by means of steam. The Redlands Electric Light and Power Company has a plant producing 1000 H. P. in electricity and the new plant will produce 2000 H. P. additional. The plant of the Southern California Power Company will produce 4000 H. P., making 7000 H. P. in electricity produced by the two companies in Mill Creek and Santa Ana canyons. This is equivalent to the consumption of 120,960 tons of coal per year in the making of power by steam. With coal at \$4 per ton, this means \$483,840. Dividing this by 300, as the number of working days, gives an average of 403, which may be said to be and is the equivalent of this number of tons of coal mined per day, and as the water flow is continuous, these plants, says the Times, may be likened to inexhaustible mines producing this enormous output.

—The Northern Pacific railway has restored the wages of the engineers, firemen and passenger train conductors in its employ to the standard that prevailed on the road prior to the general cut made in 1893. This means an advance of from 10 to 15 per cent. Some have contended that the raise may have been prompted by a likelihood that the men might go to war if an extra inducement were not held out to them to remain at work. The wages that have been paid engineers on the Northern Pacific since 1893 have ranged from \$3.75 to \$4 a day, the difference being in accordance with the size of the engine. Ten hours or less or a run of 100 miles or less is counted as a day, and all overtime is paid for at from 3½ to 4 cents a mile or 35 or 40 cents an hour. The new wages are from 10 to 15 per cent increase for the regular ten-hour day and provides for 40 cents an hour for overtime. The basis of ten miles to an hour is most commonly used, and oftentimes the wages of the men are considerably in excess of the so-called day's wages. Engineers of the heavy mountain engines get as high as 47 cents for overtime. The wages of the firemen have been paid on the same plan as that of the engineers, and they average \$2.15 a day. The new wage is \$2.35. The old rate of overtime was 20 cents; the new rate is 35 cents. The wages for passenger conductors have been \$112.50 a month. The new wages are \$125.

—Says the Boston Financial News: "E. E. Jones & Co. and W. Stanton & Co. saw a good thing in Hawaiian bonds and hustled. The hustle was fruitless, only because the walking is not good between San Francisco and Honolulu. The idea was all right, and it is the enterprise of these firms that makes bond houses smile. Apparently, W. Stanton and H. H. Pearson, Jr., representing the two firms named, had made a special business of keeping themselves informed as to the probable action of our Government on the annexation of Hawaii. When the "straight tip" was given, they rushed across to San Francisco to take passage for Honolulu, where they meant to buy the Hawaiian 5% bonds, amounting to \$4,000,000 (and they would probably have got them at about 112), before the annexation resolutions passed the Senate. But our Government had chartered all available steamers to carry troops to Manila. The would-be bond buyers obtained permission to go on one of the transports as assistant pursers, but instead of getting off June 1st they did not sail until June 15th. Upon arriving at Honolulu they found that both Houses had passed the refunding bill, authorizing the issuance of fifty-year bonds amounting to \$4,000,000, with the option of calling them at any time on six months' notice. In other respects the form of bond was not satisfactory. The enterprising New Yorkers immediately took steps to have the bill amended, but before the necessary legislation could be put through, news arrived from Washington announcing the passage of the annexation resolutions. Negotiations were at an end and Messrs. Stanton and Pearson leisurely returned to the United States. Had it not been for those two weeks lost at San Francisco their peculiar enterprise would doubtless have been richly rewarded."

—The advance of the United States into the markets of the world is presented in a Government publication just issued. Although no reference is made to recent geographical and political changes resulting from the appearance of the United States army in the Philippines, Cuba, Porto Rico and elsewhere, yet the review deals with the important part which American enterprise and capital are taking in the development of the Far East. The United States is no longer the "granary of the world" merely. While its exports of agricultural products have increased to a remarkable extent during the past year, its sales abroad of manufactured goods have continued to extend with a facility and promptitude which have excited the serious concern of countries that for generations had not only controlled their home markets, but had practically monopolized certain lines of trade in other lands. China has for some years been one of the most promising fields for American enterprise, industry and capital, and the entrance of the vast empire upon the path of Western development under conditions which would secure equality of opportunity to the United

States would doubtless result in immense gain to our manufacturers in the demand, sure to follow, for lines of supplies and goods of various descriptions that we are fitted to provide. The solution of the problem of the future commercial conditions of the Chinese empire has, therefore, an immediate and most important relation to the expansion of our export trade, especially that of our Pacific slope. The "internationalization" of the United States, so far as industrial and commercial interests are concerned, has, in fact, been made a thing of the past by the logic of the change in our economic requirements, and we can no longer afford to disregard international rivalries, now that we ourselves have become a competitor in the world-wide struggle for trade. Nor is it with the relation of the different nations toward one another that we are alone concerned. The industrial changes current within the territory of each obtain a new and much graver importance in their possible effect upon our nascent development as an exporter of manufactured goods. The conditions contributing to the rapid growth of manufactures in recent years; the fiscal changes in Russia, India and Japan, as well as in some of the Latin American countries; the extraordinary impulse given to the industrial and commercial growth of the German empire as a factor of international trade; the advance of Russia on similar lines and the rapid progress of the Siberian Railroad toward an open port on the Yellow sea; the efforts of Great Britain to meet the encroachments of other nations; the decline of the sugar industry in the West Indies as a result of the beet sugar competition; the troubles of Spain with her colonies; the discovery of gold in Alaska and the adjacent territory in British Columbia; the tariff legislation of the United States, Canada and other countries—all the phases of economic changes during the past year have and interest and importance for the individual operative in the United States which are greatly enhanced by the transformation now going on in our industrial life, converting us slowly but surely from a people absorbed with the internal development of a virgin continent into one of the great commercial powers of the world, with the international interests and responsibilities which such a position naturally implies.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING JULY 17, 1898.

607,727.—BICYCLE HUB—J. Baker, Pasadena, Cal.
607,730.—POLISHING MACHINE—H. Breckenridge, Lynden, Wash.
607,733.—CURRYCOMB—J. Carden, Carpinteria, Cal.
607,656.—COOKING APPARATUS—F. A. Dixon, San Jose, Cal.
607,658.—BICYCLE GEAR—D. W. Guile, Portland, Ogn.
607,619.—WASHING MACHINE—F. L. Johnson, Valley Springs, Cal.
607,515.—DISH CLEANER—Leonard & Hescoc, Tacoma, Wash.
607,661.—BEER BARREL—R. Piotrowski, S. F.
607,557.—FRICTION CLUTCH—E. Turney, Portland, Ogn.
29,053.—FLAG DESIGN—J. M. Kennedy, Los Angeles, Cal.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

BEER BARREL.—R. Piotrowski, San Francisco, Cal. No. 607,661. Dated July 19, 1898. This invention relates to improvements in barrels and kegs such as are employed to contain beer and other effervescent liquids under pressure. It consists essentially of composite heads made of disks of steel and wood placed together, fitting into the grooves of the keg and having a bolt and nut whereby the two parts are drawn together at the center with an elastic tension, so as to make the meeting edges hermetically tight. Through one side of the head thus made is introduced a bushing of any suitable character for the reception of the faucet by which the contents are withdrawn.

AUTOMATIC COOKING APPARATUS FOR CANNERIES.—F. A. Dixon, San Jose, Cal. No. 307,656. Dated July 19, 1898. The object of this invention is to provide a means for mechanically transferring the prepared cans, automatically submerging them first into a tank known as the "exhauster," in which the air is expelled, removing them from this tank until the vents are sealed, then submerging them by continuous operation into the final cooking tank, and regulating the time during which the cans are submerged in the first and in the second tank without changing the speed of the carrier, and in providing a rapid and convenient means for removing and discharging the cans after the operation is completed. The tanks are arranged in line with each other, and the pans in which the cans are contained are suspended from tracks above by trolley wheels adapted to travel on these tracks. The tracks are disposed one above the other, the upper ones serving to suspend the pans above the tanks and a switch track connection is so arranged that the trolleys are transferred to the lower tracks so as to submerge the pans in the tanks for the desired length of time, and then to again raise them out of the tank.

To Measure Flowing Water.

ase answer through the columns of next's issue how a gauge may be made for measuring water pumped from an irrigating pump!

ase advise me what a miner's inch of water irrigation purposes is. I had understood it was quantity of water which will pass through opening 1 inch square under a pressure of 4 a." Enclosed cutting from a late issue of a paper gives a different definition. Which is it?

the courtesy of the Pelton Water el Co., 121 Main St., San Francisco, we with reproduce from the 6th edition of

The lower edge of the aperture should be 2 inches above the bottom of the measuring box and the plank 5 inches high above the aperture, thus making a 6-inch head above the center of the stream. Each square inch of this opening represents a miner's inch, which is equal to a flow of 1½ cubic feet per minute.

Place a board or plank in the stream, as shown in the drawing, at some point where a pond will form above. The length of the notch in the dam should be from two to four times its depth for small quantities and longer for large quantities. The edges of the notch should be bevelled toward the

EXPLANATION OF MINERS' INCH MEASUREMENT.

catalogue cuts and description of rs' inch measurement, for measuring water of a stream by a weir dam and table by which the flow can be inter- d into cubic feet per minute. There so given a table for measurement of r flowing from a tank at varying pres- . These, it is believed, will answer uestions asked.

e term miners' inch is a method of urement adopted by the various ditch

intake side as shown. The overfall below the notch should not be less than twice its depth—that is, 12 inches if the notch is 6 inches deep, and so on.

In the pond about 6 feet above the dam drive a stake, and then obstruct the water until it rises precisely to the bottom of the notch and mark the stake at this level. Then complete the dam so as to cause all the water to flow through the notch, and, after time for the water to settle, mark the

EXPLANATION OF WEIR DAM MEASUREMENT.

panies in disposing of water to their omers. The term is more or less indefi- for the reason that the water compa- do not all use the same head above the er of the aperture, and the inch varies 1.36 to 1.73 cubic feet per minute ; but the most common measurement through an aperture 2 inches high and ever length is required and through a k 1½ inches thick, as shown in cut.

stake again for this new level. If prefer- ed, the stake can be driven with its top precisely level with the bottom of the notch and the depth of the water be measured with a rule after the water is flowing freely, but the marks are preferable in most cases. The stake can then be with- drawn and the distance between the marks is the theoretical depth of flow correspond- ing to the quantities in the table.

TABLE FOR WEIR MEASUREMENT.

Giving Cubic Feet of Water per minute, that will flow over a Weir one inch wide and from ⅛ to 20⅞ inches deep.

| INCHES. | 1/8 | 1/4 | 3/8 | 1/2 | 5/8 | 3/4 | 7/8 |
|---------|-------|-------|-------|-------|-------|-------|-------|

| 9 | 10.80 | 11.02 | 11.25 | 11.48 | 11.71 | 11.94 | 12.41 |
| 10 | 12.64 | 12.88 | 13.12 | 13.36 | 13.60 | 13.85 | 14.34 |
| 11 | 14.59 | 14.84 | 15.09 | 15.34 | 15.59 | 15.85 | 16.36 |
| 12 | 16.62 | 16.88 | 17.15 | 17.41 | 17.67 | 17.94 | 18.47 |
| 13 | 18.74 | 19.01 | 19.29 | 19.56 | 19.84 | 20.11 | 20.67 |
| 14 | 20.95 | 21.23 | 21.51 | 21.80 | 22.08 | 22.37 | 22.94 |
| 15 | 23.23 | 23.52 | 23.82 | 24.11 | 24.40 | 24.70 | 25.30 |
| 16 | 25.60 | 25.90 | 26.20 | 26.50 | 26.80 | 27.11 | 27.72 |
| 17 | 28.03 | 28.34 | 28.65 | 28.97 | 29.28 | 29.59 | 30.22 |
| 18 | 30.54 | 30.86 | 31.18 | 31.50 | 31.82 | 32.15 | 32.80 |
| 19 | 33.12 | 33.45 | 33.78 | 34.11 | 34.44 | 34.77 | 35.44 |
| 20 | 35.77 | 36.11 | 36.45 | 36.78 | 37.12 | 37.46 | 38.15 |

Example Showing the Application of the above Table.

Suppose the Weir to be 66 inches long, and the depth of water on it to be 11⅝ inches. Follow down the left left hand column of the figures in the table until you come to 11 inches. Then run across the table on a line with the 11, until under ⅝ on top line and you will find 15.85. This multiplied by 66, the length of Weir, gives 1046.10, the number of cubic feet of water passing per minute.

TABLE FOR TANK MEASUREMENT.

Giving the number of Cubic Feet of water discharged per minute, through an orifice one inch square, under any Head of Water from 3 to 72 inches.

| HEADS IN INCHES. | Cubic Feet Disch'd per minute. | HEADS IN INCHES. | Cubic feet Discharged per minute. | HEADS IN INCHES. | Cubic feet Disch'd per minute | HEADS IN INCHES. | Cubic feet Discharged per minute. | HEADS IN INCHES. | Cubic feet Disch'd per minute. |
|------------------|--------------------------------|------------------|-----------------------------------|------------------|-------------------------------|------------------|-----------------------------------|------------------|--------------------------------|
| 3 | 1.12 | 17 | 2.51 | 31 | 3.36 | 45 | 4.05 | 59 | 4.63 |
| 4 | 1.27 | 18 | 2.58 | 32 | 3.41 | 46 | 4.09 | 60 | 4.65 |
| 5 | 1.40 | 19 | 2.64 | 33 | 3.47 | 47 | 4.12 | 61 | 4.72 |
| 6 | 1.52 | 20 | 2.71 | 34 | 3.52 | 48 | 4.18 | 62 | 4.74 |
| 7 | 1.64 | 21 | 2.78 | 35 | 3.57 | 49 | 4.21 | 63 | 4.78 |
| 8 | 1.75 | 22 | 2.84 | 36 | 3.62 | 50 | 4.27 | 64 | 4.81 |
| 9 | 1.84 | 23 | 2.90 | 37 | 3.67 | 51 | 4.30 | 65 | 4.85 |
| 10 | 1.94 | 24 | 2.97 | 38 | 3.72 | 52 | 4.34 | 66 | 4.89 |
| 11 | 2.03 | 25 | 3.03 | 39 | 3.77 | 53 | 4.39 | 67 | 4.92 |
| 12 | 2.12 | 26 | 3.08 | 40 | 3.81 | 54 | 4.42 | 68 | 4.97 |
| 13 | 2.20 | 27 | 3.14 | 41 | 3.86 | 55 | 4.46 | 69 | 5.00 |
| 14 | 2.28 | 28 | 3.20 | 42 | 3.91 | 56 | 4.52 | 70 | 5.03 |
| 15 | 2.36 | 29 | 3.25 | 43 | 3.95 | 57 | 4.55 | 71 | 5.07 |
| 16 | 2.43 | 30 | 3.31 | 44 | 4.00 | 58 | 4.58 | 72 | 5.09 |

Example Showing the Application of the above Table.

Suppose the opening to be 36 inches long and two inches high, and the head of water above the opening 25 inches. Multiply the length 36 by 2, the height of the opening, and it gives 72. Referring to the above table opposite 25 inch head will be found 3.03. This multiplied by 72 gives 218.16 the number of cubic feet of water passing through the opening per minute.

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.

30in. x 72in.
Direct Acting
Hoisting
Engine

BUILT FOR THE

Anaconda
Copper Mining
Company

OF MONTANA.

Embodying all that
experience and
practical working
have demonstrated
as valuable in this
class of machinery.

The brakes, clutches and reversing gear are arranged to be operated by compressed air or steam, by means of auxiliary cylinders which are under full control of the engineer, stationed upon the elevated platform shown, insuring the most rapid work with absolute safety. Shaft hollow forged steel of ample strength and stiffness to withstand any strains; reciprocating parts of steel and are as light as consistent with the duty required; cylinders of the "overhung" type, weight being taken by a guide saddle, which admits of free longitudinal movement, due to expansion, causing no strain on bed plate or foundations; cylinders steam-jacketed, fitted with valves provided with Corliss releasing gear and hand cut-off, enabling the engines to be run economically with reference to the work to be performed; bed plates modification of the Porter Allen type, heavy and substantial, with large foundation base and anchor bolts. A duplicate of this engine has also been furnished the Homestake Mining Company of Dakota.

THE COLORADO IRON WORKS CO., DENVER, COLO.

Established 1860. ENGINEERS AND MANUFACTURERS OF

Ore Milling and Smelting Equipments.

We beg to call attention to our

High Speed Special Rolls

as being the most efficient and the most economical machine for fine dry crushing ever placed upon the market. The rolls having

NARROW FACES and
LARGE DIAMETERS

can be fed evenly over the whole width of faces with certainty, and hence the faces or crushing surfaces are easily kept true. Descriptive pamphlet on application.

HIGH SPEED SPECIAL ROLLS, WITHOUT HOUSING.

Double rope tramways are acknowledged to be superior to those of the single rope type, and any one contemplating the erection of a tramway should investigate the merits of the . . .

REMEMBER! THE STATE FAIR

WILL BE HELD AT **SACRAMENTO,**

SEPTEMBER 5th TO 17th, 1898.

This Annual Exhibition Covers a Broad Field and Brings Together People That Have Many Interests.

THE INDUSTRIAL DISPLAY

Made each year in the commodious Pavilion embraces a most general assortment of the artisan's work.

NEW DEVICES IN MINING

Machinery can be shown here to an advantage, as the extensive mining region contiguous to Sacramento makes it easy of access for those interested in this character of exhibits.

PRACTICAL PUMPING PLANTS

Are needed in many sections of the State, and those interested are viewers of these displays.

MODERN MECHANISM

Of every character is placed on exhibition at the State Fair in order to take advantage of the great crowds drawn hither by the various attractions.

THE AGRICULTURIST and general farmer makes it a point to examine, not only the improved breeds of Live Stock that form an important feature of the Fair, but all improvements in machinery and labor-saving appliances.

THE MERCHANTS of the interior of the State, the genuine distributor of wares of every description, attends the State Fair, to note the progress in all lines of trade.

THE MANUFACTURERS and their representatives cannot afford to ignore the Annual State Fair as a medium to advertise their output of goods and wares.

REMEMBER THE DATES.

Exhibits Carried free by the Southern Pacific Railroad Co.

EXCURSION RATES ON ALL RAILROADS.

THE BEST ORE CAR IN THE FIELD.

Assaying Gold AND Silver Ores.

A Standard Work.

By C. H. AARON.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores," etc.) that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:—Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of cupellation; Weighing of Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests of Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 128 12-mo pages, with illustrations, well bound in cloth, 1896. Price \$1.00 postpaid. Sold by the Mining and Scientific Press, 330 Market St., San Francisco.

THE PATENTED Locked-Coil Cables AND Webber Compression Grips BLEICHERT WIRE ROPE TRAMWAY

WHITE, ROGERS & CO., CONSTRUCTING ENGINEERS and MILLWRIGHTS, Offices: 306 PINE STREET, SAN FRANCISCO, CAL. Sole Pacific Coast Agents and Builders of the Celebrated WILFLEY CONCENTRATOR.

The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

♦ ♦ ♦ These Machines are Kept in Stock Ready for Immediate Shipment. ♦ ♦ ♦

PRICE \$450 F. O. B. SAN FRANCISCO.
One of these machines will take the place of two or three belt concentrators of any style and do very much better work.
SEND FOR CIRCULARS.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

TURBINE AND CASCADE WATER WHEEL

Adapted to all Heads from

3 Feet to 2000 Feet.

Our experience of 33 YEARS building Water Wheels enables us to suit every requirement of Water Power Plants. We guarantee satisfaction.

Send for a Pamphlet of either wheel and write full particulars.

PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & Co.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that have ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over \$5,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. For elegantly illustrated descriptive books, free, of mines in Colorado send to

from CISCO or THOMPSONS stations.

Daily stage from Thompsons to Moab—here outfit can be secured at very reasonable rates—thence by wagon or saddle to LA SAL MOUNTAINS, twenty miles distant.
The formation is igneous and all the metamorphic rocks abound. Veins of quartz, quartzite, porphyry, granite and spar are well defined. The district promises a great future.

Assaying.—Part I—Gold and Silver Ores.

Third edition; Just Out. Rewritten and Improved by the Author, C. H. Aaron. Embraces 130 12-mo pages, with illustrations; well bound in cloth; 1896. Price, postpaid.....\$1 00

Assaying.—Parts II & III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.

Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid.....\$1 75

Prospector's Field Book and Guide.

By H. S. Osborn.....\$1 50

Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.

Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. Price, postpaid.....\$3 00

Modern Copper Smelting.

By Edward Dyer Peters, Jr. Eighth edition. Rewritten and enlarged. Profusely illustrated.....\$5 00

Practical Treatise on Hydraulic Mining.

By Aug. J. Bowie, Jr. On the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hury-gurys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. Price, postpaid.....\$5 00

Practical Hydraulics.

A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulae, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is especially applicable to the Pacific Coast. Price, postpaid, \$2

The Explorer's and Assayers' Companion.

A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid.....\$5 00

The Metallurgy of Gold.

By M. Eissler. Profusely illustrated.....\$5 00

Cyanide Processes for Gold and Silver Ores.

By E. B. Wilson, E. M. 12mo., cloth.....\$1 50

Quartz Operator's Handbook.

By P. M. Randall.....\$2 00

Skeleton Mining Report.

Of great practical value to miners and mine owners in making a comprehensive report on mining properties. Useful and convenient to mining engineers as a field notebook. Price, postpaid.....50 cts.

Stamp Milling of Gold Ores.

By T. A. Rickard, M. E. An actual record of milling practice in this and other countries. Deals with the erection and management of mills, and contains many helpful suggestions to those interested in the extraction of gold from its ores. Well illustrated. Cloth. Price, postpaid.....\$2 50

Miners' Pocketbook.

A reference book for miners, mine surveyors, geologists, mineralogists, millmen, assayers and metallurgists. By C. G. Warnford Lock. 472 pages, illustrated, flexible leather.....\$5 00

Manual of Mining.

For the use of Mining Engineers and Technical Schools. Treating of Preparatory and Exploratory Work, Methods of Mining, Hoisting Machinery, Pumping, Ventilation Shafts, Tunnels, Blasting, Timbering, etc., etc. By Prof. Magnus C. Ihlseng, E. M., Ph. D. Third, revised and enlarged, edition. 549 pages, 8vo., cloth.....\$4 00

The Lixivation of Silver Ores with Hyposulphite Solutions.

With special reference to the Russell Process. Second edition. Completely revised. By Carl A. Stetefeldt. Price, bound in cloth.....\$5 00

Market Reports.

The Markets.

SAN FRANCISCO, July 28, 1898.

SILVER.—London, 27½d; New York, 58¾; San Francisco, 58¾, nominal. Bradstreet's reports: "The only feature of the London silver market was the renewal toward the end of the week of Spanish purchases. They are, however, cautiously conducted, with an evident purpose of avoiding any decided marking up of quotations. The figures for bars were, however, fractionally higher under this influence." Mexican dollars, 45½. New York exchange, telegraphic, 17½.

COPPER.—Lake, unchanged, 11.50. New York advices are that the market is firm at 11½c for Lake, with sales this week of several hundred thousand pounds thereat for delivery in August and September. Outside of the Calumet business reported, there are aggregate sales of fully 1,500,000 pounds at 11½c to domestic manufacturers. The market closes firm at this price, at which copper has been readily taken by large consumers.

LEAD.—New York, 3.90 asked; smelters quote 3.85; local, pipe, 6@6¼; sheet, 6¼@7c; pig, 5½c.

IRON.—American, soft, \$20 and \$22 per ton; Scotch, \$23.

SPELTER.—5 and 5½.

TIN.—Menlo Roofing, redipped, \$7; English, to arrive, \$4.50; Pig, 18c.

ANTIMONY.—9½, 10.

BABBITT METAL.—16c.

NAILS.—List per keg: No. 20 to 60d, wire, \$2.25; cut, \$2.00; 10 to 20d, wire, \$2.30; cut, \$2.05; 8d, wire, \$2.35; cut, \$2.10; 6 and 7d, wire, \$2.45; cut, \$2.20; 4 and 5d, wire, \$2.55; cut, \$2.30; 3d, wire, \$2.70; cut, \$2.45; 2d, wire, \$2.95; cut, \$2.70. In carload lots, 10c per keg less.

QUICKSILVER.—Domestic, \$42.50@43; export and carload lots, special rates.

POWDER.—F. O. B., San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1* 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2 per keg.

FUSE.—Triple tape, \$5.10 per 1000 feet; double tape, \$4.35; single tape, \$3.45; Hemp, \$3; Cement No. 2, \$4.35; Cement No. 1, \$3.45.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9.

COAL.—San Francisco coast, yard prices: Wellington, \$8 @ Coos Bay, \$5.00; Seattle, 6.00; Southfield, 7.50.

Cargo lots, Eastern and foreign:
Wailend, \$7.50 @ Cannel, \$10.25
Brymbo, \$7.50 @ Cannel, \$10.00
Pennsylvania, 14.00 @ Welsh Anthracite, 12.50
Scotch, 8.00 @ Rock Springs, 7.60

COKE.—Foreign, \$13; domestic, \$11 per ton.

CHEMICALS.—Cyanide of potassium, jobbing, 31 @ 32c per lb.; carloads, 25½c; sulphuric acid, 2½c per lb. for 60%; nitric acid, 12½c; soda ash, \$1.60 per 100 lbs. 58%; hyposulphite of soda, 2½c per lb.; blue vitriol, 4½c per lb.; borax, refined, 5@6c per lb.; chlorate of potash, 9¼@10c; roll sulphur, 2½c; blue vitriol, 4c.

LUMBER.—Retail: Pine, ordinary sizes, \$17@18.50; redwood, No. 1, \$18@20; No. 2, \$16@18.

The following list of Washington Government decisions relative to the new stamp tax law was given out by Collector Lynch to-day:

A 2-cent stamp is required on an order for cash drawn on a merchant by one of his customers. Certificates of deposits drawing interest, if left a certain time, are taxable the same as promissory notes.

If papers in the nature of receipts are given in lieu of checks and are used as commercial negotiable instruments, they are checks, and not receipts, and are subject to tax.

Where certificates of stock are delivered as collateral, the stock to be forfeited on condition of failure to pay the debt for which it is pledged, a stamp is required as a pledge and not as a sale.

Real estate mortgage notes require to be stamped in addition to the stamps placed on the mortgage.

Where there is a pledge of property accompanying any promissory note, which pledge is subject to stamp tax under schedule A, this stamp tax must be paid, notwithstanding the fact that a stamp is also required on the note connected with it.

In cases of loans on real estate where promissory notes are given, which are not paid at maturity, but on which an extension of time of payment is granted without the taking of a new note, it is held that every such extension is a renewal of the note within the meaning of the statute, and that the requisite stamp must be affixed for every such renewal or extension. This also applies to notes discounted before July 1, falling due on or after that date.

The person who signs and issues a bank check without affixing the proper stamp becomes involved in liability to penalties under section 10 of the act, unless it is shown that he had no design to evade the payment of the stamp tax, and that the requisite stamp was affixed and canceled by the bank or person upon whom it was drawn before payment.

When certificate of stock is sold and stamp tax is paid on memorandum thereof, upon transfer of this certificate to purchaser's name, no additional tax for such transfer is required. Where one certificate represents several shares of stock (however large the number of shares) on the transfer of this certificate the stamp tax is to be reckoned on its face value and not on the face value of each separate share of stock which it represents.

Immense amounts in the aggregate are now being received by the Government by the operation of the stamp tax. Conquest, expansion, "imperialism," annexation, etc., come high, but

we advance and must pay the first cost. The nation moves on. First, we crossed the Alleghenies, then subdued the plains, then crossed the Rockies, then the Sierras. Now even the Pacific ocean does not stop the steps of manifest destiny.

Mining Share Market.

SAN FRANCISCO, July 28, 1898.

Little in the way of business has been done during the week. On Monday all stock dealing began on the plan of certificates, calling for future delivery of shares at the par value to which stockholder's meetings will reduce them next September, which gave a little life, though, of course, nothing like activity could be expected under present conditions at the mines.

The Governing Committee of the Colorado Springs Mining Stock Association held a meeting Friday and passed a measure which will do away with the 25-cent stamp tax for power of attorney, says the Denver News. The measure has received the favorable opinion of a number of leading law firms. The manner in which they propose to do away with this tax is by the adoption by each company as a by-law to this effect:

"All transfers of the stock of the company shall be made by assignment of the certificate representing the same duly signed by the person in whose name such certificate was issued, and all such transfers shall be entered and registered by the secretary in a book kept for that purpose, but only upon the surrender of such certificate duly assigned as aforesaid. No transfers shall be complete until such assignment, surrender, entry and registration, and all surrendered certificates shall be canceled and placed on file by the secretary."

The Con. Cal. & Va. and Andes proposes in September to reduce share values to \$2.50, Chollar, Occidental, Mexican, Crown Point, Yellow Jacket, Belcher, Confidence, Challenge Con. and Caledonia, \$3, Julia and Con. Imperial \$1.

Working Capital for Mines.

PACIFIC EXPLORATION COMPANY

Will form companies and find capital to develop mines on shares or commission. Miners who have a good prospect should write the manager of this company for particulars. Address W. E. HOLBROOK, Manager, 29-30 Chronicle Building, S. F.

Commercial Paragraphs.

At Houghton, Mich., the E. P. Allis Co. of Milwaukee has secured the contract for the machinery of the new Franklin mill, to include five stamps and a 15,000,000-gallon pump. Mill building will be of steel and is to be ready July 1, 1899. The Allis Co. has taken orders for over \$100,000 worth of machinery in Houghton county in ten days.

The Union Gas Engine Co. of this city has just completed a 50-H. P. oil marine engine to be placed in the schooner Queen of the Isles this week. Also a 4-H. P. motor of the same type for a landing launch to accompany the schooner. These engines will be operated by kerosene oil of 150 degrees fire test, being the first engines built to work on oil of this high grade. The Queen of the Isles will trade among the Caroline Islands, and is regarded as the pioneer of a large fleet of the same class that will soon ply among the islands of the South Pacific.

One of the largest and best equipped power buildings in the United States in the Manufacturers' building, Providence, R. I. This building has accommodations for upwards of sixty manufacturing concerns, being particularly equipped with conveniences for the production of jewelry, specialties, etc. The Manufacturers Building Company has purchased a 250 K. W., 500-volt Westinghouse Electric & Mfg. Co.'s engine type generator, 100 r. p. m., to be driven by a Corliss engine. This generator will supply power for the operation of motors in the various manufacturing departments of the building.

Mr. W. J. MILLER, General Manager of the Denver Engineering Works, has lately returned from a trip to Europe, where he went to examine some improved electrical mining machinery not being used in this country, but used very extensively in the mines in Hungary. The Denver Engineering Works aim to keep up with the times, if not a little in advance, and considered it would be better to go and see this machinery working rather than get their information by mail, and possibly discover that, if the machinery is capable of producing good work in Europe, it would not work so well in this country. Mr. Miller made arrangements for his company for the introduction of these improvements in this country, which, if successful, will reduce the cost of mining very materially.

Catalogues Received.

Denver Engineering Works Co., Denver, Colo., Catalogue No. 6, electric and steam hoisting plants; elaborately illustrated; dimensions, descriptions and prices, with tables and required information in detail.

Thomson Electric Welding Co., Lynn, Mass.; illustrated description of apparatus for forging, brazing, welding, tempering, etc., by electricity.

The American Stoker Co., New York; handsome pamphlet of their underfeed stoker, with results of tests, testimonials, etc.

Baldwin Locomotive Works, Philadelphia; illustrations and specifications of work recently turned out for foreign use, with records of construction, etc.

Dearborn Drug and Chemical Works, Chicago; an excellent treatise on lubricating oils for engines and machinery, and the proper treatment of boiler feed water to prevent the formation of scale, with explicit directions as to how to send samples of feed water for analysis, and practical points about the selection of lubricants.

DEWEY, STRONG & Co.,

PATENT SOLICITORS,

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY, STRONG & CO., Patent Agents, 330 Market St., San Francisco, Cal.

AN ASSAYER AND CHEMIST of long experience, who is also an Amalgamator and Practical Millman, desires a position with a mining company. Address W., care of Mining and Scientific Press.

WANTED.—Position as Manager of Gold Mine or Mill. Have had ten years' experience in mining and milling free and base gold ores and thoroughly understand all departments. References. Address Z, Mining and Scientific Press.

WANTED.

Partner in Extensive Placer and Quartz Mines. Free wood and water. JAMES ARTHUR, Cornucopia, Union Co., Oregon.

Experienced Chemist, Assayer and Cyanide Operator

DESIRES ENGAGEMENT.

Has had charge of cyanide plant where segregated slime and slimy material have been worked to high percentage of gold value at small cost. References. Address P. K., this office.

FOR SALE.

5-Stamp Quartz Mill, Shafting, Pulleys and Belting, 25 H. P. Engine and Boiler, Hoist, Pump, Steam Pipe and Fittings, Blacksmith, Carpenter and Mining Tools. Located near San Andreas, Cal. Enquire of DR. W. G. WALLACE, 638 Sutter St., San Francisco.

A GOLD MINE

Seven Miles from R. R. 10 to 15-Foot Vein of Soft Ore, \$7 to \$8 Per Ton.

A half interest will be given to a responsible person for some development and a mill that will successfully treat the ore.

Assessment Notices.

MARGUERITE GOLD MINING AND MILLING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Auburn, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 20th day of June, 1898, an assessment (No. 10) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 237 13th street, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the 4th day of August, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 4th day of September, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors.

Office—237 13th street, San Francisco, California. The Secretary will also receive payments from 12 to 5 P. M. at his business office, 225 Sansome street.

RED CAP MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Red Cap Creek, Humboldt County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 20th day of June, 1898, an assessment (No. 4) of Two Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, room 14, Nevada block, 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 5th day of August, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 20th day of August, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors.

WILLIAM McPHERSON, Secretary. Office—Room 14, Nevada block, No. 309 Montgomery street, San Francisco, California.

GOULD & CURRY SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 7th day of July, 1898, an assessment (No. 84) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, room 49, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of August, 1898, shall be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 20th day of August, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors.

A. L. ELLIOT, Secretary. Office—Room 49, Nevada block, No. 309 Montgomery street, San Francisco, California.

LEON GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, near Winchester, Riverside County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 10th day of May, 1898, an assessment (No. 1) of 1 1/2 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 7, 5th floor, Mills building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 30th day of June, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 25th day of July, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors.

R. L. CHENEY, Secretary. Office—Room 7, 5th floor, Mills building, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors of the Leon Gold Mining Co., the day of delinquency of the above assessment is postponed to July 9th, 1898, and the day of sale to MONDAY, August 8th, 1898.

R. L. CHENEY, Secretary. Office—Room 7, 5th floor, Mills building, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors of the Leon Gold Mining Co., the day of delinquency of the above assessment has been postponed to August 6th, 1898, and the day of sale to MONDAY, September 5th, 1898.

R. L. CHENEY, Secretary. Office—Room 508, Safe Deposit building, Cor. California and Montgomery streets, San Francisco, Cal.

THORPE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Fourth Crossing, Calaveras County, California.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 10th day of June, 1898, an assessment (No. 10) of 2 1/2 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 44, Phelan building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 18th day of July, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 8th day of August, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors.

A. F. FREY, Secretary. Office—Room 44, Phelan building, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors of the Thorpe Mining Co., the day of delinquency of the above assessment has been postponed to August 16th, 1898, and the day of sale to WEDNESDAY, September 7th, 1898.

A. F. FREY, Secretary. Office—Room 44, Phelan building, San Francisco, California.

MARINA MARICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 9th day of July, 1898, an assessment (No. 14) of 2 cents per share was levied upon the issued capital stock of the corporation, payable immediately in United States gold coin, to the secretary at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 18th day of August, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 7th day of September, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors.

CHARLES BOVONE, Secretary. Office—217 Sacramento street, San Francisco, California.

ROSE CREEK MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 27th day of July, 1898, an assessment (No. 2) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, room 163, Crocker building, Post and Montgomery streets, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 3rd day of September, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 26th day of September, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors.

J. M. WILMANS, Secretary. Office—Room 163, Crocker building, Post and Montgomery streets, San Francisco, California.

BOULDER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 27th day of July, 1898, an assessment (No. 1) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 163, Crocker building, Post and Montgomery streets, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 2d day of September, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 26th day of September, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors.

PRESCOTT, ARIZ., February 26, 1898.

Canton Steel Co., Canton, Ohio.

GENTLEMEN:—I have sold Canton Drift Steel for the past ten years—in fact, I introduced it into this district. At that time Jessop's steel was largely used and there was a strong prejudice against the introduction of any new make of steel. The best evidence of the merits of Canton Steel is that it has entirely driven out Jessop's steel.

as well as almost every other make of steel.

A guarantee has always been given, that if not giving satisfaction or proving defective, money will be refunded. In all these years I have not had a single bar returned.

Its adoption and use by almost all mines of this district, is certainly evidence as to the unequaled merits of Canton Steel.

Yours very truly,

SAMUEL HILL,
Hardware and General Mining Supplies.

THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.

It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

J. S. BROWNELL, ESQ.—DEAR SIR: Replying to your query of Feb. 15th, will say that I have used your Patent Lip flange belt more than one year, and judging from their appearance after more than one year of hard service, I do not hesitate to say that they are the best belt I have ever used and I take great pleasure in testifying to the fact.

MR. J. S. BROWNELL—DEAR SIR: I take pleasure in saying that I have used your Patent Lipped flange belt for several years while connected with this company, and I consider them the best that we have used. The quality of rubber in the flange seems to be the best, and we are not bothered with the flange cracking and thereby destroying the life of the belt. At present we are using 14 concentrators, and have in use several kinds of belts. We consider your Patent Lipped flange the best.

Vertical Duplex Gas Engine.

In England is now built a gas engine which departs from the normal design. Two pairs of these gas engines, manufactured by the Griffin Engineering Co., were recently installed in a warehouse in London for driving dynamos to light the warehouse. Each engine drives one generator through a countershaft, the plant being so arranged that either engine can be coupled to either machine. The most striking peculiarity of the engine is that it is vertical and that the cylinders are supported on four massive steel pillars. This is not the first vertical gas engine built, but previous ones have been much smaller. These engines at 180 revolutions each give 46 I. H. P. and 40 brake H. P. The vertical design seems well adapted to this engine, as the heavy and sudden

upper end of a vertical shaft operates both sets of valves. Inlet and exhaust valves open direct into each cylinder, being operated by ordinary levers from the cam. The ignition of the charge is effected by two incandescent tubes arranged side by side in one chimney and heated by a single Bunsen flame, a single gas valve supplying both cylinders. It is controlled by a hit-and-miss device operated by a centrifugal governor. It will be noted that the combustion chamber and passages are entirely water-jacketed. The dimensions of the cylinder are: Diameter, 10½"; stroke, 15". The consumption of

respecting value, but that when they appear in the English market, through a "prospectus" and an incorporated Co., Limited, with earls, lords, etc., directors, with figures for shares \$40 to \$1 to be paid for the property, and all so grandly gilded, that the poor mining proprietor becomes convinced that he has been foolish in letting go so cheaply a property estimated by others to have so enormous a value. Of course, most of us understand how it is, but lately it has become clear that the English public is waking up to the existence of an evil: the selling of position and influence for coin.

The Hooley expose makes clear the causes and requirements for all the loading-up of mining and other properties when put on the London market. Ordinarily, so many have to be cared for in any English operation, that to cover all a figure is put on

FIG. 2.

FIG. 1.

NEW VERTICAL DUPLEX GAS ENGINE.

FIG. 3.

strains to which it is subjected are met by placing the cylinders on the pillars. There is a noticeable absence of vibration, and it is not so easy to distinguish between explosion strokes and non-explosion strokes, as is usually the case with horizontal engines. The saving of space was in this instance also an important matter.

Fig. 2 shows a second feature of novelty—the duplex arrangement of the cylinders—there being two cylinders, but only one connecting rod. It will be noticed that the two cylinders are combined in a single water jacket and that the two pistons are coupled together by a steel cross-head. The trunk pistons are very long and work each in its own cylinder for its entire length. The inner sides of the cylinders, where they form guides, are cut away to allow the cross-head to pass. Each piston is bolted to the cross-head by four bolts, and in addition there is a central bolt passing through the entire length of the piston. The engine works on the four-stroke cycle, there being an explosion at each stroke in one or the other of the cylinders. A single cam on the

gas is said to be 18½ cubic feet per I. H. P. and 21½ cubic feet per brake H. P. Since the engines have to make long runs without stoppage, special pains were taken to render the lubrication continuous and reliable, and the engines run steady, satisfactory lighting by incandescent lamps down to quarter load.

London Stock Jobbing Sharps.

Some months ago a great deal was said in London journals about the way the English people were "swindled" by California mining sharps; in one instance it was stated that all Englishmen should think twice before they invested a shilling in any American mining property. At the time the matter was noted herein, one communication on the subject saying "if the English would look very closely they would find, no doubt, several Englishmen 'under the fence' somewhere," and that they were the fellows who loaded the mines upon their countrymen. It is well known by everyone handling mines on the English market that properties leave California under bond, at fair, profitable and honest figures,

mining property that makes a sale too often a failure, which otherwise should have been a success. This latest expose should make a radical change in all this business of English promotion. Everyone is willing to accord a legitimate profit for the trouble of finding good mines, and preparing them for sale, and to the English agent for his business efforts; but it is a curse to American mining interests to demand in London \$1,000,000, or possibly \$2,500,000, for a property negotiated in California or elsewhere for from \$50,000 to \$300,000. There is neither sense, honesty or business in such work, and the sooner it is ruled out the better. An owner who desires to make success of a sale should determine upon his price, allow the promoter a reasonable advance to pay him for his trouble and business service, then demand in writing that no additional loading, under any circumstances, shall be put upon that price. This would enhance the likelihood of a sale. The English buyer would thus have value received for his money and the American mine owner and promoter would be credited with fair dealing.

A PAPER recently read before the Colorado Miners' Bureau on "Gold Yield of Placer Mines" brings out some noticeable statistics coinciding with some former statements in this paper regarding the large percentage of the world's gold yield produced from placer mines. The paper referred to goes further and claims that more than eighty per cent of the world's supply of gold has been taken from placer ground. Some definite statistics were furnished, compiled from official reports, which tended to corroborate the claim. In those reports Russia is credited with an annual placer production of gold amounting to \$20,000,000. Some of the figures seem to be exaggerated: for instance, Africa appears as having yielded a total of \$553,000,000 in placer gold; Japan, \$500,000,000; Australia, \$1,250,000,000; New Granada, \$847,113,750; Peru, \$124,000,000; Bolivia, \$205,000,000; Brazil, \$500,000; California, \$1,200,000. The present Klondike gold yield will tend to further augment the percentage of the world's gold yield from placer mines. And yet the enormous aggregate is but an index of the possibilities in that direction.

THE one unanswerable argument in favor of the profitable nature of gold mining as a business is the increased value of the product, the only product of any industry that shows such increase. True, it is not called an increase, but the fact is manifest. Everything connected with its production has increased in convenience and utility, but decreased in price. Mining supplies of all kinds are furnished cheaper and better: \$25 to-day will buy what cost \$100 twenty-five years ago; cost of reduction has been reduced; labor is obtainable at lower rate; yet, contrary to the rigid rule in every other business instance, the product sells for the same price it did when the attendant cost of production was three or four times what it is now—\$20.67 per ounce. It would be interesting to give tabulated statements of cost—now, and say twenty-five years ago; giant powder then \$1 per pound, now of vastly better quality, 15 cents; candles, \$20 per case, now \$5; fuse \$30 per 1000 feet, now \$4.50; iron 20 cents, now 5 cents; steel 40 cents, now 8 cents; tools of all kinds in like proportion. Nor is this all. In all other products the producer seeks the customer, the buyer, the consumer. In all other products "overproduction," "want of consumption," business rivalry, competition, ruinous cutting of prices and other attendant annoyances embarrass the producer. In the case of the gold miner, he is saved all these troubles. In nearly every other line of human industry the question of freights enters largely into the problem; upon the ability of the producer to get the product to market often depends success or failure of the entire enterprise. In the case of the gold miner freight charges are reduced to the minimum. These are a few of the unusual circumstances attendant upon the business of gold mining and sufficiently illustrate the point.

The Usual Result.

Most instructive in "financial methods" is the publicity now accorded "the Electrolytic Marine Salts Co." in Eastern prints. This concern some time ago announced its ability to profitably extract gold from salt water at its "works" at North Lubec, Maine. At the time reference was made herein to recent scientific investigation, tending to further confirm that which is generally understood, viz.: that while gold undoubtedly exists in sea water, it has hitherto been unprofitable to attempt its separation therefrom, the amount being less than $\frac{1}{4}$ of 1 grain to the ton of water. The opinion was also expressed that the first part of the coupled fact might be successfully used in inducing ignorant people to invest in a proposition to form an extraction company, which to investors would prove as fruitless as a similar one to extract sunbeams from cucumbers. The result is in accordance with our belief.

Boston financial papers (of course, wholly uninfluenced financially; purely in the interest of science), during June and July contained most glowing accounts of the enormous resultant profits on the stock of this company: the likelihood of a sudden rise in the price of the stock, intimation that by proper effort a few shares could still be secured, and further innocent statement that some knowing ones who applied for blocks of the stock had to be content with a "pro rata," and were congratulating themselves on getting even a very small slice of this very valuable stock.

Indeed, had such editorial articles appeared in London financial journals it would be uncharitably assumed that they were paid for at so much, so very much, per line to induce foolish people believing such absurdities to buy stock.

That those articles had such effect is evident. In the issue of July 29th of one of the Boston papers, most fulsome in its former editorial statements, is expressed serious concern regarding the present whereabouts of the "reverend" inventor and custodian of the secret, who, it says, "has this year realized from confiding New England investors more than \$1,000,000, of which \$338,378 was paid to him personally." It appears that this gentleman has suddenly and silently withdrawn, and it is feared in Boston editorial offices that much of the money paid him has accompanied him in his departure. The fact that some of his remaining associates declare in this same issue of the Boston paper of July 29th their willingness to "stake their lives on the success of the business" does not tend to remove painful apprehension among people who, according to this Boston paper, have "mortgaged their houses and reduced their living to put money into this company." Just how much influence the former meretricious editorial announcements had to do with inducing those misguided people to put their money into the scheme is something that is indeterminate. It is a pity that the lashing now being administered the "reverend" projector by the astute Boston press was not forthcoming when he first induced those immaculate publications to print the statements that lured the victims into his cleverly constructed net.

HITHERTO, amid the fraud, falsehood and trickery so prominent in nearly everything connected with the Klondike, the Canadian officials have enjoyed honorable place. But if half what is charged by recent arrivals be so, they, also, deserve condemnation. With considerable show of truth, it is asserted by men from the Klondike that, by illegality and injustice, Canadian officials have created a monopoly, and that they are devoid of honesty and integrity. One honorable exception is made—Capt. Constantine. The extortionate taxes and duties may be borne, natural friction and difference may be overlooked, but malfeasance and abuse of position are charged to so great an extent that the officials under so grave an imputation should have an investigation. As between mining claimants in that region the Gold Commissioner's decision is final. This is asserted to be a temptation not wholly withstood by the incumbent. By collusion, it is also claimed, those "on the inside" become possessed of the best claims. This is given as a sample case:

"A man reports the discovery of gold on a new creek; he tells what he has found, gives its location and description, and asks for papers. He is told that the 'inspector' will go out and examine the prop-

erty to see if he has really found gold—if he has not he is not entitled, under the law, to locate. Several days elapse before the inspector can go out, insiders are told to go and locate above and below the discovery hole, 'and you needn't see any other stakes that may be there!' It usually happens that there were several men with the real discoverer on the prospecting tour, and, as soon as a find is made, they all locate above and below. By the time the inspector gets to the spot there are two sets of stakes above and below 'discovery,' one set belonging to the companions of the real discoverer, and one set placed there by those to whom the 'tip' is given. The inspector does his work and reports, and the discoverer is given his papers. As the discovery must be officially recognized before any other papers can be had on the creek, of course applications for the adjoining claims cannot be recognized until after the discovery is allowed. So when the friends and fellow-prospectors of the real discoverer make their application they are too late; 'papers were applied for and granted to that property an hour ago.' There is no appeal, what is there to be done about it? Then it naturally follows that if the inspector's report is a very good one, and it usually is, there is a stampede, and the property becomes saleable at once. The insiders sell—if they are told to do so—the proper settlement is made, and the insiders wait for another 'tip.'"

Recalcitrant Ownership.

From Los Angeles, Cal., Telluride, Colo., and Burke, Idaho, come practically the same question. The inquiry from Los Angeles is most briefly stated, and is as follows:

A. B. and C. are equally interested in a mining claim. After assessment work is performed, A. and B. desire to continue operations and do so. Is C. liable for his share of expenses incurred—wages, mining supplies, etc.? Can C. cancel this obligation by notifying A. and B. that he will not be responsible for further expenses, and how will he proceed in the matter?

C. is not liable unless working under a mining partnership or by agreement. As stated above, C. can quit whenever he wants to and cannot be made to pay any part of the expenses or stand any share of the loss, though, under the law, if the prospect turns out well and becomes valuable he can claim a share in the profit. Numerous decisions are to the effect that "a co-tenant in possession of a mining claim, whether his interest be large or small, cannot bind those who do not voluntarily participate in the venture. He cannot force direct contribution for improvements made, nor for the costs and expense of development or working." While each co-tenant has the privilege of entering upon the property and making such use of it as its nature will permit without committing destructive waste, he will not be entitled to retain for his exclusive use any more than his proportionate share of the net product. The working co-tenant may deduct from the gross product all legitimate expense of working, but in case of loss he cannot compel his co-owners to contribute.

Section 2324 Revised Statutes contains a method of ordinary forfeiture to co-owners that applies to a portion of the Burke, Idaho, letter. The section referred to, after providing for the performance of annual labor, or the making of improvements to the value of \$100 during each calendar year, contains the following additional provision:

"Upon the failure of any one of several co-owners to contribute his proportion of the expenditures required hereby, the co-owners who have performed the labor or made the improvements may, at the expiration of the year, give such delinquent co-owner personal notice in writing or notice by publication in the newspaper published nearest the claim, for at least once a week for ninety days; and if at the expiration of ninety days after such notice in writing, or by publication, such delinquent should fail or refuse to contribute his proportion of the expenditure required by this section, his interest in the claim shall become the property of his co-owners, who have made required expenditures."

With approval is noted the fact that all applications for patents now pending that were filed by employes of the Washington, D. C., patent office, during the period of their service, have been ordered stricken from the files and fees returned. This applies in every case, even when the patent was completed after the former government employe had ceased to be in that capacity. The Commissioner of Patents is to be commended for this ruling, the justice and necessity of which are manifest.

Concentrates.

PITTSBURGH, Pa., capitalists will build a pyritic smelter in Carson, Colo.

MINING company's assessment notices, etc., are legally published in weekly journals.

THE 1894 quicksilver production of the Almaden, Spain, quicksilver mine was 44,521 flasks.

THE Victoria, Australia, gold yield for the six months ending June 30th, '98, was 382,716 ounces.

THE Sierra City, N. M., reduction works refuse to establish an eight-hour system for employees.

THE total dividend disbursements of the Boston & Montana Copper Co. to date aggregate \$3,375,000.

IT is locally claimed that the Barstow, Cal., Reduction Co. pay only \$16 per ounce for "desert gold."

DENVER AND PUEBLO, COLO., smelters have made contracts for iron from the Hartsville, Wyo., mines.

AT Quesnelle Forks, B. C., the Cariboo hydraulic mine's first run of the season amounted to \$62,500.

THAT gold does exist in sea water is a fact; that, so far, it cannot be extracted with profit is also a fact.

THIRTY-FIVE railroad cars of iron and mineral are daily routed from Leadville, Colo., to the smelters.

THERE are over 12,000 tons of ore at the Trail, B. C., smelter, awaiting the starting of the works.

THE Pinos Altos G. M. Co. will build a reduction plant at Pinos Altos, N. M., of 200 tons daily capacity.

IN 1894 the ore shipments from Rossland, B. C., amounted to \$75,000; they increased last year to \$2,100,000.

THE best time to go to the Klondike is in summer; the best time to mine or travel there is in the winter.

IN twenty-one years the market price of 99% cyanide of potassium has fallen from \$1.50 per lb. to 25 cents.

TWENTY THOUSAND maps of Mercur and Tintic, Utah, are being distributed at the Omaha, Neb., exposition.

THE "lost Pegleg mine" is again found—in eastern Riverside Co., Cal., and ought to stay discovered this time.

WHILE descending a shaft in the Gloriana mine at Cripple Creek, Colo., R. E. Melvin was killed by foul air last week.

SURVEYS are being made for a line of railroad from Bingham, Utah, to the Highland Boy mine, a distance of seven miles.

AFTER a respite of eleven months, 30 of the 120 stamps on the Diamond Hill mine at Winston, Mont., have been put in operation.

THE Champion M. Co., at Nevada City, Cal., are rebuilding their reservoir again which will enable them to run their 40-stamp mill.

THE American Express mine at Blacktail, S. D., is the only one in that district paying union wages. The other mines are worked by contract.

THE Tiger-Poorman mine near Burke, Idaho, has introduced electric power and is said to be the only property using it in the Coeur d'Alenes.

AN example of a large mining claim held by one patent is the Golden Butterfly in Butte Co., Cal., consisting of 1200 acres patented land.

THE cyanide plant of the Midas M. Co., at Harrison Gulch, Cal., was destroyed by fire last week. The loss is \$1500. The plant will be rebuilt.

"CONCENTRATES" is unable to tell "when and where the first copper plate was introduced?" referring to the California quartz stamp mill.

SINCE Aug. 22, '97—less than one year—there has arrived in San Francisco from Australia \$24,187,349 in gold, all of which has been recouped here.

NEAR Whitehall, Montana, last week, J. Shea was killed by the accidental discharge of two sticks of giant powder to which caps were attached.

COMMUNICATIONS concerning public lands in southern California can receive speediest reply by being addressed to Col. B. F. Allen, Los Angeles, Cal.

THE Mount Morgan, Australia, dividend for June was 7d per share, £29,166 13s 4d—the first dividend above 6d that has been declared since June, 1891.

THE sale of the Snowshoe mine, near Libby, Mont., which has been under bond for four months to an English corporation, has been closed for \$150,000.

PLYMALE BROS. & Co., who have been experimenting with a dredger near Gold Hill, Or., have taken out their machinery, the enterprise not proving successful.

INCREASED use in the arts, and a strong demand in connection with the cyanide process, are among the causes of the advance in zinc ore from \$22 per ton to \$28.

THE Oroville, Cal., Water Co., has bought the Miocene ditch system and the Thermalito pipe line, and has under consideration the erection of an electric power plant.

THE force of the Livingston, Mont., Coal & Coke Co.'s plant at Cokedale has been increased to sixty men. The company will resume the burning of coke at an early date.

A KLONDIKE report states that J. Ladue has at last secured from the Canadian Government a crown grant for the 160 acres of land upon which the townsite of Dawson is located.

NEAR Choteau, Montana, the Mitchell Co. is building an irrigating reservoir that will cover 2100 acres. At the mouth of the reservoir a dam will be built 40 feet high.

MONTANA placer miners have been favored with plenty of water this year; the industry has received new impetus, and a large output of gold from that source is expected.

THE Congressional bill referred to last week, affecting California mineral lands already patented to the railroad, was endorsed by the California Miners' Association last January.

EVERY application for a U. S. patent to a mining claim filed since the 1st of last month must show that \$500 worth of work has been done on that claim, or for each claim if locations are grouped.

THE Dillon, Montana, Tribune, noting the revival of mining in Beaverhead county, says there will soon be more men employed in the mines there than there were in the '70's and '80's.

THERE are not more than thirty mines in California over 1000 feet in depth, and but three over 2000 feet. The Union Co., on the Comstock is 3350 feet deep; the Calumet-Hecla in Michigan is 4900 feet.

THE Josephine M. Co., operating in Josephine county, Oregon, has made an assignment. The liabilities are \$8000. The

cause of the assignment is the death of one of the company and the scarcity of water.

THE Miners' Union at Leadville, Colo., has arranged for a drilling contest Aug. 14, at which \$700 will be given in prizes, the largest being \$400.

THE Deadwood-Terry shafthouse of the Homestake M. Co., at Lead, S. D., was destroyed by fire last week; loss, \$50,000. It will be rebuilt. Three hundred men are temporarily thrown out of employment.

WORK of sinking for foundations for the proposed debris dam is reported to have been recently resumed under the auspices of the California Debris Commission at "the Narrows" near Smartsville, Yuba Co., Cal.

THE U. S. Mint never makes assays for any one. While assaying is constantly done there to determine the fineness and value of gold dust or bullion, it is only for the institution itself that such work is done.

THE fact that at present there are but forty men on the Comstock payroll as miners, would seem to unsatisfactorily solve the old problem of wages in that famous camp, which for thirty years paid \$4 per day.

THE central point of the North American continent (exclusive of islands) is at Elko, Nevada. The central geographical point in the U. S. is thirty-four miles west of the mouth of the Columbia river.

THE Kootenay country mines, B. C., from the Rocky mountains to the Yale district, produced ten years ago \$26,000; five years later the product increased to \$100,000; last year the output reached \$7,000,000.

T. S. LIPPY, who got about \$100,000 in the Yukon region this season, asserts that the American side or lower 1500 miles of the Yukon river is richer than that part of the Northwest Territory located about Dawson City.

IN 1894 the Boston & Montana Copper Co.'s dividend was \$2 per share; in 1895 it was \$7; in 1896 it rose to \$10, and in 1897 the company declared four dividends of \$3 each. The dividends declared thus far this year amount to \$11 per share.

FROM Arabia district, Humboldt county, Nevada, were recently shipped 500 pounds of phyllite, a silicate of alumina, to Cleveland and New York, to be tested by the electro-cyanide process. The result was 37 cents per ton silver and from \$3 to \$6 gold.

A VERY good coating for iron pipe, and one that will stand 250°, is a good asphalt lacquer laid on thinly. If desired to be "ornamental," zinc oxide mixed in will give a gray shade, red lead a brown. Where oil paint is used the surface should be thoroughly cleansed.

OF the \$2,000,000 gold recently received in San Francisco from the Klondike, that from different localities varied in value, the gold from El Dorado creek going about \$14 to the ounce, and from other localities of higher value, the Bonanza Creek gold going \$16.50.

THE Supreme Court of British Columbia has decided that portion of the Coal Mines Regulation Act relating to the employment of Chinese underground in mines is constitutional and that they are barred from competition with miners in the province of British Columbia.

AT present the Con. Cal. & Va. Co. of Nevada has the largest capitalization of any mining corporation in the country—\$21,600,000. When its proposed reorganization comes to pass the Minnesota Iron Co. will have that distinction, with its 160,000 shares, par value \$100.

FIGURING a Klondike output of \$15,000,000, the product of 8000 men, would give an average of \$1875 per man for the year on the invested capital of outfit and labor. There, as everywhere, every dollar taken out represents at least an equivalent of effort and expenditure.

J. OLIVER in the Silver King mine, near Nelson, B. C., entering the tunnel too soon after a shot had been fired, finding the gas too strong attempted to retrace his steps but fell, overcome with the fume; the candle in his hand set fire to his clothes and he died in a few hours.

A LATE reported ruling of the General Land Office in regard to compromising where claims conflict, is to the effect that, if a claimant has a right to a portion of the ground, he has a right to the whole of it, and has no right to compromise the case pending a decision of the Land Office.

THE Vancouver Smelter Co., of London, England, with a capital of \$750,000, has formed a combination with the Treat Smelter Co., at Vancouver, B. C. The latter has a plant of 100 tons capacity which is to be enlarged by the new company and be in operation before the end of the year.

THE "mother lode" in California is popularly supposed to extend west of north from about what was formerly Bridgeport in Mariposa Co. into El Dorado Co. The "east lode" is supposed to almost parallel it but with a more westerly trend, from six to fifteen miles eastward of the "mother lode."

ARIZONA mining interests show encouraging progress, and the gold and copper of that rich Territory are becoming factors in the world's output. Territorial augmentation is exhibited in the result of the recent annual adjustment of Presidential postmasters' salaries. Every office in Arizona except one, changed, was increased.

ON page 80 of the issue of the 23rd ult., in the article "Development of the Cyanide Process," the words "arsenic sulphides, regular and orpiment," should read "arsenic sulphides, realgar and orpiment." In the sentence beginning, "Therefore before the cyanide solution thus found," the last word should read "fouled."

THE ironclad pool of the Le Roi, B. C. Co., in which four-fifths of the stock was held, has been dissolved; the Peyton faction has sold its holdings to the British American Corporation on the basis of \$6 per share, and involves 284,000 shares; and, as the capitalization of the Le Roi is 500,000 shares, the B. A. C. now has a majority in the company.

THE MY yield of the Witwatersrand, S. A., was from the mills 221,570 ounces, from concentrates 9051 ounces, from tailings 106,797 ounces, slimes 5515 ounces, banks 927 ounces, a total of 344,160 ounces, worth \$6,058,825. The aggregate amount of profits declared by the mines of the Rand for the half year ending June 30th, '98, exceeds \$3,750,000.

WEST AUSTRALIA justly fears the probable danger to life and property occasioned by the increasing number of unskilled miners. In no pursuit is each worker more dependent upon his fellow laborers for safety than in mining, and self-interest requires as small a proportion of "green hands" as possible where any considerable number of men are employed.

"GABBERO" may be technically defined as "a granular intrusive rock, consisting, principally, of diallage or allied mono-

clinic pyroxene, or a rhombic pyroxene, together with soda lime and lime feldspars. "Gabbro-diorite" is a term indicating areas of gabbro containing primary and secondary hornblende and areas containing intimate mixtures of gabbro and diorite.

TANTALITE is composed of oxide of tantalum, iron and manganese with occasional tin and tungsten. Tantalite and columbite are not identical, though columbite is similar to tantalite, the main difference being that it contains niobium, another rare element instead of tantalum. There is not supposed to be any commercial value to these minerals except as mineralogical specimens.

GEN. MGR. CULBERTSON reports a profit of \$64,604.46 during the year ending June 30th, '98, in working the Tiger-Poorman property at Burke, Idaho. He thinks that with the new machinery now being placed, and the consequent increased output, the company can soon begin paying dividends. During the year there were mined 113,607 tons crude ore, producing 16,628 tons shipping ore.

PLATINUM in usual connection with iridosmine is found in several counties in northern and central California, likewise on the Similkameen river, B. C. So far as known, platinum in place has not been found on this continent. It is found, incidentally, in gold mining but not in matrix, only from debris of serpentine or peridotite. In the Ural mountains, Russia, it is mined for itself alone.

THE Nevada Co. has sued its agent and manager, P. T. Farnsworth, alleging that it gave him \$20,000 to buy mines, and that, in purchasing, the difference between the prices he represented as having paid and the actual disbursements was \$110,757, which they want returned. The suit is brought in Salt Lake City, Utah. Most of the purchased mining property is in Lander Co., Nevada.

THE latest alleged "salting" of a mine is reported in the Denver, Colorado, Times, wherein the purchaser was permitted to "blast out several feet" in the breast of a drift, finding good pay ore, discovering when too late, that the giant powder had been "salted." The story is a good newspaper one, and is about as truthful as the usual diaphanous one about "salting" California gold mines.

INTERIOR papers are advertising an unusually large number of applications for patent. A U. S. patent is a good thing for many reasons. It obviates all necessity for further assessment work, eliminates all likelihood of annoyance from "jumpers," almost wholly does away with possibility of litigation and, in case of desire to sell nothing, next to known value, will insure the sale of a mining property more readily than the fact of its being covered by a U. S. patent.

THE Copper Queen M. Co. at Bisbee, Ariz., has put in machinery for the annihilation of the microbe infesting the water used by the employees. The water is put through a process of distillation, then pumped into tanks to cool. The water is also placed at the disposal of the public free of charge. The Copper Queen Co. has put in a blower for blast to the converters that gives 10 H. P. to the square inch.

F. D. POWER, in reviewing an article on the Australian gold fields, says: "The various kinds of rocks in which gold-bearing reefs occur will astonish those whose knowledge in these matters is limited. Examples are given of deposits occurring in diorite, diabase, felsite, quartz porphyry, granite, syenite, andesite, porphyrite, rhyolite, mica, chloritic, seritic, talcose, and amphibolite schists, serpentine, slate, sandstone, and conglomerate."

THE old way of buying a 20-stamp mill as soon as a mine was bought or bonded is no longer generally observed. Men more modestly now start with a hand windlass for hoisting, then put in a small engine—steam or gas—for hoisting and pumping; afterwards, if justifiable, come the mill, concentrators, etc. While not so much mining machinery is at first called for as under the old way, yet to the mining machinery manufacturer it is often more profitable, as when he does get the order payment is more certain than before.

THE Hooley disclosures in London are fresh evidence that the evil practices unjustly ascribed to American mining men are of actual existence across the sea. The latest expose calls to mind the Londonderry mine, Coolgardie, West Australia, the original English purchasers of which cutely succeeded in unloading onto another English concern for \$2,000,000. The new directors discovered they were swindled, but secured the publication of statement that "within sixty days five tons of gold would be won." Then they had a meeting, at which glowing reports were read, while the directors, sitting soberly around the board, had telegrams in their pockets that "the reef is barren of gold." The published accounts enabled them to unload, and, just after, the facts came out.

THE Sulphide Reduction New Process Company is building a plant at Llanelli, South Wales, where the Ellershausen process for reducing zinc-lead sulphides will be used. The sulphides of zinc and lead are roasted at a white heat in a reverberatory furnace, with oxide of iron, lime and coal. The lead and zinc come off as fumes and the sulphurous acid comes off as well. These mixed gases and fumes are inducted through water by a fan. The lead is condensed as oxide and sulphate; the zinc as sulphate passes into solution. Some of the silver goes over with the lead, but most of it stays in the slag. The lead compounds are put back into the furnace, and the resulting mixture of slag and lead compounds is run off, afterwards to be treated as ordinary lead ore. The zinc solution may be treated in any desired way, but Ellershausen prefers to treat it with sulphide of soda, thus forming a white sulphide of zinc, which can be treated for the metal in the usual way.

THE Selby Smelting and Lead Co. of San Francisco are prepared to purchase osmium-iridium (a natural alloy of osmium and iridium) in quantities of one ounce and upwards. This metal, or alloy, has been found in various placer mines in California, particularly in the northern part. Owing to its high specific gravity, approximating closely to that of gold, in washing sand and gravel it concentrates with the gold. It can be easily distinguished by its bright metallic color and flat, scaly appearance, is insoluble in acid, and cannot be melted by ordinary furnace heat. The shape of grain is irregular, has a ragged edge, and varies in size from that of fine to coarse sand, and often larger. As the market for osmium-iridium has been limited, little attention has been paid to it on this coast, but it is believed considerable quantities may be found if miners will turn their attention in that direction. Should anyone find any of this metal, the Selby Smelting and Lead Works, 416 Montgomery street, San Francisco, will be pleased to quote rates on receipt of sample.

Recent Advances in Silver-Lead Smelting.

Read by R. H. TERHUNE of Utah at the Salt Lake session of the International Mining Congress, July, '98, and specially reported for the MINING AND SCIENTIFIC PRESS.

While many of you have suffered greatly by the fiscal policy of the world in the demonetization of silver, there is much left that gives you hope; old processes are being improved and new ones arising, until it goes without saying that values and quantity having been established, some method of extraction can be depended upon.

There are "cyaniding," "chlorination," "amalgamation," the so-called "combination process" of plates, vanners and pans, and, latest of all, "bromine extraction," offering much promise for treating coppery ores if free from lime and yet too base for amalgamation. Then we have, which is the topic of this paper, the time-honored shaft furnace process for silver-lead smelting, which takes ores which all other methods give up, asks few questions, and paid the miners of Utah in 1897 62.6 per cent of the New York value of the entire contents of each metal.

Decline in cost of coke, iron and limestone, 18 years,
62.70 per cent.

From the above it is shown that coke is the expensive factor of our business; but far as we are from attaining the theoretical effect of fuel in the blast furnace, we are nearer to it than the old Sheffield pot-melting furnace for steel, which required two and one-half tons coke to the ton of steel melted, equaling $\frac{1}{7}$ the theoretic or calorific value of the fuel, or the coal-fired, iron-heating furnace which used $\frac{1}{3}$ tons of coal to the ton of metal heated to 2900 degrees Fahrenheit, equaling $\frac{1}{5}$ the theoretic effect of the fuel. In lead practice we exceed $\frac{1}{3}$ the true calorific effect of the fuel, for we heat 2000 pounds of slag to 2000 degrees Fahrenheit with 517 pounds of coke, besides requiring of this fuel other functions.

The value of hot blast would be great to us were it not for the necessity of solid carbon in the charge. This could not easily be reduced in quantity and as it now affords the necessary heat and reducing power, the gain from the custom mills is so rare and usually so unsuccessful that smelting has proven a blessing to small miners, and the world over it has afforded them a certain and good market for one ton or ten tons of ore.

No other process than smelting extracts 100 per cent of your gold, and few extract as much silver. Under proper conditions it can take any part of the earthy crust of our planet, turn it into a liquid slag and remove its values. Follow in your imagination the complex charges of a lead blast furnace, often containing ore from twenty-five mines and perhaps half as many districts, from its entry at the feed door to the discharge below, of four well-defined new products—matte, speiss, bullion and slag—and you must concede it a wonderful even if it is a commonplace process.

The improvements in silver-lead smelting in recent years have been along the following lines: The judicious location of plants; the introduction of steel

buildings; the increased size of plants; the increased sizes of blast furnaces; the improved means of slag disposal and separation; better sanitary conditions about works; dispensing with heat roasting; improved system of flue dust condensation; the use of automatic roasting furnaces; improved crushing machinery; the briquetting of fine ores and flue dust; internal system of tramways; better power plants; improved rotary blowing machines; better railway service; chemical basis of ore purchase; tendency to uniform systems of assaying; improvement of men and service under eight-hour system; piston blowers.

The first move was in the judicious location of plants, with reference to proper mixture and supply of ores and cheap and ample sources of good fuel and fluxes, due regard being had to the market for bullion. Unwise and often fraudulent boom plants with their pernicious effects upon capital, communities and legitimate enterprise, are becoming more and more rare, thanks to a vigilant and generally honest technical press as well as to experience.

The growing use of steel for building purposes is economical in insurance of premises, the stability of a business and offers special freedom from anxiety which must attend wooden structures for roasting and smelting purposes. The large plant, the outgrowth of competition, as in all other lines, has lowered fixed charges and made large contracts with their attendant advantages possible.

The large blast furnace has called forth better structural work, in which arches with tension bolt chords have given place to the old type of cast iron deck plate, to sustain the brick superstructure, and stronger caissons to enclose the lead well or crucible. The best practice is to not attempt to resist a pressure that is almost infinite, but to provide releasing bolts to let out these plates at the beginning of a run; solid steel plates under the lead enable are now replacing riveted ones, thus preventing any possible leak of bullion; often twenty tons of bullion have been found under riveted plates.

The cross section of blast furnaces at tuyeres doubled and feed floor trebled in twenty years, while the height has in some instances been increased 50 per cent; the long rectangular form has almost entirely displaced the square or circular cross section. Twenty years ago a tuyere area of 42 by 72 was almost general. Now 44 by 144 is employed. In that early day 36 square feet at feed floor was used; now 108 square feet are common. Heights have risen from 12 to 18 and 20 feet, but the practice now shows a downward tendency in this regard. As a compact column does not admit the blast, walls of blast furnace have reached a thickness of 31 inches at the mantel, giving greater durability as they better resist expansion, and retard radiation of heat.

The return to the withdrawal of furnace gases overhead, instead of the innovation of under the feed floor, may be regarded as an advance, reducing flue dust production and admitting of more correct feeding of the charges. Better and stronger water jackets, with simplicity of tuyere fittings, may be regarded as an advance.

Large settlers for the separation of matte are coming into general use. These are made rectangular, and of sectional side and end plates and lined with brick to reduce loss of heat.

Improved means of slag disposal rank as a great advance. One system employs a bowl, or bowls, mounted upon a railway truck, the clean settler overflow slag being dumped hot. The other system, which is certainly the most advantageous, but only possible with an adequate water supply, is that of granulation: where the stream of slag is struck by a jet of water and reduced to granular form that will all pass a one-quarter mesh sieve. It is conveyed by water to an elevator and is thence handled automatically to the point of delivery upon tram or railway cars. The employment of conveyors to carry this material to a dump is about to be adopted.

I find that a jet of water from a slightly flattened 2-inch pipe under a 13-foot head is ample for the purpose of granulation; the region of the trough where the stream or slags falls is of necessity water-jacketed to prevent adhesion of slag to iron, of pieces that may pass the jet of water. The granulated slag is conveyed by the jet and jacket water down short troughs leading from each furnace into a longitudinal main, 2 feet wide, with cast iron bottom, and sloping one-quarter inch to the foot. Water for carrying 100 tons slag per day to an elevator pit over 100 feet distant is supplied from a 10-inch square box under 13-foot head. Heavy rubber belts and malleable cast iron buckets render good service. This system of slag disposal is growing in favor, and is certainly to be preferred to all others when practicable. It is the only system from which a perfect sample of slag can be obtained.

Artificially ventilated buildings, with paved tapping floor, constitute a great advance as a sanitary and economic measure. These are gradually giving way to the cramped structures of the past. Better service is secured, and ore and rich products, instead of being trodden in adobe floors, can be easily and regularly recovered.

As the blast furnace operation depends almost wholly for its success upon the reducing gases passing upward through the charge, it is clear how im-

portant it is that these gases have clear and well distributed passage. This necessitates a certain degree of porosity of the column of material in the furnace. Along with these gases much fine material is carried, constituting what is known as flue dust. Its successful condensation is very important. American progress in this direction consists in making flues aggregating one mile in length in which the gradually cooling gases deposit fine particles held in suspension, and such particles, all carrying values, are found at the base of the very tall chimneys employed for artificial draft.

Europe, earlier active in all industrial economics, had long ago led us in the employment of very long flues.

The other system for accomplishing the same results in a quicker manner consists in aspirating the furnace through an iron flue, and, thus being sufficiently cool, they are forced with the same fan through inclined planes, nearly vertical, of cotton cloth. When the accumulation of deposits upon the huge filters is indicated by an increase in pressure, as shown by a gauge, rocking shafts with arms shake off the solid matter, which is precipitated to the bottom of the large brick buildings.

As mines have deepened and the percentage of sulphurets in ore has increased, the problem of roasting has become one of increasing importance. In early days heap roasting of mattes and coarse ores was universal in this valley. Then came the short hand reverberatory, then the long one, and now in Utah automatic roasting furnaces have almost wholly displaced the hand-worked variety. Whole batteries of hand furnaces have been discarded at a cost of \$3000 each. There are various types of the automatic, all having certain merits and all their champions among metallurgists.

The Bruckner cylinder is in much favor in Salt Lake valley; the repairs are light, labor and fuel low, the time for oxidation not limited, as in rabble furnaces, and since the economical briquetting of flue dust was introduced, its production of that material is not the great objection that it once was. Ores containing 32% lead are now successfully roasted in them, and ores containing 30% zinc and 10% lead offer no difficulty, but require careful firing. The present and latest practice is to employ very large cylinders 26½ feet by 8½ feet and run them very slowly—one turn in forty minutes—the charge being seventeen to twenty-two tons and time thirty-six to forty-eight hours. I understand cylinders 28 feet long are in contemplation.

The first Ropp roasting furnace in this State was erected in the summer of 1896. Two years of use have proven it to be an excellent type of rabble furnace, requiring little labor and, compared with hand furnaces, little fuel, not costly to maintain and capable of treating a wide range of ores, with a very small make of flue dust. With structural changes, developed as necessary by experience, this furnace certainly will occupy an important place and a permanent one among straight-line rabble furnaces. The furnace built at the Hanauer Works in 1896 had the following dimensions: Width of hearth, 14 feet; total length of hearth exposed to head, 129 feet 6 inches; number of fire boxes, 4; area of each, 20 square feet; number of rabbles, 6; speed of rabbles, per minute, 80 feet; capacity in twenty-four hours, 25 to 40 tons.

There were roasted in ten months in this furnace 10,830 tons of 2000 pounds each of Bingham ore of the following composition, as shown by a partial analysis: Silica, 10; sulphur, 39.42; iron, 31.52; lead, 9.20; zinc, 4.23. The following were the results: Average sulphur in roasted ore, treating 39.18 tons per twenty-four hours, 6.37; average sulphur in 33.78 tons, 5.75; average sulphur in 30 tons, 5.10. Ore of the following composition is successfully roasted without slagging to 5.4% sulphur: 26.10 lead; 18 silica; 14.50 iron; 11.80 zinc; 26.90 sulphur. A 400-ton lot of ore of the following composition was treated at the rate of twenty-five tons per day to 6.7% sulphur, showing an oxidation of 66.1% of the zinc, which existed as blende in the ore: Silica, 9.20; zinc, 16.70; iron, 16.60; lead, 17.40; sulphur, 29; copper, 4.20. All the ore was crushed to pass one-quarter inch mesh screen, and yet but 11,000 pounds of flue dust were caught in 107 feet of flue.

It is found that the travel of the rabbles of this furnace exterior to the furnace, for a greater distance than they travel through the hot region, contributes to their endurance. The set remotest from the fire has roasted 16,569 tons of ore and matte and was still good; that nearest the box required renewal after roasting 14,419 tons of material.

One multiple hearth Kellar roasting furnace has been erected in Utah. It is beautiful in its mechanism, low in fuel consumption, but not capable of treating so wide a range of ores as might be desired, as it depends upon the burning sulphur in the ore more for a source of heat than other furnaces.

Improved crushing machinery has exerted some influence in lowering the cost of preparing ores for roasting. I have had better success with chilled iron roll shells than with soft steel ones. The "briquetting" of flue dust and fine ores, such as the roast furnace product and concentrates in general, has proven a most economical substitute for fusion as a means of rendering this class of material coarse.

The latest development of the briquetting machine produces sixty to seventy tons per day of small, hardened, flat, rounded discs, under great pressure, with caustic lime as a bond. They quicken the blast-furnace operation, and greatly contribute to general cleanliness about the works.

The rotary blowing machine is now made of great strength with heavy shafts, cut steel gear, large pulleys, long and improved journals, all resulting in a machine suited to high pressure and steady service. Compared, however, with the piston blower, it is an imperfect one, as the latter is the only positive machine that can deliver all the air which enters its cylinders. One western works is installing such a plant, although at a cost of 50 per cent greater than the rotary.

The eight-hour law for mining, smelting and other unhealthy pursuits which has been in force in Utah since June 1, 1896, though at first working a hardship upon employers (as it resulted in a slight advance of wages) has proven less of a bugbear than it at first appeared. The quality of the service in smelting has improved; and, as an economic measure, the general eight-hour system must have far-reaching value and is of national importance. A tending to employ 50 per cent more men in pursuits operated twenty-four hours per day improves their moral and physical condition, promotes human happiness and the coveted harmony between capital and labor.

Slag Elevator.

The handling of granulated slag and water is a problem which has received much attention at the hands of smelting people in the past. Owing to its fineness and gritty nature, it rapidly wears out any machinery with which it comes in contact. To design machinery for handling this material so as to reduce the wear to a minimum is of importance. This, the Jeffrey Manufacturing Company claim to have accomplished in the plant illustrated herewith.

SLAG ELEVATOR OF THE SILVERTON SMELTING CO., SILVERTON, COLO.

The elevator is 60 feet in height and in operation receives the slag and water below and elevates it into the sluice box overhead in connection with the head of the elevator. It is provided with double chains and steel buckets which operate over two sets of wheels at the head, being knuckle wheel construction. This discharges the slag and water into the hopper connected with the sluice box without the usual spilling common to elevators which depend upon centrifugal force to discharge their load. The chain used is one of the Jeffrey steel bushed type. Its wearing parts are of case hardened steel, which, when they become worn are easily replaced at small expense. The elevator is driven by a manila rope drive from the engine on the ground below. This outfit has been used for two years, having been installed at the plant of the Silverton Smelting Company, Silverton, Colorado. The elevator was designed by the Jeffrey Manufacturing Company, and all requisite details may be obtained by addressing their western branch, Frank R. Field, representative, Denver, Colorado.

The Geology of the White Pass.

AMONG THE LAKES ON THE
HEADWATERS OF THE YUKON.
June 15, 1898.

No one can travel over the deep blue waters of the Lynn canal, with its environment of mountain, glacier and snow, nor scale the White pass and view from its summit the wilderness of snowy peaks, nor descend through the chain of lakes on his way to the gold fields, without feeling a more than passing interest in the geology of the country. Even though his eyes are more or less dazzled by the golden halo encircling the Klondike, still the surrounding beauty and sublimity inspire him with a desire to decipher the inscriptions engraved upon the monument of Nature standing before him.

Commencing at Skaguay the prevailing formation is a massive granite which has been more or less disturbed, as has been evidenced by numerous dikes of aphanite, quartzite, etc., as well as various ledges and stringers of quartz. The information concerning the value of the quartz in the drainage basin of the Skaguay is decidedly meager; beyond that, so far as discovered, it is very base and has the appearance of being low grade as well. In the present stage of development the indications are unfavorable for the existence of commercially valuable bodies of ore, although, of course, there is a possibility that further prospecting may reveal the existence of richer mineral districts.

While there are numerous benches and flats favorable for gravel deposits still, as far as examined by the writer, the gravels deposited thereon are lamentably deficient in both quartz and gold. Regarding the alleged auriferous gravels underlying the town of Skaguay, it is sufficient to state that on account of their loose character and the water to contend with, they would have to be phenomenally rich to pay.

About five miles above Skaguay the formation changes to a belt of comparatively thin-bedded gneiss several miles in width, containing various dikes and stringers of hungry quartz. Next come the hard, massive granites composing the backbone of the range, and which, like the preceding formations, are chiefly valuable for scenic purposes.

When the summit is reached one can look from the sharp peaks of the mountains beyond the Lynn canal on the south and west to the rounded crests by and beyond the larger lakes to the north and east, and gain a fuller and more comprehensive idea of the magnitude and significance of the various changes marking the geological history of this section.

In broad lines, to the southward, the ranges are sharp and rugged, with steep and often precipitous sides, showing not only their more recent origin but their escape from the glaciation which planed and rounded off the ranges of the interior. This difference is noticeable from the very summit. Extensive as has been the glaciation of the interior, it evidently occurred a long time ago, as subsequent erosion has not only destroyed the polish and scoring, excepting in protected places, but has altered the surface of the country to a marked extent, although the general contours characteristic of glaciation are still retained.

The most marked evidences of glacial action are found in the basin containing the lake system forming the headwaters of the Yukon in this section. The long-continued glacial action formed the basin and hollowed out the beds of the present lakes. At one time the entire basin was filled by one immense glacier, formed by the union of a large number of lateral glaciers which descended from the surrounding heights. As that glacial age drew towards a close and the diminishing of the main glacier uncovered portions of the basin, the tributary glaciers again began an independent existence and furrowed the basin with their courses. As the ages passed they, too, gradually receded until to-day only their remnants are found at the heads of their former courses. Some of these relics of a former age are good-sized masses of glacial ice; others are simply banks of crystalline snow which, although it remains from season to season, is thawed by the unfrozen ground beneath with sufficient rapidity to prevent it from becoming firm ice.

Not only did the glaciers carve out the present lake system, but they also took the first step in the formation of a series of mountain meadows. From the recession of the glaciers, the lakes and shallows have been slowly filling with the sediments from the surrounding country until now some of the lake beds have become entirely filled and are meadows, while all stages of formation, diminishing with the progress downstream, are found in the others. Incidentally, the soil of these meadows, formed primarily from the sediments of feldspathic rocks, is exceedingly rich and is not only excellently adapted for the various grasses, but for the growth of any crops allowed by the shortness of the season.

The ice age, to which all of this glaciation belongs, is still passing away, for the rudiments of the former glaciers are receding as is indisputably proven by their terminal moraines. This fact is simply one of the many indications that the climate of the extreme northwest is undergoing important changes.

In connection with the evidences of past glacial

action, Crater peak, which stands on the eastern side of the meadows, is one of the natural curiosities of this section. It rises some 7350 feet above sea level and at an elevation of 6200 feet is what appears to be the lip of a crater whose outer wall is built up by an accumulation of tufa. In fact, so perfect is the resemblance, with the precipitous walls of light-colored feldspathic rock rising up behind the lip like the fire-scorched inner walls of a crater, that any one is to be pardoned for considering it an extinct volcano at first sight. However, examination shows that this crater lip is simply the terminal moraine of the rudiment of a former glacier. The fact that the loose rock rolled down the steep mountain side until the front of the moraine assumed the angle and appearance of a crater rim formed by loose volcanic rock and sand, aided of course by the color of the formation, is what completes the illusion.

While there is a greater variety of formations on the inland side of the summit, the mineral outlook is but little better than on the other side, although there is more quartz and some fine magnetite of iron float. The ore thus far discovered is too base and low grade to be available, although there are some good-sized bodies of it.

Among the formations is a belt of overlying feldspathic rock which commences at an elevation of some 5800 feet, and this belt is so broken up and seamed by dikes of all descriptions that its structural strength has been lost, consequently it fissures easily and rapidly breaks down and disintegrates. So rapidly has it given away before the forces of erosion that many of the mountains which were rounded by glaciers are now as sharp and rugged as though they had never been touched by them.

A. THURSTON HEYDON, M. E.

Under date of July 12 Mr. Heydon writes: Since writing the preceding article I have found a mineral district of some importance in a basin west of Middle lake. While the oxidized portions of the ledges would furnish free-milling rock that would pay a dividend in California, still, although the ore bodies give evidence of being large, it is doubtful if they become available at an early date. Beyond the reach of surface action the ore is decidedly base and shows a strong resemblance to that of the Big Canyon mine in El Dorado county, but on account of the altitude above timber line and the shortness of the season, the expense of working would eat up the profits from ore carrying 5 per cent sulphurets, worth \$100 per ton of concentrates. The most interesting feature about this mineral district is that placer gold occurs below it and that some of the bars contain fairly good streaks, although they are narrow and the gold is inconveniently fine. However, a more thorough prospecting might reveal the existence of coarser gold in better paying quantities.

Electrical Furnace as Used by Moissan.

Rudolph Mewes gives an account of the employment of the electric furnace and of the efforts made, before its introduction, to attain very high temperatures. It is pointed out that Moissan claimed for his furnace that it was an appliance strictly for scientific research, and not for technical uses. According to the nature of the work to be undertaken, there were five varieties of furnaces, and the strength of the currents employed varied between somewhat wide limits. Diagrams are given of the furnace, and an outline follows of the various researches undertaken by Moissan on the volatilization of certain refractory substances. These served as the basis of experiments upon the crystallization of the oxides of calcium, strontium, barium, magnesium and aluminum, and the oxides of the iron series. Subsequently he investigated the reactions in the electric arc of the metalloids—silicon, boron and carbon—and the distillation of silicic acid. His later experiments upon the production of carbides and double carbides have led to discoveries which, in the case of calcium carbide, are capable of practical industrial application. He has recently succeeded in producing artificial diamonds by causing molten iron to take up large quantities of carbon; the crucible containing the glowing mass is then rapidly withdrawn from the furnace and plunged into cold water. The result of this is that an outer solid coating is formed which occupies a less volume than the heated mass within, and exerts great pressure on the interior during the cooling process, in the course of which the diamonds crystallize out.

A PLAN has been introduced to some extent in engineering practice of winding steam pipes over 8 inches in diameter with $\frac{3}{16}$ -inch copper wire doubling the bursting pressure, and is one of the most important of recent changes. That the thickness of sheet copper forming the pipe may be reduced to the minimum, and at the same time insure the full advantage of wire winding, the system of manufacturing steam pipes has come into vogue of simply using copper of the thinnest possible gauge to form the interior or core of the pipe, while the body proper is composed of steel wire wound closely around the core, the interstices being filled in solid with copper by electro-deposition.

Alder Gulch, Montana, Tailings.

Tailings from the former rich placer gold mines of Virginia City, Montana, carry considerable value, and are being worked with profit. The German Bar Placer Mining Company has a novel plant on the old German Bar workings, three miles below Virginia City, where a small area of bedrock that had been uncovered by recent hand working gave them an excellent location in which to commence work. It is thus described in an interview in the Spokane, Wash., *Review*:

The problem required a three-fold resolution. 1. The excavation and handling of large quantities of material at a low yardage cost. 2. The delivery of this material at such an elevation that a gold-saving flume could be used, of sufficient length and grade to thoroughly save the finer gold which had escaped the original miners. 3. The delivery of the tailings at such an elevation that their disposition would take care of itself.

To solve the problem a novel application of the well-known cableway principle was adopted, with the addition of a drag or scoop bucket, self-loading and self-pumping in action. This combination adds to the hoisting and conveying capacity of the cableway the elevating function of a steam shovel. The cableway is self-portable, with the tall tower arranged so that it may be moved in a circle about the head, or hopper tower, the excavation being made along radical lines, and a semi-circular pit being thus worked out around the hopper.

The hopper tower was placed on bedrock in the pit previously worked out, and close to the face of the gravel to be excavated. This tower is built solidly of 8x8 timbers and extends up through the hopper, which it carries, and which surrounds the tower on three sides to a height of 67 feet. It has a square top about 9½ feet on each side, strongly tied together with 8x8 timbers, but open in the center and covered with an angular iron plate upon which a smaller pyramid tower, or bonnet, 8 feet in height is placed. This bonnet carries the saddle for the main cable support and the sheaves for the operating ropes. It rests upon the angular plate, and also is encircled at the bottom by an iron guard band attached to the top of the fixed tower. The bonnet is thus adopted to turn about the main axis of the tower and at the same time is open in its center so that the operating ropes may come up through the tower below.

The engine, both for convenience of location and to enable the operating ropes to pass over and clear of the hopper, was placed on higher ground at one side, and about 100 feet away from the tower. The motions of the carriage on the cable and the bucket in the pit are controlled by an endless or traction rope and a hoist rope. These ropes pass from the engine under fixed sheaves in the main tower, just above the hopper, from which they are guided around two sets of deflecting and swiveling sheaves, one set in the main tower and the other in the bonnet, to another series of fixed sheaves in the bonnet, and thence to their work. The purpose of the open center of the top of the tower is thus apparent. These banks of deflecting and fixed sheaves are ingeniously arranged so that the bonnet may turn through more than a half circle in its revolution, and the ropes will lead fair, never crossing or fouling each other.

Making Water Lift Itself.

Where it is desired to lift water from a rapidly flowing stream to high land adjacent, a method just introduced on Table mountain, in Lake county, Cal., may be serviceable. It is on the place of Granville Libby; the plans, calculations and construction were the work of D. Libby, Jr., of San Francisco.

The foundation of the works is built in an excavation of solid rock, a few feet above the level of Putah creek. The foundation and walls are built of concrete and should last for centuries. The walls are about 3½ feet high and 15 inches thick. The bearings for the wheel's axle are firmly bolted to the top of the wall. The wheel is an overshot water wheel, 6 feet in diameter, with 30-inch face. This furnishes power to run two 3-inch vertical plunger pumps, which force the water through 1350 feet of 1½-inch pipe to an elevation of 335 feet.

A flume 125 feet long, 30 inches wide and 8 inches deep, conducts water to the wheel. In the rainy season the wheel can be lifted high and dry out of its place, and when desired can be replaced again in a few minutes. The apparatus is supplied with self-acting lubricators, which need refilling about once in a week or ten days.

Near the building there are five or six garden valves for house, barn, garden, etc., to any of which a hose can be attached if desired. Mr. Libby filled a tank of 1200 gallons last week in one hour and forty minutes, or just twelve gallons per minute, which makes 17,280 gallons per day of twenty-four hours. This vast amount of water seems incredible by such a simple method.

ACCORDING to the *American Manufacturer*, M. Savreux finds that boiler deposits are fairly easy to remove under particular conditions. Rake out the fire, and let out the water only in small quantities,

replacing each such quantity by cold water, so as to keep the boiler filled. When quite cold, let all the water suddenly out. A great deal of the deposit will come away with it, and the remainder can be rather readily removed by scraping and brushing. But the cleaners have to be quick about it, for the deposit soon hardens and again sticks to the iron. At a works in Amiens the fire was let out on Saturday night; during two hours on Sunday the boiler was filled with cold water; Wednesday the boiler was polished; Thursday the water was again changed; and the same on Saturday. Sunday the water was let out, and the boiler promptly cleaned. The *Boiler Union's Journal* speaks well of this method, which is, of course, only applicable where there is a reserve boiler to fall back upon.

New Coupling for Cams.

Herewith is illustrated a new cam invented by Thos. J. Barbour of San Francisco, and by him assigned to the Risdon Iron and Locomotive Works of San Francisco, which is now manufacturing them in considerable numbers. The claim for the invention is the combination with a series of tappet cams of a series of interchangeable cam wedges for locking the tappet cams to the drive shaft of a stamp battery in relatively different positions so as to control the drop of the stamps, each cam wedge being

NEW COUPLING FOR CAMS.

provided on its under face with a feather, and the feather of each cam wedge being differently located relative to the butt of the other cam wedges. 2. The combination in a stamp battery of the drive shaft provided with a feather way, of a series of cams mounted thereon, and of a series of interchangeable cam wedges for locking the cams to the drive shaft, each cam wedge being provided with a feather which fits in the feather way of the drive shaft, the feather of each cam wedge being differently located relative to the butt of the other cam wedges, whereby the position of the cams is altered as to the drop of the stamp with a change of the cam wedges. 3. The combination with the drive shaft of the parallel feather ways cut therein, the tappet cams mounted upon the drive shaft, and the cam wedges for locking the cams to the drive shaft, each cam wedge being provided with a feather which fits each of the feather ways of the drive shaft, the feather of each cam wedge being differently located relative to the butt of the other cam wedges, whereby the position of the cams depends upon the feather way in which the feather of the cam wedge is fitted. 4. The combination with the drive shaft of the tappet cams mounted thereon, and the interchangeable cam wedges for locking the tappet cams to the drive shaft of a stamp battery, each cam wedge being capable of adjustment upon the drive shaft and having its fastening device differently located relative to the butt of the other cam wedges, whereby each cam wedge permits of a different position to be given the tappet cams to vary the drop of the stamps.

The distinctive feature of the cam is that in interchanging the keys one can alter the drop without having to drill any holes in the shaft, obviating other ordinarily attendant delay or annoyance in connection therewith.

The Mechanical Action of the Divining Rod.

The review in *Nature* of a publication relating to the "divining rod" recalls to my mind a purely mechanical theory of that rod, which was given me years ago by a friend.

This theory has been repeatedly tested by me and shown to be correct in the presence of my class. The process is exceedingly simple. Take any forked twig of reasonably tough fiber in the clenched hands with the palms upward. The ends of the limbs forming the twig fork should enter the closed fist on the exterior side of each fist, i. e., on the two sides of the clenched hands farthest from each other.

When a twig is grasped in this position it will remain stationary if held loosely, or with only a moderately firm grasp, but the moment the grasp is tightened the pressure on the branches will force the end of the twig to bend downward. The harder the grip the more it must curve.

The curvature of the twig is mechanically caused by the pressure of the hands forcing the limbs to assume a bent and twisted position; or the force that caused the forked limb to turn downwards is furnished by the muscles of the hands, and not by any other cause.

The whole secret of the divining rod seems to reside in its position in the hands of the operator,

and in his voluntarily or involuntarily increasing the closeness of his grasp on the two ends of the branches forming the fork.

If the above conditions are fulfilled the twig will always bend downward—water or no water, mineral or no mineral. Any one can be an operator, and any material can be used for the instrument, provided the limbs forming the fork are sufficiently tough and flexible.

It can be easily understood how an ignorant operator may deceive himself and be perfectly honest in supposing that some occult force, and not his hands, causes the fork to curve downwards.—M. E. Wadsworth, President Michigan College of Mines, Houghton, Michigan, in *American Geologist*.

Coal Output for '97.

The Geological Survey has partially completed its report on the coal output of the United States for the calendar year 1897. It shows that the total production of this article reached a higher figure than ever before.

The total output was 200,221,665 short tons, equivalent to 178,769,344 long tons of 2240 pounds, with an aggregate value at the mines of \$198,869,178.

The total output in the State of Utah was 521,560 short tons, valued at \$618,230, an average of \$1.90 per ton. The average number of employes in the Utah mines during the year was 704, and the average number of days there were employed was 204.

In the State of Wyoming the total product was 2,597,886 tons, valued at \$3,136,694, an average of \$1.21 per ton. The number of employes was 3137, and the average number of working days 219.

Coast Industrial Notes.

The B. C. Iron Works, Vancouver, B. C., has failed.

An Astoria, Or., factory made 7,500,000 salmon cans this year.

The Oregon Short Line will pay 3% on its income bonds Oct. 1st.

The Los Angeles, Cal., assessment for '98 is more than \$61,000,000.

A street railway is to be built at Patzcuaro, Michoacan, Mexico.

The wool sales in Lake county, Oregon, from July 1st to 14th amounted to \$50,000.

Nearly every commercial organization on the Pacific coast favors the retention of the Philippines.

Sheep and wool sales in Lake county, Or., from July 1st to September 1st will aggregate \$250,000.

From Pendleton, Or., were shipped to Nebraska last week 380 head of cattle; they sold for 3½ cents a pound.

In the Kincon asphalt mines in Santa Barbara Co., Cal., belonging to the Alcatraz Co., work has been resumed.

During the week the thermometer indicated 110° Fabr. in the interior Cal. valleys, and 54° at San Francisco.

The first locomotive that ever moved a wheel in Alaska pulled out of Skaguay July 21st with a string of flat cars.

A line of steamers is projected between Port Arthur and Puget sound, to run in connection with the Siberian railroad.

Mexico has twenty-one completed blast furnaces and two building, seven rolling mills, and two partly completed open hearth steel plants.

Pennsylvania capitalists have taken the 100 bonds of local improvement district issued at Tacoma, Wash. They draw 8 per cent and run ten years.

Work has begun on the 24-mile piece of railway to connect the Visalia branch of the Valley R. R. with the main line running to Bakersfield, Cal.

The Mexican railroad reports gross receipts for the 29th week of the year of \$78,389.88, against \$77,378.62, for the corresponding week of 1897.

The Santa Fe R. R. Co. is building at San Bernardino, Cal., of sheet steel, a tank 96 feet in diameter and 30 feet high, that will hold 36,700 barrels of oil.

There are 200,000 sheep feeding in the mountains of Alpine Co., Cal. The sheep license tax collected this season by that county amounts to \$6000.

In the Philippine Islands there are 750 miles of telegraph, but Manila is the only town that has a telephone system. It is owned by English capitalists.

The California Board of Public Works is to begin the work of building the jetty at Newton Shoals, in accordance with the suggestion of the Secretary of War.

The earnings of the whole Mexican Central Railway system for the third week of July were \$239,434, an increase for the corresponding period of 1897 of \$44,181.

In Astoria, Oregon, at a depth of 20 feet large pieces of coal were discovered when on being thrown upon a fire burned freely. The deposit is being investigated.

A cable is projected from San Francisco to Hawaii, the Ladrone, the Philippines and Hongkong, to cost \$10,000,000. The Pacific Cable Co. is capitalized for \$100,000,000.

During June there were exported from Progreso, Mexico, 39,514 bales of henequen, weighing 6,454,434 pounds. The bulk of it went to the United States and England.

McLean Bros., who have secured the contract to run the 3100-foot tunnel on the C. & N. railway, in British Columbia, estimate that it will take 130 men one year to do the work.

The Central Pacific road, between Ogden, Utah, and Truckee, Cal., uses coal mined at Evanston, Wyoming, which costs \$3 per ton at the mine, and annually consumes 300,000 tons.

The Mexican government has made a contract with Rossi & Chesio to exploit the deposits of guano on the desert islands in the Gulf of Mexico, near the coast of Yucatan and Campeche.

Orange shipments at Redlands, Cal., for the season approximate 487,640 boxes—more than double those of last year. The average f. o. b. price was \$1.75 per box, making a total of \$850,000.

The California Cotton Mills Co. of East Oakland, Cal., will increase their capital stock from \$600,000 to \$800,000 to enable them to increase their plant. Over 300 people are employed at the mills.

The Mexican General Electric Co., the Mexican branch of the General Electric Co. of Schenectady, N. Y., has been awarded the contract for the electrical installation equipment of the tramways of Mexico City.

Honolulu is to be fortified and made one of the strongest military posts in the Pacific. Major Langfitt, commanding a battalion of United States volunteers and engineers, goes there, followed by 400 expert engineers.

It is estimated that the salmon pack for the season of '98 on the Columbia river will be 100,000 cases below the average. Figures compiled by the *Astorian* show that 282,000 cases had been canned up to the 1st inst.

W. A. Bissell, freight manager of the Santa Fe system, says of the proposed steamer line from San Diego, Cal., to Japan: "The contract for the line is signed, and the steamers will begin their trips about Dec. 1st."

Oregon capital interested in the fisheries of Columbia river and on the sound reports

the season late, due largely to the cold weather. Fish are slack in the Columbia, and the run of sockeyes on the sound is not what it usually is at this time of year.

The clipper lines which carry freight from San Francisco to Atlantic ports have made another cut in their rates. Their new tariff ranges from 15 to 20 cents below that of the Southern Pacific, and from 6 to 11 cents under the rates recently made by the Panama railroad.

Men who have made a thorough study of the supply of green fruits in all parts of California estimate that about 4000 carloads will be shipped East this year, against 5300 in '97. The shortage is chiefly in pears, peaches and apricots. There will be an increase, however, in the shipments of prunes and raisins.

A citizens' committee at Portland, Or., has secured a twelve-acre tract of land in the eastern part of town for the terminal works of the Union, Corvucopia & Eastern Railroad, to be built from Union, Or., to the Seven Devils mines in Idaho. Bids have been asked for the construction of the road, bridges, etc., for a distance of 130 miles.

Work on the breakwater at San Pedro, Cal., is to start Oct. 1st. The work will cover a period of four years. The wall is to cost \$1,310,000; is to be 8500 feet long and of pyramidal shape. The top section will be 30 feet across and the base 175 feet. It is to be constructed of stone, except at the exposed ends, which will be monoliths of concrete, measuring 40x40x20 feet. On each end of the seawall will be a light to guide ships at night.

Everything points to an exposition of rare interest at the Sacramento, Cal., State fair this year. Sec. Smith says he has assurances that the manufacturers of the State will make extensive exhibits. The leading factories, being in and about San Francisco, usually exhibit at the Mechanics' Fair in that city. This year, however, there will be no Mechanics' Fair, and it is expected that many of the usual exhibits will go to Sacramento.

A Guaymas contractor buying iron roof beams in Chicago was given a freight rate by rail direct of \$1.25 gold per cwt., by the railroad. A railway running from Chicago to New York, connecting with steamship lines, gave on the same consignment a rate from Chicago to Guaymas of \$1.0½ per cwt. In one instance the freight would travel about 3000 miles without transshipment. In the other it would travel more than 10,000 miles, and be transhipped four times—yet the longer route would carry it cheaper.

According to local reports, Tulare lake, Cal., which is usually one of the largest bodies of fresh water in the United States, is now entirely dry. One of the newspapers of Kings county states that not a drop of water remains in the lake, and that over miles and miles of the former river bed of this peculiar lake there are exposed millions of decaying fish, lying in the mud and tainting the breezes which blow over that portion of the country. The nuisance has become so great that, when the harvest is over, most of the people will take to the hills for relief.

The Coalinga oil of Fresno Co., Cal., is lighter than the oil of Los Angeles and is used for refining purposes. The average depth of the wells is about 750 feet. Ten wells, belonging to one company, have been averaging seventy-five barrels of oil each daily. W. H. Watts of the State Mining Bureau was the first to call public attention to the probable value of this oil field, which he did in one of the bulletins of the Mining Bureau. Los Angeles men, who own 320 acres of land five miles southwest of Coalinga, on the line of the oil belt, are about to form a company for its development.

The Alaska Telegraph and Telephone Co., composed of San Francisco men, has a franchise from the Canadian government granting the right to construct, operate and maintain telegraph and telephone lines in Canadian territory over the Chilkoot pass, running along the lakes and up the Lewis and Yukon rivers to Dawson City. The line will begin at Juneau, Alaska, thence in a northerly direction to Dyea, thence in a northeasterly direction over the Chilkoot pass. It will follow the line of the Lewis and Yukon rivers to Dawson City and on to Circle City, the terminus. The estimated length of the line and its branches is said to be about 1000 miles.

Following is a present list of prices in the Klondike: Flour, \$8 to \$10 per sack; bacon, 50 cents per pound; ham, \$1.75 per pound; beans, 30 cents per pound; rice, 35 cents per pound; butter, \$2 per pound; eggs, \$1.50 per case; lard, 75 cents per pound; fresh sausage, \$1.25 per pound; sugar, \$1 per pound; condensed milk, \$1.50 per can; lobsters, \$3 per can; syrup, \$3 per can; oysters, \$25 per can; oranges, \$1 each; canned meats, \$2 per can; onions, \$1.50 per pound; cigarettes, \$25 per 1000; whisky, \$50 to \$75 per gallon; coal oil, \$30 per gallon; shoes, \$13 per pair; gum boots, \$25; dressed lumber, \$25 per 1000; rough lumber, \$200 per 1000; cheap cigars, \$250 per 1000.

Recent California Mining Incorporations.

Plymouth Rock M. & M. Co., San Francisco; capital stock \$100,000; subscribed \$50,000; J. A. Parsons, C. E. Brown, W. H. Murphy, C. D. Bailey, J. A. Sanborn.

Eureka G. M. & M. Co., Randsburg; capital stock \$500,000; subscribed \$400,000; A. W. Collins, A. J. Peters, E. Hammond, Jr.; E. S. Ely, J. W. Cummin.

Alpha M. Co., Yreka; capital stock \$50,000; all subscribed; T. Y. Reed, W. C. Stanley, L. F. Coburn, J. F. McBride, A. B. Shearer.

Victor Gold Mines Co., San Francisco; capital stock \$300,000; subscribed \$5; J. C. Campbell, L. Wordman, F. L. Lezinsky, E. L. Lowe, G. Lezinsky.

Sheba G. M. Co., San Francisco; capital

stock \$100,000; subscribed \$5; C. P. Yore, M. W. McIntosh, D. J. Wren, A. D. Wunder, G. O. Perry.

Aurora Gravel M. Co., San Francisco; capital stock, \$27,000; subscribed, \$700; G. H. Hawes, C. E. Kelley, J. Mott, S. A. Kelley, B. M. Wilson.

Mine Exploiting Co., San Francisco; capital stock, \$1,000,000; subscribed, \$125; N. S. Keith, A. H. Ward, F. A. Huntington, J. P. Massie, G. W. Osborn.

San Domingo M. Co., San Andreas; capital stock, \$100,000.

Yukon Oil Co., Los Angeles, formed to develop mining claims and oil wells; capital stock, \$25,000; subscribed, \$5000; W. A. Lamb, M. L. McCray, L. A. McCray, W. T. McFie, C. E. Rayne.

Personal.

Gov. GRANT of Denver, Colo., is in Spokane, Wash.

Jno. McMURRAY of Weaverville, Cal., is in San Francisco.

R. H. POSTLETHWAITE is at Lowden Ranch, Trinity Co., Cal.

D. JONES has been appointed Supt. Johnson mine, Stanton, Ariz.

A. WESTALL, a mine owner at Gold Lake, Cal., is at Palo Alto.

C. BORGER has resigned as Supt. Satellite mine, Campo Seco, Cal.

P. HOODS, Supt. Eagle Bird mine, Maybert, Cal., is in San Francisco.

A. R. F. PENROSE, a mine operator at Pearce, Ariz., is in San Francisco.

J. EDDY becomes Supt. Pine Hill G. & S. M. Co., Shingle Springs, Cal.

D. J. McFALL, Supt. Home mine, Nevada City, Cal., is in San Francisco.

A. McDONALD, Supt. Kanaka mine, Grove-land, Cal., is in San Francisco.

C. H. DUNTON, Supt. Larkia mine, Diamond Springs, Cal., is in San Francisco.

O. O. HOWARD, Jr., is inspecting the Mt. Shasta mine, near Redding, Cal.

P. REARDEN, late Supt. Abbott Q. S. mine, Williams, Cal., is in Denver, Colo.

T. HART becomes Supt. of the Bullard & Van Deever mine, Flat Creek, Cal.

H. J. RULE, Supt. Bowen mine, Tuttletown, Cal., has returned from San Francisco.

G. BLAKE, Supt. Bell mine, Tuttletown, Cal., has returned from San Francisco.

CAPT. THOS. MEIN on July 30th was in Victoria, B. C., on his return from Alaska.

J. B. ELDERIDGE of San Francisco is examining mining properties in southern California.

B. WILLIAMS is inspecting the property of the Copper Queen M. Co. at Nacosari, Mexico.

J. B. RISQUE has been appointed Assistant Gen. Mgr. Pacific G. M. Co., Silver City, N. M.

S. T. PEARSON of Salt Lake City, Utah, is visiting his placer mines at Gibbonsville, Idaho.

J. M. MCGREGOR, B. C. provincial mining inspector, is making his first visit through Rossland.

J. I. EDWARDS, after examining mining properties in California, has returned to New York City.

C. A. HAMILTON of San Francisco is examining mining properties in Shasta and Trinity counties, Cal.

T. H. SIMMONDS, Supt. W. Y. O. D. mine, Grass Valley, Cal., is at the German Hospital, San Francisco.

H. E. PICKET, Mgr. Grand Victory mine, Placerville, Cal., has gone to Pennsylvania for a health trip.

T. EWING, owner of the Sheep Trail mine, Fort Mohave, Ariz., has returned to Kingman from San Francisco.

J. L. PARKER, who has returned from England, resumes his position as Mgr. Dundee mines at Ymir, B. C.

J. F. WOODMAN, Pres. Centennial-Eureka mine, Eureka, Utah, has returned home after an extended Eastern trip.

J. LEOHEMAN has returned to San Francisco from Shasta county, where he has been examining mining properties.

T. J. CLAVERING, Sec'y and part owner Lincoln mine, Sutter Creek, Cal., has returned to San Francisco from the mine.

AUSTIN J. DOYLE, former chief of police of Chicago, is at Jamestown, Cal., to assume the management of the Alameda M. Co.

WM. ARMSTRONG, who operates mining properties in the State of Zacatecas, has returned to the city of Mexico from San Francisco.

W. VAN SLOOTEN, M. E., of New York City, part owner in the Plumbago mine near Alleghany, Cal., is expected in California in a few days.

F. F. THOMAS, Supt. Gwin mine, Mokelumne Hill, Cal., was in San Francisco last week attending the funeral of his brother, W. H. Thomas.

C. B. WINGATE of San Francisco is at the Chloride mine near Junction City, Cal., in which he is interested and of which he is Gen. Mgr.

W. J. HAMILTON of San Francisco is examining a mining property near Forbestown, Cal., for a San Francisco capitalist, with a view to purchase.

J. MCKELVEY, a mining man of Oakland, Cal., has returned from a trip to Nevada and El Dorado counties, Cal., where he exploited mining properties.

H. BRATNOBER has men at work for the syndicate he represents in the Last Chance mining district, Alaska, 200 miles inland from Pyramid harbor, forty miles northwest of

Dalton post. At present he and J. Dalton are inspecting alleged copper ledges at the head of Copper and Alek rivers.

W. H. SHOCKLEY, formerly superintendent of the Mount Diablo mine in Candelaria, Nev., is now reported to be interpreter and secretary for Li Hung Chang, the Chinese statesman.

H. A. COHEN will leave the management of Capt. De Lamar's interests at Mercur, Utah, the present month to be absent in Europe a year. W. H. Cunningham succeeds to the position.

F. J. HURLEY of New York, treasurer of Exploration Syndicate, is in Silverton, Colo. After a four months' sojourn in Europe he is quoted that American mining investments there are receiving much attention.

JOHN P. CLUM of Washington City, Post-office Inspector for Alaska, is establishing fourth-class postoffices along the Yukon at Circle City, Fort Yukon, Fort Hamlin, Star, Eagle, Rampart, Tanana and Nulato.

V. M. BRASCHI of the City of Mexico has returned home from an extended trip through the northern part of the Republic, from which he reports greater mining activity than has been known in that part of Mexico, particularly Durango and Nuevo Leon.

J. W. YOUNG, Mgr. Invicta Hydraulic Co., near Revelstoke, B. C., has returned from a six months' sojourn in England. He says there is difficulty in engaging capital in London for new ventures in that province—not for lack of faith in the mineral productiveness of British Columbia, but from disappointment over the manner in which one or two big concerns have been floated.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING JULY 26, 1898.

608,094.—TABLE—J. J. Anderson, Ellensburg, Or.

607,079.—DRAWING BEER—H. C. Black, Oakland, Cal.

608,102.—SASH FASTENER—L. H. Bowman, Walla Walla, Wash.

608,108.—RAISIN SEEDER—C. S. Cox, Fresno, Cal.

608,110.—HANDLE FASTENER—G. H. Dunlop, Hollywood, Cal.

607,844.—SNAP HOOK—Francisco & Shaffer, San Diego, Cal.

607,845.—PUMP VALVE—H. B. Gale, S. F.

607,930.—EGG BOILER—T. Holmes, Los Angeles, Cal.

608,049.—SEPARATOR—R. W. Jessup, S. F.

608,050.—SHIP'S GALLEY—F. Johnson, Seattle, Wash.

608,131.—CURRENT MOTOR—H. C. Keeler, Waterville, Wash.

608,142.—LOADING APPLIANCE—Kenfeld & Elvidge, S. F.

607,933.—FOLDING TENT—E. N. Laird, El Toro, Cal.

607,935.—DEMILJOHNS—J. Lenormand, S. F.

608,079.—HARNES—W. R. Phillips, Pomona, Cal.

607,877.—GATE SCREEN—A. P. Fritchard, Tacoma, Wash.

607,955.—ROCK DRILLS—P. H. Reardon, S. F.

607,956.—LUMBER RAFT—H. R. Robertson, Alameda, Cal.

607,965.—BOAT PROPELLER—S. S. Stevens, Point Arena, Cal.

20,096.—BELT DESIGN—J. F. Rose-Soley, S. F.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

DESIGN FOR BELT.—John F. Rose-Soley, San Francisco, Cal. No. 29,069. Dated July 26, 1898. This invention relates to a novel design for a belt. It consists essentially of a flat strip of leather or other desired material of suitable width having the body portion cut into narrow strips to form as many plaits as may be desired, the extreme ends being left in their normal uncut condition. By a peculiar process of manipulation these intermediate strips are then formed into a braid of three, five, seven or more strands, thus presenting a unique and attractive appearance.

SAFETY ATTACHMENT FOR DEMILJOHNS.—J. Lenormand, San Francisco, Cal. No. 607,935. Dated July 26, 1898. This invention has for its object to provide a means for preventing demilohns and like articles from being unlawfully removed from vehicles in which they are being carried to customers while the driver is absent delivering an order. It consists essentially of a metal wire rod or bar secured within the wicker covering of the demilohn, and a ring connected with said bar and projecting outwardly through the wicker covering in such a position that it may be engaged and locked to some fixed object. The wire or rod is laid against the demilohn and the woven or wicker-work covering is woven over the demilohn and the rod which is bent so as to enclose a greater or less portion of the demilohn. A loose ring is secured to this wire or rod and extends outwardly through the interstices of the covering, and a rod or chain can be passed through the rings of several of the demilohns and securely locked to the vehicle so that no demilohn can be removed without first unlocking and removing the rod or chain.

Recently Declared Mining Dividends.

Boston & Montana Copper Co., Montana, \$4 per share and \$1 extra; payable Aug. 25.

Swansea, Utah, \$5000; payable Aug. 10.

Gold Coin, Colo., 1 cent per share, \$10,000; July 25.

The "Blue Heat."

A critical temperature, in the working of both iron and steel, is at the so-called "blue heat," which is from 450 degrees to 600 degrees Fahr. Here, iron and steel are much more brittle when cold or at redness. This heat, however, does not seem to leave any bad effect on the iron. But if the piece be worked in this range of temperature it will retain the brittleness after cooling and show a great loss of ductility, as measured by the bending test, although it has not been conclusively proven that there is a loss of ductility when the piece is pulled apart by static tensile stress. The poorer the iron the more susceptible it is to the "blue heat." The danger to steel, at the "fatal blue," is more pronounced than in iron, but it exists, to a greater or less extent, in all grades of iron. It is also more noticeable in a descending than in an ascending heat, and is especially marked in work having sharp corners, which has been worked at the blue heat. The loss of ductility and of shock-resisting power is not due to any incipient cracks, as can be proven by the restoration of the former qualities of the metal by re-heating to redness or by annealing. There seems to be some close relation between the effects of "blue shortness" and "cold working," but the injurious effects of the former are more marked than those of the latter. While blue working lessens ductility, it is not always fatal to the metal. Examples may be cited in proof of this. In hand riveting the operator usually continues hammering while the rivet cools past this critical temperature, and yet few rivets have been known to fail from this cause alone. According to a paper recently read by Prof. H. E. Smith, before the Engineers' Club of Minneapolis, on "The Effect of Heating and Working on Iron and Steel," blue working, without subsequent annealing, is prohibited in boiler work for the United States Navy, but not for hull work.

Starting a Big Machine.

A careful engineer starting a big pumping engine goes about it in a very deliberate manner. Chief Engineer Hodge, in charge of three gigantic pumping engines at the Pittsburg, Pa., waterworks, gave a personally illustrated lecture on the subject to a visitor who happened into the plant. Turning a little wheel he said: "It takes about fifteen minutes to start one of these pumps. I am turning on a little steam to sort of warm up her jacket before she gets down to hard work. A machine is like a man in a long distance race—she has to get limbered up before she is capable of her very best work. The work this engine does when she gets down to business is to take 500 gallons of water out of the river every revolution of her driving wheel and start it on its way to the consumers. She runs at the rate of fifteen revolutions per minute, and you can easily see that she has no snap, but earns every cent of her wages." Diving down into the basement Mr. Hodge turned a valve wheel a part of the way round, and then went up stairs and turned on a little steam at the main valve. Then the ponderous driving wheel, which weighs a trifle over twenty-eight tons, began to revolve slowly. Down into the basement he went again to open the intake valve a trifle more and then up to the main steam valve to give her a little more steam. With running about, turning a little wheel here and there, several assistants also helping with the work, it was fully fifteen minutes from the time the first steam had been turned on until the big machine was running at regulation speed and doing a regulation amount of work.

A DAY is the name for the time in which the earth rotates once, and a month for the time in which the moon revolves once. Then since tidal friction retards the earth's rotation and the moon's revolution, we may state that the day and the month are now lengthening at different rates which

are calculable, although the absolute rates in time are unknown. It will suffice for a general comprehension of the problem to know that the present rate of increase of the day is much more rapid than that of the month, and that this will hold good in the future. Thus the number of rotations of the earth in the interval comprised in one revolution of the moon diminishes; or in other words, the number of days in the month diminishes, although the length of each day increases so rapidly that the month itself is longer than at present. For example, when the day shall be equal in length to two of our actual days, the month may be as long as thirty-seven of our days, and the earth will spin around only about eighteen times in the month.

How to Use a Watch as a Compass.

For the information of those who, like myself, are fond of hunting, and in their zeal apt to lose all directions in the woods, I give my method of finding my way back again. There are two requisites necessary, the sun and a pocket watch. Of course, a man who knows the four points of the compass can come out of the woods with the assistance of the sun, but with the help of his watch he can do it so much better and more exact.

If it is in the morning and you want to come out of the woods in a southern direction, take your watch, open it and

hold it in your hand face up. If the small hand points at ten o'clock, for instance—it does not make any difference where the large hand points to—set the watch so that the small hand points straight to the sun, so that the shade will be easily under the small hand. Now take the distance from X to XII, divide into equal parts, and the result is XI, which points to the direction you want to take if you want to go south. If your destination lies in a northerly direction, follow the direction given by V, the opposite of X.

If it is towards evening and you want to find your way home, place the watch so that you get the shade under the small hand, the same as in the morning. If the small hand points to IIII, divide the distance from IIII to XII around the nearest way, the result of this being II, which gives you the direction you have to go if you want to go south, the direction north being indicated by the opposite, VIII. This is one method to find your direction when you have a watch with you. Another method is given by nature itself. Look at the straight giants of the forest, and you will find that on the side where the bark is darkest the northerly winds are blowing, while on the side where the bark is light the wind blows from the south. This may not be very practical information for men who look for workshop experience, but, then, it is not fair to have all work and no play. —L. H. Avey, Plaquemine, Louisiana, in New York Blacksmith and Wheelwright.

A GERMAN inventor proposes to manufacture leather from asbestos. He will treat the fiber in a solution of caoutchouc until it is thoroughly coated, and then evaporate the dressing. The product adheres together after this treatment so tenaciously

that after pressing it can be used for all the purposes of leather. It is claimed for it that it will not expand in moisture and possesses great durability.

THE occupations of the American people are given in the bulletin of the Eleventh Census recently published. The total number of people engaged in occupations of all kinds in 1890 was 22,735,961. Of the whole number of working people the females form 17.22 per cent. Divided by classes the working people of the country are as follows: Agriculture, fisheries and mining, 9,013,336; professional, 944,333; domestic and personal service, 4,360,577; trade and transportation, 3,326,122; manufacturing and mechanical industries, 5,091,293. Over 59 per cent of the workmen are married, over 27 per cent single, over 3 per cent widowed, and one-quarter of 1 per cent divorced. In manufactures and mechanics the carpenters and joiners, numbering 611,482, make up the greatest element, with dressmakers and milliners following, with 499,690. There are a little over 1,000,000 bookkeepers, clerks and salesmen, 690,658 merchants and dealers, 5,281,557 farmers, planters and overseers, and 3,004,061 agricultural laborers, 349,592 miners, and only a little over 60,000 fishermen and oystermen. Professors and teachers, aggregating 347,344, form the most numerous of the professional classes. Physicians and surgeons, 104,805, come next; then lawyers, 89,630; clergymen, 88,203; Government officials, 79,664; musicians, etc., 62,155; engineers and surveyors, 43,239; artists and art teachers, 22,496; journalists, 21,849; and actors, 9728.

THE compound steam turbine directly coupled to a dynamo dates from 1884, according to A. C. Parsons. The first motor ran at 18,000 revolutions per minute, giving 6 H. P., but dynamos and alternators of 500 to 700 H. P. are now driven by direct coupled turbines, more than 30,000 H. P. of such machines being at work in England. The compound turbines are of two types—the "parallel flow" and the "radial flow."

In the former the steam, entering by an inlet all around the shaft, passes through successive turbines of gradually enlarging passageway, and is expanded in small part at each turbine, finally escaping to the exhaust pipe. In the radial flow type the rows of turbine blades are keyed into and project from the faces of moving disks attached to the shaft and fixed disks attached to the casing. The steam's course is outward through the rings of blades, then inward, and again outward through the blades of the succeeding disk, and so on. The bearings are specially constructed, with concentric rings that form upon the shaft thin layers of oil to serve as a cushion to prevent hammering. A power plant of this kind is economical in first cost and in maintaining, and offers other advantages.

TWO WEEKS is too long a time between advertisements. I do not think the merchant who advertises every other week is going to get anything like the advantage from advertising that the merchant who advertises every week will get, no matter how attractive the every-other-week advertisement may be made. It is the persistent, frequent advertising that is, nine times out of ten, going to get the business.—Charles F. Jones, in Printer's Ink.

ACCEPTING a check of a corporation signed by its treasurer and secretary in payment of an individual indebtedness of the said secretary and treasurer is not an uncommon occurrence. A great deal of this is done and it usually goes through all right, but unless the recipient of such a check has had a direct or an inferential assent of the corporation that the check may be so used, it is not a valid payment and a refunding of the money may be demanded, because the check, being

signed by the corporation by its officer, puts the receiver of it upon notice that the funds represented by it are corporation funds, and are not to be diverted to any private purpose without its consent.

Iron Body Angle Blow-off Valves.

Lunkenheimer's iron body blow-off valves are guaranteed by the manufacturer for working pressures up to 250 pounds to the square inch. All parts are made of iron, excepting the stem, disc-locknut, disc-plug and seat ring, which are made of bronze; the reversible bearing faces in the iron disc are filled with Babbitt metal.

Reference to the sectional illustration shows the disc solid fitting closely in the barrel of the valve shell to prevent scale and sediment from being trapped on top of disc, thereby preventing it from being readily raised

when necessary. The disc is reversible, having two valve or seating faces which can be changed at will, increasing its durability. These valve or seating faces in the disc consist of dove-tail slots, filled with Babbitt metal; when both are cut or worn out the old Babbitt can be melted out, new metal poured in the slots, and be faced off thus renewing the principal wearing parts of this valve. The brass seat ring in the body of the valve can also be renewed when cut or worn. To reverse disc remove valve bonnet, take entire trimming out of body of the valve, then unscrew small plug at bottom of disc and disc-locknut around valve-stem; the position of the disc can be reversed so as to present a perfect bearing face to the seat ring in the shell of valve.

They are made in three sizes, 2, 2½ and 3 inches, with screw, flange, or screw and flange ends. They should be connected so that the inlet is at the side. They can also be furnished made entirely of bronze, for marine purposes. They are made by the Lunkenheimer Company, Cincinnati, Ohio.

California Game Laws.

1. No antelope, elk, mountain sheep, female deer, spotted fawn, nor meat nor hides of the same; no English skylark, robin, pheasant, humming bird, thrush, canary, mocking bird, nor the nests, eggs and skins of the same, may be taken at any time.
2. No nest or eggs of any quail, duck, grouse, dove, rail, blue or white crane, shall be taken at any time. Nor may any crane be killed at any time.

The close season for game is as follows, to wit:

- Deer, from Oct. 15 to July 15.
- Dove, from Feb. 15 to July 15.
- Duck, from March 1 to Oct. 1.
- Grouse, from Feb. 15 to Sept. 1.
- Quail, mountain, from Feb. 15 to Sept. 1.
- Salmon, above tide water, Oct. 15 to Nov. 15.
- Trout, from Dec. 1 to April 1; trout, steelhead, Feb. 1 to May 1.

From County Gov't Act of 1897: 28. "To provide by ordinances not in conflict with the general laws of the State, for the protection of game, and may shorten the season for the taking or killing of fish and game, within the dates fixed by the general State laws, but shall not lengthen the same."

From Penal Code: "Every person who willfully enters upon the enclosed land of another for the purpose of hunting, or who discharges fire arms or lights campfires thereon, without permission, is guilty of a misdemeanor."

Mining Summary.

CALIFORNIA.

Amador.

At the South Eureka mine they will run a drift from the 1550-foot level, which, it is expected, will strike the ledge below the pinch encountered at the 1250 level in the north shaft. Ore is being taken out of both shafts, and the twenty stamps in the mill are steadily dropping. The mine is paying expenses of operating and a balance each month to go into the reserve fund.

Ledger: Drifting on the ledge at the Oneida continues. Supt. Truscott is having a mill test of 500 tons made at the Zella. A shaft repairing at the Zella is being pushed forward and at the same time the management is keeping ten stamps at work on ore from the mine, and five on the Oneida test run. The trial of the suits of the Argonaut Co. against the Kennedy Co. has been set for Sept. 15.

Dispatch: The Amelia shaft is down about 600 feet, and the rock continues very hard. The water is handled without difficulty. The drift from the north to the south shaft on the 2400-foot level in the Kennedy mine is being steadily driven, and connection between the two shafts will be made soon. There is talk of bringing electric power from the plant on the Mokelumne river with which to run the 40-stamp mill.

Butte.

At the Magalia mine, near Dogtown, a 10-stamp mill is running steadily on cement gravel. The face of the lower tunnel is now down the canyon 3000 feet from the mouth of the big shaft. The ancient gold-bearing channel has the same pitch or inclination that the surface channel has. It averages about 500 feet deeper than this channel, the full 3000 feet. Forty-five men are employed. The machinery, pumps and drills are run by an air compressor driven by water power. The mine is very wet, and the men in some portions of it wear two rubber coats at one time. The Little Hope mine is running steadily and twenty men are employed. The Badermine is doing well. Forty Chinamen are gravel mining at Big Bend.

H. E. Vall is prospecting extensively on the ground of P. R. Welsh, near Oroville, and will sink ten shafts. A steam pump will be used. It is understood that, if the ground is rich enough, a mining dredger will be built.

Calaveras.

It is locally reported at San Andreas that work on the Thorpe mine will be resumed shortly and also that a 30-stamp mill will be built on which work will begin early in August. The Madison mine at Angels has closed because of water shortage.

L. Vandell has bonded the Peek Ranch quartz lead and is sinking a shaft on the lead. The vein was uncovered quite a distance some years ago when the Peek Ranch Hydraulic Co. was operating in that vicinity, but no depth was reached. P. Lancel, on the McFadden Ranch, near West Point, has struck gravel which gives good yield.

F. McNear's mines, the Buckhorn and Red Gold, and the Heinsdorff property near San Andreas are closed down, but it is presumed that work will start again when water is assured.

The Melones mines near Robinson's Ferry comprise six mines. In the South Carolina the tunnel has reached 3000 feet. The development thus far is said to show 450,000 tons of ore that is valued at from \$3 to \$10 a ton and can be milled at \$3 per ton. Development work will be continued until spring, when a mill of 120 stamps will be built. B. Deleray is Supt. and W. C. Ralston Gen. Mgr.

Echo: Work will soon be resumed in the Butts mine near Angels. Unwatering the shaft has begun. There is every prospect of the Cherokee mine being operated on a large scale shortly. It is stated on good authority that the Demarest mine near Angels is making a good showing. The vein is getting wider and richer. The Utica Co. is laying in a large lot of logs for mining purposes. The company will make extensive improvements. The water ditches are to be cleaned out and enlarged, the reservoirs are to be cleaned out, and an electric power plant is talked of.

El Dorado.

The Baltic mine near Grizzly Flat has been bonded to San Francisco capitalists and operations will be commenced without delay.

Nugget: Development is pushed at the Rose Kimberly mine near Rescue. The shaft is down 150 feet; a drift on the ledge is being driven from the 150-foot level. At the Grossman mine, near Rescue, the shaft is 100 feet deep. Crosscuts have been made east and west from the 100-foot level. The ledge prospects well. At the Eagle mine at Grizzly Flat, after having blocked out a large section of good ore, the company are erecting a 10-stamp mill. They are putting in a 50 H. P. engine to run the mill. Steam will only be used, however, when water cannot be obtained. D. H. Jackson has a force employed retimbering the Gold Bug mine, near Placerville, for extensive development work.

Nugget: The Mt. Pleasant mine, at Grizzly Flats, is being unwatered and has reached 450 feet in the old shaft. The shaft is 700 feet deep and in addition there are several hundred feet of levels. It is estimated that it will take sixty days yet to finish the work. At the Grizzly gravel mine, scarcity of water has compelled closing the mill. Several men however are opening drifts and blocking out ground for the winter run. Development at the Mt. Hope continues. The company are ready to use their 10-stamp mill, recently completed, but will probably be prevented by scarcity of water. At the Eagle King the stamps have been hung up for the season for want of water. A winze is being sunk from the tunnel.

Kern.

J. Singleton has begun work on the Windy mine, near Johannesburg. This claim, which has been in litigation for some time, has been considered the richest prospect in the camp. After six months of idleness, work is to be resumed on the Val Verde mine, under Greggs & Fisher. A run of twenty-one tons of rock from the Sunshine mine, at the Red Dog mill, turned out \$3600.

Mono.

Mine: At Bodie about 15,000 tons of tailings are treated monthly at the cyanide plants—the South End, Standard, Syndicate, Victor and Sunshine. All are producing bullion. The Dunderburg is not counted, though in operation. When the Copper Mountain and Lundy plants get to work there will be an enormous lot of sand handled in Mono county. This stuff, which was considered a nuisance a few years ago, is valuable now.

Nevada.

Work at the Mary Ann mine, near Graniteville, under bond to G. Mainhart, is progressing favorably. It is locally reported that the Ormonde mine at Washington has been bonded for \$75,000. R. B. Smylington is making a survey and report upon the old Constitution mine, near Nevada City, for a company that is about to resume work on it. The Powning G. & S. M. Co. at Grass Valley appointed G. E. Mainhart Supt. The company will soon begin development of the property.

Miners are employed at the Delaware mine, near Nevada City, although the gravel has been all worked out. Not long ago a quartz ledge 2½ feet wide was found, which yields a fair prospect. Supt. Mallon believes that there is a pay chute on the vein and is prospecting it. He will sink and drift and perhaps the Delaware will turn into a dividend paying quartz mine after years of production as a gravel mine.

Fourteen more miners were drafted at the Champion mine, Nevada City. The water supply is very short, so much so that there was hardly enough power to haul the men out of the mine. As soon as the new reservoir is completed there will be a change for the better. At French Corral R. I. Thomas has secured a company of Sacramento capitalists to work his river claim, and work has begun. A flume has been built, 192 feet long, which will carry 70,000 inches of water. In a few days they will have thirty or forty men at work.

Transcript: An 8-inch pump is being put in at the Phenix mine near Nevada City. A ledge of high-grade ore has been found. Work on the new 10-stamp mill is progressing and will be in operation by the middle of August. At the Eagle Bird mine near Mayburt on account of shortage of water operations are not in full blast. However, the company have plenty of capital and are developing the mine in a systematic way.

Plumas.

The Four Hills mine, near Johnsville, has twenty men doing development work. The Jamieson mine is employing thirty-five men. The Plumas-Eureka is being worked by tributaries, who are deriving good returns for their labor. The Red Ravine Co. have struck the channel on their claim at Nelson Creek, with about 7 feet of gravel.

Riverside.

The Good Hope mine, near Perris, will be worked during the summer by contracts, and no man will be employed by the day except those in the mill and shafthouse and the firemen. The contracts will be in large sums, as the rock is hard to work. The shaft is 600 feet deep. Work will be prosecuted on the first, second, third and fourth levels.

San Bernardino.

Near San Bernardino, in the Rose mine, a new ore body has been found. It is on the seventh level, is 4 feet wide and averages \$30 a ton. About 1000 tons are being hoisted to await the rains or the finding of water, for which a well is being sunk that has reached 200 feet, when the mill will be started.

Shasta.

The Bully Hill mine near Copper City is making a carload shipment of copper ore. The Dickinson's Point mine near Whiskeytown is showing good results in the tunnel development. The Davis & Sexton astrastra is crushing a good quality of ore and saving considerable high-grade sulphurets. The Gopher mill is running steadily on ores from the Whiskeytown district. The cyanide plant being built by San Francisco people on the Toughnut mine at Dog Creek will be in operation shortly. In the Mollie mine at Dog Creek a 7-foot wide ledge has been opened by 270 feet of tunnel.

The Old Spanish M. Co., at Lower Springs, are working a force driving tunnels to tap the two largest bodies of ore. The new 10-stamp mill was started last week on a fair grade of ore.

Democrat: D. N. Fowler & Co., owners of the New Era group, on Clear creek, bonded one of their claims to Muir & Youlden. Extensive development work has begun. Hobbs & Hemsted have begun sinking on the Copper King and Copper Giant claims on Stillwater. Thus far only surface work has been done, but the ore has paid for its extraction. It shows native copper and carries gold and a high per cent of lead.

Sierra.

Reynolds & Carter have leased the Morrison hydraulic mine for five years and have begun work.

The pump was started at the Gold Bluff mine last week. Supt. Copeland expects to have the mine unwatered within three weeks. The Croesus M. Co. is putting an air plant on the Plumbago, near Alleghany. Water power is used. The compressors are

down on the river, 5000 feet from the mine. From there the air is forced through pipes, reheated, then runs the entire plant. The Croesus Co. owns over 9000 feet of the Plumbago ledge, which is a good producer.

The Mountain mine, near Sierra City, will be worked and the mill put in operation for thirty days to exploit the property by McK. Twombly of New York City, with a view to purchasing the property. Mr. Twombly has large gravel mining interests in operation in Ecuador.

Siskiyou.

The Minetta B. gravel mine near Happy Camp is using 2600 inches of water and using an elevator to carry off the tailings. Even with this disadvantage the company meets with success.

It is stated at Sawyers Bar that future operations of the Salmon River M. Co. will depend upon the success of the cleanup which they will make in a month. A find is reported from Whites Gulch, near Fort Jones, of a ledge from 2 to 3 feet wide and giving good assays.

The Salmon River Hydraulic G. M. & D. Co. at Sawyer's Bar has built seven miles of flume, which takes in all of Salmon river at that point, or about 1600 inches. Two giants are in operation, one 6 and the other 5 inches. This is the old Wm. Klein mine, that has been worked since the '50 period. The Etna advance says J. Daggett will commence operations on the lower tunnel of the Black Bear mine on a big scale. Two shafts have been sunk in the old main tunnel, and reports say that a 2 foot ledge has been discovered that will run about \$30 to the ton. The Golden Jubilee mine, at Humburg, is worked day and night with success. The ledge is about 2 feet thick and pays well.

H. Barton, in a clean-up from a week's run at Oak Bar, realized over two pounds of gold. The Eastern Co. prospecting the Yreka creek basin from below Hawkinsville to Yreka, will continue the work. The ground is all bonded for mining, to be returned after mined, while some has been contracted for purchase outright at a stipulated time if prospects are satisfactory.

Hunter & Co. of the Cherry Hill quartz mine on Cherry creek have five men at work on the lower tunnel, which is to be connected with the upper level when completed to the ledge. They will build a mill.

Machinery is being set up at the Morrison & Coburn mine in Quartz valley. All the quartz so far taken out pays well. The San Francisco company working the old Wright and Eastlick hydraulic mines at Oro Fino have received new machinery with considerable more pipe to be fitted up for the coming winter. The American Bar claim at Klamath river is reported paying well, and is worked by a large crew. The ledge has been tapped at the Katie May mine at Greenhorn. The Commodore quartz mine at Barkhouse has been sold to San Francisco and Oakland men for \$26,000.

The Big Two and Lone Lenore mines on Little Humburg, have been sold for \$10,000 to San Francisco people.

The Salmon River M. Co. working the Klein mine, have been doing well despite low water. They have about 15,000 inches at present, but ought to have double that for running the mine to its full extent. The Aromas mine near Sawyers Bar has not been operated this season for want of water, but it is in fine shape to work when water comes.

The Reeder & Brown claim in Fool's Paradise district, which paid \$10,000 the past two months, is in litigation. J. F. Boyle is receiver.

News: The Commodore, Goodenough, Insurance, Orietta and Eastern Star mines, known as the Goodenough group, last week were sold to Capt. Thos. Mein, F. J. Fletter, R. M. Mein, E. M. Wilkinson and J. A. Chestnut, representing the London Exploration Co., for \$26,000. A mill will be erected and the mines developed on an extensive scale.

Trinity.

C. B. Wingate & Co. are building a 10-stamp mill on their Chloride-Balley mine, near New River.

Tuolumne.

The App mine at Quartz has a force of men at work placing the foundation for six motors. At the Rappahannock the shaft is down 1150 feet and crosscutting at the 1100-foot mark. The Rappahannock is one of the deepest mines in the county, but the immense bodies of ore have been practically untouched.

The Horseshoe Bend & Tuolumne M. & D. Co. is developing the Stover, Shorey and Doyle property at Horseshoe Bend. The company will increase the force August 1st and push the work steadily until a drift has been run in on one of the principal veins.

A company composed of business men of Columbia have begun operations on the Stanislaus river in search of an ancient channel. A dam will be built to turn the river.

The Golden Gate and the App mines have shut down for want of water.

Banner: The lack of water has no effect on the pocket mines. In fact, it is a benefit. The pocket mines are the sources from which two-thirds of the ready money in the county come.

Tulare.

C. H. Clambes is developing a quartz property near White river. San Francisco men are building a 10-stamp mill near the same place, and considerable development is going on throughout that section.

Yuba.

Engineer Vischer of the U. S. Debris Commission has resumed work in the Narrows near Smartsville. Twelve men are engaged in making the soundings. At the Pennsylvania mine, Browns Valley, work progresses. The shaft has been unwatered 200 feet and it is thought the water will be out and stoping begun in twenty days.

NEVADA.

About thirty-five miners were laid off recently at the mines in lone. The draft was from the group in Shamrock canyon, the Cleveland being closed down. Over half the miners employed in Austin and a number of the top men were laid off, and it is not known when they will be put back. This was on account of the Farnsworth troubles.

Ore shipments for the week ending July 29 over the Eureka & Palisade Railroad amounted to 205,710 pounds from Eureka and 169,560 pounds from Hamilton and Ely. The Dexter M. Co. of Tuscarora is making preparations to put in a 195 H. P. electric plant. When completed, the company will have 195 H. P. This will give power for mill, hoisting, pumping and lighting purposes. The Magnolia of De Lamar marketed two cars of ore giving seven ounces gold and 100 ounces silver per ton.

Wadsworth Dispatch: Gold bullion is coming from the Olinghouse mines. One shipment amounted to \$2500, and W. D. Linton melted into one bar \$450 and into a second \$600. The Chinese placer miners grin when asked what they are taking out, but the stuff is quietly shipped to San Francisco and the Chinese keep on with their rockers.

Reveille: Work at the Union mine, at Austin, has been suspended, the pumps taken out and the tracking torn from the levels. The mill is running with enough ore on hand for several weeks.

OREGON.

Another strike of good ore is reported from the Red Boy mine, near Granite. It is locally reported that the Flagstaff mine, at Baker City, will resume work Aug. 15th.

Journal: At Bourne the E. & E. is working sixty men in the mine and twenty men in their 20-stamp mill. The mill is handling eighty tons of ore daily, reducing to concentrates at a ratio of 25 to 1. The mine is capable of producing almost any quantity of ore, and, while there is a big force in the mine, nearly all are doing development work. All the pay above the main adit level is practically worked out, but a big vein of arsenical pyrites has been opened through sinking, and the work of driving in on the ore from several levels is opening a source of wealth. The Columbia is taking ore from the main works to keep their mill going while the owners are developing the ore bodies, blocking out for future output and prospecting for further pay streaks. The mill is working steadily, and while the output is not increasing in quantity, the values are greater; partly because of improved methods in handling the ores and perhaps on increased values of the ores themselves.

WASHINGTON.

In the Mountain Lion mine at Republic the tunnel has reached 724 feet and has cut a ledge 8 feet wide that assays \$10 per ton. At Loomis the Golden Zone is making good progress and the company expects to block out a large amount of ore before winter, as well as to have a method of treatment decided on and a plant in place. Mr. Kingsbury is the Gen. Mgr. Work on the Palmer Mountain G. M. & T. Co.'s tunnel goes rapidly forward. At Bossburg the Young America and Cliff Con. M. Co. concentrator is finished. Modern machinery, including an air compressor, is being placed; drills will be run by electricity. There are two tunnels on the property, both about 200 feet. The ore is high grade, running well in silver and lead. There are 2000 tons on the dump.

At Republic the Little Cove is working fourteen men. Three eight-hour shifts are working the south drift. Each shift progresses about 1 foot per day. In the north drift two shifts are working, but the rock is hard and each shift makes only 6 inches per day. The San Poil tunnel is in over 400 feet.

The tunnel on the Montana Lion mine, at Republic, has reached 742 feet. The west ledge is 8 feet wide and carries average values of \$10 per ton. The owners are considering the advisability of ordering a stamp mill. The Tenderfoot & Trail Co.'s ledge is 6 feet wide. The ore assays from \$3 to \$4 per ton.

BRITISH COLUMBIA.

The Whitewater Mines, Ainsworth, have taken a working bond on the Slocan Boy for \$40,000. Work on the property will begin immediately. The Velvet at Rossland has been successfully floated in London by the New Gold Fields of B. C. as the Velvet Mines, Limited. The new company has a capital of £100,000, of which the New Gold Fields retains a large holding. J. Morrish will be in charge of the property. The development of the Velvet continues satisfactorily. In the 100-foot level some good malachite is met, which is not often found in this camp. Much good copper ore is also encountered, mixed with white quartz and black iron.

The new concentrator which the Whitewater mine in Ainsworth district is building will handle 100 tons of ore per day, and the management estimates that there is sufficient ore in sight to keep the plant going for at least two years. The mine now employs 100 men. The Payne mine, in the Slocan, last week shipped twenty-four cars of ore, and the management expects to exceed that figure in the near future.

The development of the Whitewater vein, Slocan, has been carried on through seven tunnels varying in length from 100 to 500 feet. The highest tunnel is 500 feet above the seventh, and all are connected by winzes or shafts giving ventilation to the entire mine. Because of the soft and shattered character of the formation, little blasting is necessary; but for the same reason it is imperative to support all the tunnels and drifts with timber. The present output is about thirty-five tons per day. The net value of the ore delivered at the smelter is \$55 per ton, which gives a net profit of \$40 per ton.

The Rossland ore shipments last week amounted to 1765 tons, of which the Le Roi

furnished 1925 tons, the War Eagle 700, Center Star 160. The Le Roi is shipping 265 tons a day. The shipments range about \$30 in gold, 3 per cent copper and two ounces in silver, which gives a total value as follows: Gold, \$30; copper, at 11 $\frac{1}{2}$ ¢, \$7.05; silver, at 59¢, \$1.18; total, \$38.23. From twenty assays made in the Dundee mine at Ymir the results ran from \$2.68 to \$38.57, an average of \$13.57 a ton. The shaft is 260 feet deep and there are 235 feet of tunneling. A wire tramway 1800 feet long has been completed from the mine to the site of the proposed concentrating mill. The property has been operated with steam drills, but will be changed for a 10-drill compressor. Further on a 50 H. P. hoist will be installed. The entire plant will cost over \$20,000. J. L. Parker is Gen. Mgr. In the Sloan the Last Chance is shipping 400 tons of ore. The ore houses and tunnels are full of ore taken out in developing. Six feet of clean ore was found on the Payne last week. The strike was made at 300 feet depth on the Maid of Erin claim. There are 100 men working on the Payne. Five inches of galena running 220 ounces in silver has been struck at a depth of 500 feet on the Sovereign after running a tunnel 300 feet. The Enterprise people are building a wharf at Ten Mile to accommodate the loading of ore barges. The mine is shipping 1000 tons of ore to Omaha. At Fairview representatives of the B. A. C. are inspecting mining properties with a view to purchase. The development of the Stemwinder is being pushed. Some rich ore is sacked for shipping and a large quantity of low-grade ore lies on the dump.

ALASKA.

In July the Alaska-Treadwell mine worked 19,987 tons ore and 403 tons sulphurets were treated, the latter yielding \$35,373, and the whole averaging \$3.60 per ton. The bullion product for the month was \$72,068.

THE KLONDIKE.

The steamer Manuense is down from St. Michael, Alaska, with 260 passengers and about \$150,000 in gold dust. Of passengers thirty-four were miners who had spent one winter in the mines, the remainder being those who had gone there last spring and concluded not to remain. The passengers all agreed in the statement that hundreds of men are arriving in St. Michael daily from Dawson and vicinity seeking passage to the States and that there are upward of 1000 men in that part who have lately come from coast ports and are trying to get up the river. Many are turning back after learning the conditions at Dawson and up river points. A larger part of the Manuense's passengers are returning to their homes in California, Washington and Dakota. The river steamer Monarch is reported aground about 250 miles from Dawson.

The miners report gloomy forebodings in Dawson, whence people are leaving in hundreds. The streets are filled with idle men, for work is now difficult to get, as the city is much overcrowded. The majority of the passengers of the Manuense came down the river on the river steamers J. J. Healy, Merwin, Alice and Margaret, the last to reach the mouth of the river. The Healy arrived July 20th, the day the steamer sailed southward. She left Dawson on July 12th and reports that the river is rapidly falling and many of the bars are difficult to cross. Much suffering is said to exist along the lower Yukon, many little groups of stranded miners who are without funds and provisions being seen at points along the river.

At St. Michael things are black and everything points to trouble in the near future. The passengers who went up on the steamer Progresso are in a very bad fix. The men of the commercial company refuse to allow them to go ashore, and the steamship company owning the vessel is unable to take them up the river, having lost the river steamers which were to have taken the passengers to Dawson. Many of the passengers who have funds have transhipped to some of the river steamers, but the greater number are stranded on the ocean vessel.

The beach at St. Michael is also crowded with stranded miners and those who intended to have been miners. Many who drifted down the river have not sufficient money to pay their fare south, and there they remain, waiting for something to turn up. The two commercial companies will not allow any of the ocean liners or river steamers which are not doing business in connection with them to land at their wharves. Passengers and freight on the ocean boats must be transhipped in the stream and the river steamers not connected with the company must land their passengers at points all along the shore. Among the steamers at St. Michael when the Manuense left were the Danube, which was scheduled to sail about a fortnight after the Manuense left, the Leelanaw, Progresso, Brixham and Nordenskjold. While at Dutch Harbor, which port was called at on the way down, the Manuense officers learned that the Moran fleet of river steamers from Seattle had been destroyed and were lying in piles of firewood along the barren Alaskan coast.

IDAHO.

Mining men share in the belief that this fall will be one of unusual activity in all camps of northern Idaho. This belief is, to a certain extent, being verified by the departure from Kendrick last week of Mr. Emmett with a force to begin work on the Crescent mine. Mr. Sweet had a 5-stamp mill put on the property a year ago, but has never run it steadily. The ledge is narrow and from the last runs the result was \$25 per ton, the tailings going \$9.40 per ton. The intention is to sink, run levels and open the mine on a broader scale. The Mascot M. Co. will soon be crushing ore from the old Blanket ledge. The ore is low grade, going about \$4 and \$5 per ton, with rich pockets. Other properties are being examined with a view of purchasing. The most active work is in the New-some creek and Florence districts. In New-

some creek district the mines that are worked are paying, and some fine ledges are being opened. At Florence about 100 men are employed. The Banner mine is not working a full force, as the company is sinking a shaft 100 feet deep, and will not increase its force until levels are run. The What Cheer and Blossom are looking good, and four new Huntington stamp mills will be taken into the camp by fall. At Grimes Pass the Wells Bros. are running an arrastra and crushing ore from one of their claims that turns out \$60 a ton. They cleaned up \$700 from one week's run.

Portland, Or., men have bought the Black Hawk mine at Mineral. The Eagan group has also been sold and it is locally reported that the Cuprum Smelter Co. is the purchaser.

The Bunker Hill & Sullivan tunnel at Wallace is in 2700 feet, and progress is being made at the rate of 300 feet per month. The shaft is down 400 feet and is reported to be in good ore all the way. It will be two years yet before the tunnel reaches the point of intersection.

The bond on the Lucky Boy mine at Idaho City given to Pittsburg capitalists calls for the purchase price of the mine to be paid September 1st, but the company concluded to make the payment August 1st. It is stated that a mill will soon be shipped. At the Morning Star near Grimes Pass a large mill will be put up this year on Payette river. A tramway will be built from the mine to the mill. It is said that in all about 200 men will be employed. The Morning Star tunnel taps the ledge at 700 feet depth. The tunnel is 2000 feet long. The ledge is 12 feet wide and the ore runs \$15 a ton.

UTAH.

Work has been resumed on the property of the Creole M. Co. at Park City under conditions that warrant steady work. Seven carloads of crude ore were shipped from the Horn Silver at Frisco.

The Swansea, at Silver City, is shipping from six to ten cars of ore a week. The Horn Silver mine, at Frisco, shipped six cars of concentrates. The Utah, at Fish Springs, made an ore shipment that yielded 42 per cent lead and 209 ounces silver per ton. The output of the Ophir Hill mine, at Ophir, is 1000 tons per month. The product is chiefly lead; the copper value averages 3 per cent with a fractional amount of gold.

From Silver City were shipped last week thirty-three carloads of ore. The Sampler at Park City shipped \$1,517,540 pounds of ore and concentrates.

In the Grand Central mine, at Tintic, the ore body on the 800-level is getting bigger and richer giving assurance of regular dividends for the future. The company expects to utilize electricity for its plant upon completion of Telluride Co.'s power plant in Provo canyon, and will put in a fine new hoist as soon as the electricity is available. M. Holbrook is Gen. Mgr.

The ground at the Mammoth mine, at Mammoth began to move and several cave-ins had occurred in that portion which had been furnishing the stockholders with their dividends. How serious the "movement" is was not known, but everything will be done to arrest damage. L. R. Mayne & C. H. Scheu, mining operators of Mercur West Dip, are in Wayne county, in which they are largely interested. Their properties show ore veins from 3 to 8 feet in thickness, and running from 7 to 40 per cent in copper. Engineers are making surveys and systematic development of the ground has begun. W. W. Old has secured a lease on the Rio Grande group at Tintic, and will put a shaft down 200 feet. It is stated that in the drift of the 1100-level in the Silver King workings, at Park City, another body of ore has been uncovered and that the showing is better than at any time in the history of the mine. The entire body according to report is shipping value.

The Bullion-Beck at Eureka has about 3000 tons of good ore at the surface and the shipments promise to be active. The Grand Central mine, Mammoth, shipped a trainload of ore last week. The record for July promises to exceed that of June. The Golden Star M. Co., at Gold Mountain, marketed a carload of ore which netted \$1500. A new strike is reported in the Homestake, Silver City, in the 500-foot level, the assays showing 30 per cent copper, thirty-six ounces silver and \$2 gold per ton.

Shipments from Tintic for last week were eighty-one cars of ore, ten cars of concentrates and four bars of bullion.

Mercury: It is estimated that there is about \$150,000 worth of gold in the dump at Manning, which can be saved by a second handling of tailings. A large part of the dump contains as high values as are found in some of the ore being treated at a profit in the district, and as the cost of mining and transportation would be deducted from the cost of treatment, it is evident that considerable money can be made by the company in extracting the values from what has hitherto been considered waste. From the looks of the zinc shavings in the settling tanks at the Chloride Point mill, the extraction of values is progressing favorably. It is not possible to make the same percentage of recovery that is made in the working of gold, but if the gold values and 50 per cent of the silver can be saved the company will have no occasion to be dissatisfied.

Tribune: According to reports from apparently reliable sources a controlling interest in the Valeo, at Park City has been tied by Keith & Kearns, these gentlemen, in the event that the deal is successfully carried out, getting possession of 110,000 shares in addition to their holdings. The contract, it is understood, was entered into on July 27th, the time covering a period of but twenty days. In it Pres. Johnson and others have agreed to relinquish their holdings at a reasonably good figure, and with Keith & Kearns behind it there is no reason to believe other than that

the property will be the scene of energetic development work.

MONTANA.

At Baker, last week, thirteen cars of ore were sent out, the most that has been shipped in one week for many years. The roads are now pretty good and shipments will run from ten to twenty cars a week. Among those shipped was one from the Queen Esther which ran 37 per cent in lead and thirty-five ounces in silver. This mine is under lease to Goslin, Northan & Co.

The Snowshoe mine near Libby, recently sold to an English company, has been developed by 2000 feet of tunnel. The lead averages about 5 feet in width. The ore is galena and is concentrating in its character. A 200-ton concentrator was built on the mine two years ago by a Chicago company, which did not have sufficient capital to get on a paying basis. Since the failure of the company the mine has been worked on a lease. The ore concentrates about six tons into one and a ton of concentrates runs about 60 per cent lead, twenty-five ounces in silver and \$4 in gold. The company which has bought the mine has registered in London and is composed of the directors and leading shareholders of the West Prussia Mining Co. They have been engaged in lead mining in various parts of Europe for thirty years.

The Diamond R. Mining Co. after four years of inactivity will reopen its property at Neihart. This company owns the Moulton mine on Rock creek, where it has erected a shaft house equipped with engines and other machinery of the latest model, including an air compressor and a hoist capable of sinking 1000 feet. They have sunk a three-compartment shaft 550 feet deep, operated with two cages and containing four stations, from which levels run to the vein. There is room in this mine for working a force of 200 men, and in 1892-3 an immense amount of ore was taken out. Owing to the depressed state of the silver market in 1894 the company hoisted its pumps, drew its fires and allowed the big shaft to fill with water, in which shape it has ever since stood.

J. C. Pearce & Co. near Georgetown are making satisfactory cleanups. The property comprises eighty acres of placer ground, twenty acres of dumping ground and water right of 1000 inches, sufficient to run three hydraulic machines. Shot gold is found from the grass roots down a distance of 15 feet, but bedrock has not yet been struck. Several improvements have been made at the Leonard and West Colusa mines, in the Butte district. The big air compressor has been installed and a new station is being cut at the 900 of the West Colusa. At the 1500-foot level of the East Gray Rock crosscutting is in progress.

At the Alice mine, at Walkerville, 300 men are at work. Regular shipments of silver-gold matte are made to San Francisco for refining. A force is employed at the Valdemar property of this company removing the debris from the bottom of the shaft, at 800 feet. As soon as possible work will begin for tapping a productive vein of manganese ore, which up to the present time has been worked solely from the Magma Charta.

The tailings of the old Iron Rod mill, at Iron Rod, were sold to Busch & Watson for \$2.50 per ton. They have ordered two steel tanks of a capacity of 150 tons each, which will handle that amount in the course of a three day's treatment. In addition there are vats in the old mill, which will bring the total treatment to over 100 tons a day. There are 20,000 tons of tailings in the mill yard and they carry \$10 per ton on an average. Four thousand tons must be treated this fall.

The East Pacific mine, at Winston, is to be incorporated under the laws of Maine, with head offices in Boston. It will be known as the East Pacific M. Co., and its capital stock will consist of 50,000 shares of a par value of \$10 per share. The East Pacific is employing 110 men, and it promises to make a permanent addition to the wealth of the district when tunnel No. 4, now being run to reach the ore chute at a depth of 203 feet below the No. 3 tunnel, is completed. It is 1600 feet from the mouth of the tunnel to the ore body, and half the distance has been traversed. The tunnel is being pushed forward at the rate of from 90 to 100 feet a month, and when it does encounter the ore body will give four years' work for the mine at the present rate of production beside making it possible to sink from the tunnel an indefinite depth. A 50-ton concentrator will be built at the East Pacific to handle the second-class ore, of which there are now 8000 or 10,000 tons on the dump.

Inter-Mountain: Operations at the Moonlight mine, near Butte, have been temporarily suspended, and orders given to pull the pumps. The Moonlight is the property of the Washoe Copper Co., and a large amount of money has been expended on development work since its purchase for \$760,000 two years ago. It has copper ore bodies and is considered the richest of the Washoe properties. It is understood that the property is now sufficiently opened up to produce big quantities of ore and that it will be shut down until such time as the Washoe people make arrangements for the construction of a smelting plant to treat their own ores.

WYOMING.

The Golden Eagle mine, near Grand Encampment, has twelve men at work. Two shifts are working in the tunnel which is in 350 feet and two are sinking a shaft. J. I. Cowan is Supt.

SOUTH DAKOTA.

Work on the Chicago and Two Bit, at Two Bit, is progressing. The water is under control, and the shaft is 350 feet deep and being pushed. The Great Northern has reached a depth of 235 feet. The Hardin Standard and Great Eastern will be started within thirty days. The Golden Crest has resumed sinking with three eight-hour shifts. The shaft has reached 135 feet. At Rapid City

M. H. Day will build a smelter of 240 tons capacity. The Giltedge mine will furnish 100 tons of ore a day and the balance is expected to come from custom ore.

Loung & Co., who shipped two carloads of ore to Aurora, Ill., from the Spokane mine, near Custer, received returns which netted them \$23 to the ton. They have a ledge of good milling ore, about 4 feet of which is galena running about 60 per cent lead.

MICHIGAN.

The annual report of the Calumet & Hecla M. Co. gives the following balance sheet as of April 30th, '98:

| Assets. | 1898. | 1897. |
|---|-------------|-------------|
| Cash at mine..... | \$172,988 | \$84,535 |
| Cash at New York..... | 15,000 | 15,000 |
| Cash at Boston, exchange, copper at 84¢ per lb. and mineral at 4¢ per lb..... | 6,914,696 | 6,599,428 |
| Bills receivable..... | 543,335 | 322,413 |
| Insurance fund..... | 205,650 | |
| Totals..... | \$7,851,651 | \$7,021,406 |
| Liabilities. | | |
| Drafts in transit..... | \$165,843 | \$84,354 |
| Employees' aid fund..... | 14,201 | 4,535 |
| Bills payable..... | 258,090 | 232,305 |
| Machinery contracts..... | 855,000 | 562,000 |
| Aid, hospital and insurance funds..... | | 249,000 |
| Totals..... | \$1,293,134 | \$1,132,194 |
| Balance of assets..... | 6,558,456 | 5,889,212 |

The annual meeting of the company will be held in Boston on the 17th inst. In his annual report President Agassiz says: "During the past fiscal years we produced mineral equal to 41,960 tons of refined copper; our product in refined copper was 45,194 tons. For the previous year our refined copper product was 46,237 tons. The price of copper has varied from 11 to 12 cents per pound. It should be stated to the stockholders that the gradual increase of our surplus since 1890, and the larger dividends paid during the past two years, while due in part to the higher price of copper, have been due mainly to the gradual increase of our working force. This is now about twice what it was in 1890. We are increasing the product of the mine, obtaining about the same profit per pound of copper as with a small output.

"The number of men engaged in pushing our openings has continued large, and our reserves have materially increased during the past year. The amount of dead work carried on in unproductive parts of the mine is large, and must of necessity remain so. The shafts Nos. 13, 14 and 15 sinking on the Osceola amygdaloid have been equipped with small hoisting engines. They have now reached a depth of over 400 feet, and Nos. 13 and 15 have developed some promising ground. At the south end of the mine the sinking of No. 12 has been continued, but there has been no improvement in the character of the conglomerate lode. At the north end the quality of the rock in some of the openings is not up to the general average.

"The delays incident to the completion of the larger hoisting engines at the Red Jacket shaft have been greater than we anticipated. We have only been able thus far to use the sinking engines. This has greatly interfered with our openings in the vicinity of Red Jacket shaft.

"We have laid the foundation of another large coal dock of a capacity of 100,000 tons, with a depth of water of over 21 feet along the face of the dock at Torch lake. We hope during the coming season to finish the dredging of our canal from Bootjack bay to Torch lake. We shall then have a depth of 20 feet and a base of 90 feet along its whole length, enabling us to bring the largest vessels navigating the lakes to our docks.

"At the mills all the buildings are now protected with iron sheeting, and we are obtaining an abundant supply of water for our boilers from the wells sunk in our sand flats. We have also built a new carpenter shop at the mills. We are continuing at the mills our experiments relating to greater economy in stamping and washing our rock and in treating our mineral product.

"At Buffalo we have purchased an additional frontage on Niagara river of about 200 feet; otherwise there have been no changes of importance at the Lake Linden or the Buffalo Smelting Works. At Torch lake we have begun to smelt the mineral of the Quincy Mining Co. for the temporary accommodation of that company.

"The expenditures on account of the Aid Fund for the fiscal year amounted to \$51,796.73. In view of the prosperous business of the company we have determined to pay during the coming year the contributions of the men to the fund. The value of the Aid Fund at cost is \$132,966.68."

ALABAMA.

The Alabama State Mine Inspector estimates the coal output in Alabama for this year at 6,000,000 tons against 5,898,771 tons in '97.

COLORADO.

(Special Correspondence).—E. F. Palmer of Denver has given a two-year lease and bond on ten partially developed mining claims at Winfield, Chaffee county, to Cleveland, Ohio, parties, the amount of the bond being \$20,000. The lessees expect to erect a concentrating mill on the property this year.

BOULDER COUNTY.

The old Smuggler mill, at Ballarat, started June 27 to work the dump which has been accumulating for twenty-five years and contains nearly 30,000 tons of low grade ore. The mill has a capacity of twenty-five tons per day. The mill has done good work notwithstanding the old-fashioned 500-pound stamps. The ore is a mixture of sulphides and tellurides, but the saving has been close. The concentrated product runs about eighteen ounces in gold per ton, and the crude ore concentrates from fifty to sixty to one. The mine is soon to be unwatered, put in repair and worked on the

leasing system. It has not been worked for several years.

The Elkton mining claim, owned by Morgan & Co., has been leased to Miller & Crowley for \$5000 for two years at 15 per cent royalty.

J. H. Dubois paid \$13,000 for a bond and lease of Kestler's group of mines near Gold Hill.

The shaft of the Newmarket mine, Ward district, is down 505 feet and good pyritic ore is being hoisted. One piece weighed 720 pounds. It has cost one year's work to bring the mine to its present condition and open the ore bodies.

The lessees of the Lady Franklin mine, Magnolia, shipped 651 tons of three-ounce ore during their lease, besides the high-grade stuff. They have made good wages.

The Culbertson Milling Co., near Boulder, has contracted with the Big Five for all the ore it can produce and ship. The mill guarantees a saving of 90 per cent of the values contained in the stock and tested by assay.

CHAFFEE COUNTY.

A twenty-five-ton shipment was made from the Prairie mine, near Whitehorn, that will average \$75 per ton.

CLEAR CREEK COUNTY.

In the Lamartine mine, near Idaho Springs, 100 miners are at work. The ore body is independent of the old Lamartine mine and is on the crown vein, which is gold producing, whilst the former was mostly silver.

EL PASO COUNTY.

From the Gold Hill properties of the Moon-Anchor Co. 180 tons of ore were shipped last week, of this 120 tons was smelting and sixty tons mill ore.—The Elkton is sending out sixty tons a day. Of this fifty tons is mill ore, worth about \$35 a ton. The remainder is smelting grade.

Keith & Grube at Victor are shipping twenty tons daily from their lease on the Victorator. The ore runs from \$30 to \$60 a ton.—On the Christmas Moore & Johnson are saving high-grade sylvanite ore from the 180-foot level. They have reached a depth of 300 feet.—A carload shipment of two-ounce ore was made by Crow & Clark from their lease on the Los Angeles.—The lessees on the Crozier shaft of the St. Thomas have opened up 18 inches of sylvanite quartz.

The richest ore taken out of the Gold Coin mine, Cripple Creek, is being taken from the 400-foot level, the greatest depth obtained in the mine. They keep up the 100 tons daily shipment, with improvement in the average grade of the ore.—One week's shipments from the Moon-Anchor Co.'s properties, Cripple Creek, amounted to 170 tons. Of this 60 tons was mill ore and the rest was consigned to the smelters. The statement of the Moon-Anchor under the new system of quarterly dividends has been issued by Gen. Mgr. McKinnle, who says that though extraordinary expenses have been incurred, amounting to an increase of over \$40,000, yet it has been almost met by excess production for the quarter. The cash on hand is \$119,657.73, which, with ore in process of settlement, amounts to \$136,157.73, against which charging the current dividend and operating expenses for July leaves a net cash surplus of \$81,157.73.—The Victor is shipping more ore than any other mine in the district. The greater portion of the Victor is third-class mineral that runs from \$20 to \$25 per ton. The June tonnage from the mine was 4000 and for July 4500. Only a few carloads so far of first-class, good for \$250 per ton, have been marketed, but every few days a carload of second grade is sent out that runs from \$75 to \$100. The shaft has reached a depth of 790 feet and will be continued 50 feet deeper. The next quarterly dividend will be not less than \$50,000. The Victor has paid nearly \$1,000,000 dividends. There is now more ore in sight than at any time in the history of the mine. The directors have purchased fifty freight cars, capable of carrying twenty-five tons each, which are rented to the Florence & Cripple Creek Railroad to be used only in the transfer of Victor ore to the mills and smelters.—The Hull City placer at Victor has 300 men working on its various leases. The July output was \$80,000, on which the royalty is 25 per cent.—The Newell tunnel, Cripple Creek, at 1000 feet out a vein 20 feet wide, which assays from \$10 to \$15 a ton.—In June the Legal Tender of the Golden Cycle Co. output 1900 tons. The output is now 70 tons a day and the total for July reached 2000 tons. The vein has been opened up at the 600-foot level.

Twenty tons a day is the output of the Granite mine, Cripple Creek. The ore comes from a depth of 700 feet, at which point the ore shoot is 5 feet wide and averages \$30 a ton.

GILPIN COUNTY.

The First Centennial mine, near Central City, is making a daily shipment averaging fifty tons and the ore is running a little over four ounces gold per cord. The work of sinking is going on steadily, to keep development ahead before exhausting the ore bodies in the upper part of the mine. The property is being handled by the '96 G. M. & Co.

LAKE COUNTY.

The lessees operating the Wolfstone mine at Leadville are making daily shipments of 125 tons of iron sulphide ore, running in gold, silver and iron excess. The property is worked down to 1250 feet.

The Maid of Erin Silver Mines Co., at Leadville, is shipping 3000 tons per month from six shafts. This consists of copper-iron, lead sulphides, lead carbonates and oxide iron ore. All the 10 per cent lead carrying iron excess is mined at a profit. Operations are carried on above the 700-foot level.—The Resurrection G. M. Co. is hoisting 140 tons daily from the 900-foot shaft. Two leases on the New Years and Ella incline are shipping forty tons daily.

At Leadville the Pyrennes has reached the ore bodies at a depth of 1200 feet. The Mab has finished sinking and is drifting at a similar depth.—The Mahala is opening up its

drifts at a depth of nearly 1200 feet—workings which, it has been proven by the diamond drill, are richer and larger than any of the ore bodies operated on the upper levels. In the same territory the Small Hopes M. Co., through its Marion shaft, operating this and adjoining territory, is one of the biggest sulphide shippers in the camp at a depth of 1350 feet, where good ore bodies have been opened, and are producing 200 tons of sulphide per day.—For several years work has been going on at the Yak tunnel, which has reached nearly 700 feet, cutting through some fine silver mining territory, and when completed it will have passed through Breece hill ore deposits, striking the Forest Queen shaft at a depth of 1300 feet.

OURAY COUNTY.

The Silver Queen ore at Ouray is bismuth silver, and sample runs give returns of from 800 to 800 ounces to the ton. The rock also carries some gold. There is a 16-inch streak of ore.

SAN JUAN COUNTY.

The Arabian Boy mine, near Silver Lake, after years of idleness has resumed work and a vein of high-grade ore has been found.

Seven to ten tons of milling ore from the Dives-Shenandoah, near Silverton, is shipped daily. Besides this, two carloads of first-class mineral go out to Durango weekly from the property.—From one of G. Lacey's properties in Ice Lake basin there was shipped to the smelters fourteen tons of 70 per cent lead ore carrying thirty ounces silver and one-eighth ounce gold to the ton.—D. Lloyd is making regular shipments from the old Aspen property to the smelter.—O. Lockhart has opened a wide streak of ore in Maggie gulch that averages .14 gold and sixty-eight ounces silver per ton.

SAN MIGUEL COUNTY.

The Liberty Bell mine, near Telluride, is building a tramway from Cornet basin, 11,000 feet to a point where ground is being broken for a fifty-ton mill. A long crosscut tunnel is also projected to cut the vein about midway between the mill and the present workings of the mine. Fifty men are employed.

The Pennsylvania tunnel at Telluride has reached 1060 feet, which, when finished, will be 10,000 feet long, following a good part of the distance the Pennsylvania vein, and cutting the Smuggler-Union 600 feet below its present workings.

The Tom Boy mill, at Telluride, is disposing of 175 to 225 tons of ore daily, yet there is a smaller number of men working in the mine than ever before—the result of a recent widening of the vein and the completion of heavy development work. The lead carries from 10 to 16 feet of ore. The expense for developing for a number of years will be light. The vein is intersected at a depth of 450 feet below the lowest of the upper workings by the mill tunnel crosscut which is about 2100 feet in length. It is said the property is outputting \$90,000 in gold per month at an expense of less than 25 cents on the dollar, and it is believed that these figures are conservative.

In the Silver Pick mine, Mt. Wilson district, 110 men are employed. The ore in the lower levels is improving in value, on the seventh level it proves high grade.—The Japan concentrating plant, near Telluride, the daily output is about twenty tons, or two carloads of concentrates, which average \$100 per ton in gold, silver and lead, the percentage in the latter metal being large. The tailings from the Tom Boy mill are run through a canvas plant. Development is in progress in the Japan mine and large ore reserves are being blocked out. The pay streak varies from 12 to 18 inches wide and is uniform in size and value. In addition to the ore put through the mill, several cars of high grade mineral are shipped to smelters weekly, and this is said to net from \$750 to \$1000 per car.

SUMMIT COUNTY.

J. W. Breene is shipping 200 tons of sulphides daily from the Colonel Sellers mine at Kokomo. Since the curtailment in the production of sulphides in Leadville the valley smelters are making up the Leadville deficit from Kokomo.

NEW MEXICO.

The Cochiti G. M. Co., operating the Albe-marle group near Bland, N. M., has completed a steel mill and cyanide plant at a cost of \$300,000. The present capacity of the mill is 125 tons every twenty-four hours, allowing an increase of 200 tons. The water supply is conveyed by pipe line five and one-half miles to two tanks of a combined capacity of 400,000 gallons.

S. S. Davidson, lessee of the Golden Giant mine, Pinos Altos, has struck the ore chute on the 400-foot level. It is believed the ore chute is 300 feet long on the vein in which the rich ore extends. The mill will be started within a few days.—Dodd & Bell have leased the Humboldt mine, at Hazover, and started development of the property.—Nelson Bros. have purchased a three-fourths interest in the Willis mine and are at work upon a good showing of copper ore.—The Confidence mine at Mogollon, under the management of H. H. Price, has eighty men at work, and the 30-stamp mill is steadily producing silver bullion, which contains a large percentage of gold with the silver values. Now that litigation has decided that the Eberle property is owned by F. X. Eberle, he will put in a plant for the reduction of the ores of the Eberle, Clifton and other properties which he owns. Two men are employed in preliminary examinations and work upon the mill will soon begin.—The Old Abe mine, at White Oaks, is producing good ore below the 900-foot level. An ore body was struck that runs as high as \$350 to the ton.

ARIZONA.

The workings of the Franco-American Co. at Oro Blanco is in solid ore of good character. The company is doing considerable work and

is satisfied with the condition of the mine.

From the Hardshell mine, near Crittenden, three carloads shipped recently to El Paso made good returns. Ore in the mine is becoming richer. This richness has led to trouble with the Mexican miners employed on the property. For some time past the superintendent suspected that everything was not as it should be, so he discharged a number of the men; but as the stealing continued, he was obliged to discharge the whole lot.—In Table Mountain copper camp the company has one 42 inch smelter in blast and will blow in another stack of the same size as soon as some needed repairs are finished. There are upwards of 20,000 tons of good grade copper ore sprinkled with fine gold on the dumps and 125,000 tons of \$12 milling ore. Grading for a large gold mill will be commenced in a few days. A shaft has been started and an air compressor and machine drills will soon be put in.—The Johnson mine, near Stanton, has been bonded to Eastern capitalists and work has begun on the property.—G. W. Crowe is shipping ore from the mines in Josephine canyon, which he is working under bond. The ore comes into Crittenden and is shipped thence to smelters in Colorado.—The June returns of ore shipments from the Gold Bonanza in the Baboquivari were \$1850, and a recent shipment shows by receipt \$900 gold to the ton. Ore running below \$200 remains on the dump.—The steam wagon brought the first consignment of ore from Williams to the smelter from the Grand Canyon copper mines. The load weighed about forty tons. A new strike has been made in the Nellis group of mines and a large body of ore is being uncovered.—The owners of the Marcus mine, near Stanton, will soon resume work.—At a depth of 175 feet the West Oro Bonito claim in the Bradshaw mountains shows a ledge of 6 feet. While the ore is mineralized the entire width of the ledge, there are 2 feet of it in which the ore is reported rich.

G. A. Treadwell has bonded the Cliff mine and six adjoining claims near Jerome and begun developing the property.

The Diamond Joe mine in Mohave county has been bonded to J. T. Pendegast, who will continue development of the property.—Eight carloads of ore were shipped from Kingman in July.—A 20-stamp mill will be built at the Yellow Dog mine, near Yuma.

The Commonwealth Co., at Pearce, will build a 20-stamp mill which with the capacity of their mill now running, will increase the treatment of ores to over 100 tons per day. This does not include the ore shipments daily to the smelters.

Tucson Star: The Saginaw M. Co. has secured an option on the Twin Buttes mines, near Tucson. These are copper properties. Strikes of large bodies of ore are reported made during the week in the Saginaw.

LOWER CALIFORNIA.

The Santa Rosalia copper mine, El Boleo, produces about 1000 tons of copper monthly, and is working 2000 native miners, paying them 25 cents a day in Mexican silver. They ship copper direct to London, where it brings \$260 a ton.

MEXICO.

J. F. Flynn, a northern Mexico mining man, says the mining industry in Mexico has been particularly prosperous during the past five years. Silver mining has held its own, while gold, copper and lead mining has been greatly benefited by the fall in the price of silver. The greatest development in silver-lead mining has taken place in the States of Nuevo Leon, Coahuila, Chihuahua and Durango. Monterey has shown the greatest increase in production. Very large bodies of silver-lead fluxing ore have been discovered there and the production has increased from about 1000 tons per annum ten years ago to over 100,000 tons per annum at the present time. The silver output in the State of Durango is increasing rapidly, and gold and copper mines are also developing favorably there. The Avino mines in that State have just been sold to a wealthy London syndicate and several American companies have made purchases of good mines in the same district. Extensive reduction works will be erected immediately at Avino. At present the States of Guerrero and Michoacan are attracting the attention of mining men. The Ingauran copper mines have just been acquired by the Rothschilds for a consideration of \$6,500,000. A railroad about 150 miles long will be constructed from the coast of Sihuantejo to the mines, a reduction works of 2500 tons daily capacity will be established as soon as possible. These mines are situated in what is known to be the richest copper and gold district in the republic, but lack of transportation has prevented its development. There are now two railroads heading for the district, one to be built by the Rothschilds, which will run from the coast to the mines, and another by the Mexico, Cuernavaca & Pacific, which already has about 500 kilometers constructed and will run from the City of Mexico to the Pacific.

The American G. M. Co. of St. Louis, Mo., operating in Colorado, have bought the San Sebastian silver, lead and copper mines of Charcos through W. C. Weisberg, president of the company. It is stated that a fifty-ton concentrator will be built at San Luis Potosi for treating the San Sebastian ores.

The mines of San Luis Potosi last year produced gold and silver to the value of \$4,600,000, being \$1,300,000 more than the product of the previous year.

Mexicans have been miners for centuries, in the older fields at least. The practice is primitive, but is particularly suited to the conditions of their work. The principal mines are located at an elevation of 6000 to 8000 feet above sea level, where fuel and timber are scarce; but, while fuel is costly, forage is cheap and it costs only \$1.50 a week to keep a mule, hence mule and horse power replace steam wherever possible. The old method of unwatering mines is curious. All workings below water level drain into a central sump

and above this is fixed a barrel, and from this there runs an endless string of buckets which dip into the water and discharge into another reservoir 30 feet or so above the lower one. The barrel is revolved through gearing turned by a mule. A succession of these reservoirs and trains of buckets brings the water to the surface. This clumsy arrangement, although superseded to a large extent in mines, is still employed for wells and irrigation. Mexican miners form a distinct, aristocratic caste, looking down upon rancheros and agriculturists with contempt. The miner is easily worth \$1 a day and is much more independent, while the best farm laborer does not earn more than 25 cents. Three classes of laborers are employed—underground miners proper, laborers who clear out the workings after the blasting and packers who carry the material to the shaft. Skilled miners work in gangs of eight each and are paid by contract, each gang having a captain, who is responsible to the engineer of the mine only. These contractors furnish their own supplies excepting their drills, which are weighed at intervals and the wear charged against the gang. A drift of two yards square cost from \$25 to \$40 per yard, but the contractors do not remove the broken material, which is done by the laborers, who receive from 50 to 75 cents per day. These laborers also roughly sort the ore for the packers, who sack it before carrying it to the shaft. These packers are paid by the sack, according to weight and distance traversed. They carry 150 pounds up the steep winzes, earning from 75 cents to \$1 per day. Ore chutes and tramways in the levels are not used to the extent they should be; and, although there is never any difficulty in getting sufficient ore broken down, want of labor often causes much vexatious delay in bringing it to the surface. A cheaper way of working is to let a mine out in section to buscones or tributers. Each party then has so many feet along the vein or an end to drive. They pay all their expenses and are entitled to half the ore they bring out. Rock drills and air compressors are coming into use; but on account of the cost of fuel, the more primitive methods are often better. In fairly hard ground a gang of Mexicans will drive from three to four yards per week at a cost of from \$30 to \$40 per yard. Two air drills will accomplish ten yards per week each, but each yard will cost from \$30 to \$100, half of the expense of the machine work being due to the fuel and repairs. Another difficulty in using machines is the inability of the native miners to work them, and skilled drillers have to be imported.

J. R. Magruder of New York is building a smelter at Hermosillo, Sonora. Three carloads of machinery are on the ground and work has begun.

The official report of the Batopilas mine, Alexander Shepherd's property, for the year 1896-7 has been published. The total workings for these years was 23,700 feet and ore to the amount of 43,807,612 pounds was taken out, valued at \$907,626, Mexican money, of which \$690,595 was in silver bars. The expenses were \$1,360,522, showing a deficit of \$452,896. The debt of the company is \$681,347, Mexican, and \$369,997 gold, unfunded, and 6 per cent bonds for \$459,700. The Porfirio Diaz tunnel is in 6069 feet and advancing at the rate of 100 feet a month. In 550 feet more it will cut the Todos Santos vein, and the Roncesvalles 360 feet farther on, which will reduce the cost of working these veins. The company is doing its own casting and proposes to increase its milling facilities.

The American M. Co. at El Oro is putting up a 100-stamp mill and sinking two more shafts, with good prospects.—Detroit and Milwaukee capitalists have formed the Detroit & Mexican S. & R. Co., and bought for \$100,000 mining properties at Sultepec, to be worked on an extensive scale. A smelter to cost over \$100,000 is to be erected and connected with the mine by a ropeway two and a half miles in length. H. E. Emmons of Detroit is president of the company.—In the Matehuala district of San Luis Potosi the Santa Fe mine, which has been in a bad condition for seven years, is again beginning to pay. The Santa Maria de la Paz is turning out good ore. The Nuevo Paz and Esmeralda yield good results and the Tolino, Santo Nino, Graciera, Nueva Alianza and Humboldt are doing well. The Dolores is taking out ore of medium grade.

Oasis: It is credibly reported that all the shareholders in the Don Ignacio mine at Minas Prietas have signified their willingness to join in the sale of that property, and have given a bond for the property, to sell the same within six months, to the Colorado-Creston Co.—The output of six mining companies operating in the Sierra Mojada, Coahuila, amounted during the last month to 9690 metric tons, valued at \$355,005, on which were levied State taxes to the amount of \$7100 and Federal taxes amounting to \$2130.68. The highest grade ore comes from the Buena-ventura, belonging to the La Constancia Co., which yielded on an average \$58.53 per ton.

TURKEY.

The Ministry of Agriculture, Mines and Forests of the Turkish empire has issued the following statement showing the average annual production of the mines of the empire. The quantities are in metric tons, and this, so far as known, is the first official statement made of the mineral production of Turkey:

| | |
|--------------------------|--------|
| Chrome ore..... | 35,500 |
| Manganese ore..... | 55,300 |
| Emery..... | 12,500 |
| Arsenic..... | 550 |
| Antimony..... | 2,300 |
| Copper ore..... | 10,000 |
| Zinc..... | 1,400 |
| Galena..... | 1,650 |
| Argentiferous lead..... | 9,500 |
| Lead..... | 2,500 |
| Gold and silver ore..... | 15 |
| Quicksilver..... | 2 |
| Boracide..... | 16,800 |
| Borax..... | 3,000 |
| Sulphur..... | 500 |
| Lignite..... | 15,000 |

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.

MAKE THIS SMALL

DOUBLE CYLINDER SINGLE DRUM HOIST

For Prospecting Purposes
or Underground Work,
USING COMPRESSED AIR.

HOIST FOR PROSPECTING.

The entire hoist is self-contained, being mounted on an iron sole plate or bed which carries all the operating levers and provides a footboard for the operator. The engines are provided with reversible link motion and the drum with a broad strap brake, insuring safe and rapid work.

The general lines upon which this hoist is designed are neat, strong and substantial and all the operating parts are conveniently arranged.

The size herewith illustrated is the 4 in. x 10 in., rated at 15 horse power. The larger sizes, 8 in. x 12 in. and upwards are provided with post brakes.

THE GUTTA PERCHA AND RUBBER M'FG CO.

30 and 32 FREMONT ST., SAN FRANCISCO.

Spadone's Concentrator Belts. Patented.

The "SPADONE" Curved Edge Concentrator Belt is attracting much attention among mining men, its merits appealing to the millman of practical experience.

Illustration (Fig. 1.) shows a cross-section, and (Fig. 2.) shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. We avoid this Mechanical Defect by our Spadone Curved Edge Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

FIG. 1.

FIG. 2.

We shall be pleased to quote you also on Water, Air Drill, Steam, Suction and Fire HOSE, RUBBER BELTING and RUBBER PACKING. Correspondence Solicited.

A REVOLUTION IN FREIGHTING.

THESE WAGONS ARE ESPECIALLY ADAPTED FOR STEAM FREIGHTING; CAPACITY OF TRAIN 50 TONS.

"The Daniel Best" 50-Horse Power Traction Engine.

The most powerful and only Successful and Practicable Road Engine in the World. Over sixty of them in use in this State, and they are being Successfully and Profitably Employed in Hauling Logs Lumber, Ore, Salt, Borax and other kinds of freight.

The work is being done **FIFTY PER CENT** Cheaper than it is possible to do with Animal Power. They can be operated over any ordinary road where it is practicable to use mules or horses, doing the same work. They can ascend or descend grades as much as 20 to 30 inches to the rod, hauling their loads of 35 to 40 tons, depending upon the condition of the roads; loads may be increased to even greater amount on moderately level roads.

Send for descriptive Circulars and price List of Wagons and Engine. We solicit correspondence. No trouble to answer questions. Estimates made for complete Steam Freighting Outfits. Address

THE BEST MANUFACTURING CO., SAN LEANDRO, CAL., U. S. A.

Be Sure You Get
THE GENUINE FRUE
VANNER.

SUPERIOR TO ALL IMITATIONS.

You do not know what is best in
CRUSHERS unless you have used our

Comet Adjustable.

It is easily in advance of other gyratories, which lack its range of adjustment for wear and change in size of product. Our new heavy design is also superior in proportions to that of any competing machine. Its good qualities are evidenced by largely increased sales and expressions of satisfaction from customers.

All patent claims by other parties affecting the Comet Crusher have been put to rest by the final decision of the highest courts.

General Agents for
FRASER & CHALMERS, Improved GREEN Blowers.

See those wires -- how they interlock? Note the smooth surface also.
No displacement of wires in any event. Gives three times the service of other cables, and adds correspondingly to the life of the rolling stock.

Students can enter at any time. Pupils receive individual instruction. Twenty teachers. Moderate charges. Write for Catalogue and Journal.

PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U.S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U.S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & Co.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U.S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

The Pelton Water Wheel Company

Gives exclusive attention to the development and utilization of water powers by the most modern, economic and improved methods.

An experience of more than fifteen years, involving both the theory and practice of hydraulic engineering as relates to power development in its widest range of application, is at the service of its customers.

**Nine Thousand
Wheels
Now Running,**

Aggregating some 700,000 H. P.

ELECTRIC POWER TRANSMISSION.

Pelton wheels afford the most reliable and efficient power for such service and are running the majority of stations of this character in the United States, as well as most foreign countries. Highest efficiency and absolute regulation guaranteed under the most extreme variations of load.

The Pelton Water Wheel Company,
121 AND 123 MAIN STREET, SAN FRANCISCO, CAL.

MARSH STEAM PUMPS.

SINKING AND STATION PUMPS

For Mines.

**BOILER FEEDERS,
Deep Well, Tank and Vacuum Pumps.**

The MARSH SINKING PUMPS are Superior in the Following Points:

- First—Compactness.
- Second—Strength of parts.
- Third—Fast speed, quiet action.
- Fourth—No throttle valve necessary in exhaust pipe.
- Fifth—Steam valve self-governing; will not race or pound if water gives out with steam valve wide open.
- Sixth—All moving parts can be covered and protected from falling dirt.
- Seventh—No packed joint between chamber and pump to give out and need renewing.
- Eighth—Exhaust can be turned into suction.
- Ninth—All parts easily accessible and fewer than in any other pump.

LUMBER.—Retail: Pine, ordinary sizes, \$17@18.50; redwood, No. 1, \$18@20; No. 2, \$16@18.

In addition to the war tax decisions published in this column last week, the following are considered of interest:

A person has to place a stamp on an order for cash drawn on a merchant by one of his customers.

Real estate mortgage notes require to be stamped in addition to the stamp placed on the mortgage.

In cases of loans on real estate, where promissory notes are given, which are not paid at maturity, but on which an extension of time is granted, without the taking of a new note, it is held that every such extension is a renewal of the note within the meaning of the statute, and that the requisite stamp must be affixed for every such renewal or extension.

All checks drawn by officers of States, counties and municipalities for the discharge of the obligations of the States, counties and municipalities are exempt from stamp taxes.

The person who signs and issues a bank check without affixing the proper stamp becomes involved in liability unless it is shown that he had no design to evade the payment of the stamp tax, and that the stamp was affixed and canceled at the bank before payment.

A bank may remedy the defect of an unstamped check by affixing the stamp itself, otherwise it becomes liable to the penalty under the law.

The term "certificates of any description not otherwise specified in this Act, but which are required by law," has caused more inquiries than any other one matter. It is ruled that in order to subject any given certificate to tax it must be a certificate required by some municipal, State or national law. Certificates in the exercise of State, municipal or governmental functions are exempt; but when an officer gives a certificate on his own private business it is subject to tax.

Baggage forwarded by railroad company or express, subject to extra charges, comes within the law requiring a stamp on bill of lading.

As to mortgages, it is the general principle that a mortgage is not valid unless admitted to registration. No mortgage should be admitted to registration without the proper stamp affixed.

An original lease requires a stamp. No stamp is required for copies of the lease issued at the same time as the lease.

Reports of earnings and dividends do not require stamps.

Bonds given by persons appointed by the court, such as guardians, receivers, assignees, executors, are taxable.

There is no tax on the bill of sale of a vessel.

In regard to the cancellation of stamps, which is required by law, it is held that cancellation by initials and the date is sufficient. This cancellation may be by writing or imprinting with a hand-stamp.

Old stamps issued under repealed acts can not be used in lieu of stamps required by the present law.

Placer Miners' Attention

Is called to the fact that we are purchasers of

OSM-IRIDIUM

In lots of one ounce and upwards.

Commercial Paragraphs.

F. D. WALLAKER, Denver manager for Warren Webster & Co., states that he is receiving numerous inquiries from mill owners for the application of the Webster system of heating this season.

The Colorado Iron Works Company are working their plant to its full capacity and making shipments to nearly all parts of the world. Among recent shipments were two 42x144 silver-lead smelting furnaces, with complete equipments, to the Tasmanian Smelting Co., located on the island of Tasmania. This order filled six cars. This company is also building a 42x144 silver-lead smelting furnace for the Hanauer Smelting Co. of Utah, and a 45x144 silver-lead smelting furnace for the Germania Lead Works, Salt Lake City, Utah; both with complete smelting equipments; a large jacket smelting furnace for the Canadian Pacific R. R., British Columbia; one for the Great National Mexican Central Smelting Co., Old Mexico, and one for the Mountain Copper Co., in California. This firm has gotten a reputation for its smelting furnaces because of superior design, workmanship and material, which brings orders from all over the world.

WANTED.

Partner in Extensive Placer and Quartz Mines. Free wood and water. JAMES ARTHUR, Cornucopia, Union Co., Oregon.

Wanted by Sept. 1st an Experienced Assayer and Retort Man.

Daily assays and mine books to keep for ten-stamp mill, one day from San Francisco. Pay \$75 per month. Address, with references and experience, R. A. B., care this office.

Experienced Chemist, Assayer and Cyanide Operator

DESIRES ENGAGEMENT. Has had charge of cyanide plant where segregated slime and slimy material have been worked to high percentage of gold value at small cost. References. Address P. K., this office.

Bargain for Sale.

New Complete Mine Machinery Outfit, Including No. 3 Merrill Mill, Rock Breaker, Ore Feeder, Etc.

E. A. HOLMAN, 906 Broadway, Oakland, Cal.

A GOLD MINE

Seven Miles from R. R. 10 to 15-Foot Vein of Soft Ore, \$7 to \$8 Per Ton.

A half interest will be given to a responsible person for some development and a mill that will successfully treat the ore.

B. F. WILSON, Battle Mountain, Nevada.

MINE FOR SALE OR BOND.

21 and 23 FREMONT STREET, SAN FRANCISCO, CAL.

LICENSEE FOR THE MANUFACTURE AND SALE OF

THE Huntington Centrifugal Roller Quartz Mill, Ropp Straight Line Furnace

—FOR—
Roasting, Chlorinating and Desulphurizing Ores.

Paul Ball Mill.

Simmons Ball Bearing Hydraulic Mining Giants.

WE CARRY IN STOCK

Horizontal, Vertical and Portable Engines and Boilers,
Rock Breakers, Cornish Rolls, Pulverizers, Concentrators, Ore Feeders,
Hoisting Engines, Horse Power Hoisting Whims, Water Wheels, Steam Pumps, Ore
Cars, Wire Rope, Ore Buckets, Water Buckets, Skips,
Blowers and Exhaust Fans, Shafting and Pulleys, Belting, Oils and Mine Supplies.

SOLE AGENT FOR THE

Ingersoll-Sergeant Air Compressors and Rock Drills, Manganese Steel Shoes and Dies.

Estimates Furnished for Complete Plants for Hoisting Works, Smelters, Concentrators and Stamp Mills.

The Huntington Mill is so well and favorably known among mining men throughout the world that any description of it would seem superfluous. They are in use in the United States, Canada, Mexico, Central and South America, Australia, China, Japan and South Africa—in fact, wherever mines exist, and have given the best satisfaction of all quartz-crushing mills. The construction of this Mill has lately been much improved and we claim it to be the cheapest, most efficient, simplest and most durable Mill upon the market. Catalogue upon application.

MINE BELL SIGNALS.

Adopted, Used and in Force in Accordance with State Law.

For the convenience of our readers in the mining counties we print in legal size, 12x36 inches, the Mine Bell Signals and Rules provided for

in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and Rules, printed on cloth so as to withstand dampness. 50 Cents a Copy.

To Unwater Leadville Mines.

The accompanying illustration represents a portion of the district of Leadville, Colo., to be affected by the proposition to unwater certain groups of the down-town mines which have been closed down for the past two years or more. The mines affected include the Welden, Bonair, Henriette, Maid of Erin, Penrose, Coronado, Northern, Bohn Shaft, Augusta, Bison, which are on and at the foot of Carbonate Hill and which in the past have been heavy producers of lead-carbonate and oxidized iron ores, carrying silver values, and to successfully pump them out and resume work means a doubling of the tonnage output of Leadville district.

An important group in the district deluged with water was for a long time controlled by Smith & Moffitt as lessees. The Home Mining Co. was organized by Leadville citizens, which purchased the interests of Smith & Moffitt and joined other lessees and owners in forming a pumping association which is to undertake the work of unwatering the mines. This association is stated to have \$50,000 now available to start the work. S. W. Mudd, a Leadville mine operator, has been chosen manager of the association.

PORTION OF DISTRICT OF LEADVILLE, COLO.

Oil in Southern California.

Los Angeles, Ventura and Fresno counties yield petroleum in considerable quantity, and a variety of commercial products are produced therefrom. The Los Angeles county oil fields mostly derive their oil from a 40-foot stratum of sand carrying about 10 per cent of oil, at a depth ranging from 740 to 1290 feet. The annual output is over 1,000,000 bbls., at present quoted at \$1.15 per bbl., used mainly for fuel purposes. In Ventura Co. the company which handles nearly all the oil in that section, manufactures about

forty products which meet with ready sale. Crude Ventura petroleum of 23.5° B., .912 sp. gr., analyzes: carbon 84%; hydrogen, 12.7; nitrogen, 1.7; oxygen, 1.2; sulphur, .4. All these crude oils carry asphalt, held in combination with the high-boiling members of the hydrocarbon series, and being of a complex character make refining unusually difficult: 100 bbls. mixed crude oil, Ventura Co., 24° B., will give an average product of 3 bbls. gasoline 76° B., 4 bbls. benzine 63° B., 15 bbls. kerosene 45° B., 8 bbls. heavy kerosene 38° to 40° B., 21 bbls. gas distillate 28° B., 10 bbls. light lubricating oil 26° B., 12 bbls. neutral oil 26° B., 6 bbls. heavy neutral oil 21° B., 5 bbls. re-

duced stock, lubricating oil, 14° B., 11 bbls. crude asphalt. The relative fuel values of coal and oil are about one ton of coal to three barrels oil. In locomotive consumption results favor oil in a greater degree: with coal costing \$6.60 per 2000 lbs., and oil costing \$6.03 per 2000 lbs., a passenger engine on the Southern Cal. railroad in a 7000-mile run test showed a coal cost of 26 cents per mile, as compared with an oil cost of 12 cents per mile.

Los Angeles oil has a gravity of 15, Santa Barbara 14, Ventura 15 to 26. The total quantity of crude petroleum above ground in the Los Angeles field Sept. 1st will approximate 270,000 barrels.

Since October 1st, 1894, W. L. Watts of the California State Mining Bureau has been engaged in a scientific examination of southern California oil fields, studying the geological features and comparing the stratigraphical conditions of the several oil-producing sections, some of the results of which have been given in lectures, monographs, and other published reports.

AN OIL WELL IN VENTURA CO., CAL.

THE first aluminum cable ever made will be put in place next week to carry current to the National Electrolytic Co., Niagara Falls, N. Y. It is made of bars 25 feet long, 6 inches wide, 1/4 inch thick, four such bars placed parallel and bound, riveted and bolted every 25 feet. This aluminum cable requires greater insulation than copper; but as it is expected to have double the conductivity, while being much lighter, the experiment is expected to be satisfactory from an economic standpoint. The cable weighs 22,000 pounds; a copper cable sufficiently large to carry the same current would weigh 48,000 pounds.

Needed Governmental Action.

A plain tale is told on page 156 regarding north-western Alaska and the Yukon region by an old experienced miner and prospector. It contradicts the dazzling reports emanating from interested sources, and confirms what this paper has all along maintained, viz., that to those fitted for the adventure in a country where none but the daring start and none but the fittest win, there is a fighting chance for good fortune, but that there are easier and quicker methods of suicide open to those who go in ignorance or unprepared. There is a heavy load of moral responsibility on those who from motives of gain have lured thousands to that region.

The U. S. Government this week determined to deal an effective blow to some of the Alaska and Klondike "transportation companies," and through Gen. Merriam, commanding this department, gives notice that the officer in command of the U. S. troops at St. Michael, Alaska, will prevent the landing on the military reservation there of anyone unable to make satisfactory showing of his ability to support himself there for one year, or to proceed at once beyond the American boundary. The "transportation companies" have been bringing up loads of improvident passengers and dumping most of them at St. Michael for the Government to feed. Some of the deluded crowd push on up the Yukon, but their strength and supplies giving out, they are stranded sick and penniless in a region whose rigors are known only to those who have experienced similar hardship. Trouble at some of the interior points is feared, for an empty stomach has no conscience, and starving men have vague ideas on the ownership and acquisition of property. Gen. Merriam is going to at once send a battery of artillery to Fort Yukon and there establish a military post. With this expedition he will also send supplies of provisions, etc., to relieve the threatened distress. It is high time such action was taken, and the Government in addition could with great propriety establish military rule in that region even to the suppression of the rascally practices of some of those transportation companies. Of course there is no law in this country to prevent anyone making a fool of himself, in addition to the large normal number to whom nature has denied that privilege, and it may be argued that it is no part of the governmental function to take care of those who haven't sense enough to keep from being fooled by newspaper stories of treasure, but there are many thousand well intentioned but misguided men now in the Yukon region who need immediate relief; there are thousands more who have mind to go, and it may well be the province of the Government to aid those who are there and help back those who unwittingly want to engage in an adventure for which they are not prepared.

Gold From Seawater.

Eastern papers are full of the fiasco at North Lubec, Maine, where the usual swindle was perpetrated with the usual result. Many well-meaning, credulous investors have lost their money through the manipulations of rogues, and the papers in Boston and elsewhere that editorially favored the swindle are trying to explain.

The theoretical existence of gold in minute quantities in seawater enabled the promoters of the most recent fraud, by speciously worded statements, to produce belief that they had succeeded in profitably producing gold from the waters of the ocean. With great show of scientific procedure, they sent regular consignments of gold to their Boston office, omitting to state that this gold so exhibited was paid for with part of the money received from their dupes by the sale of stock. To doubters they exhibited their "plant," and its workings, brought in their "chemists" and "assayers," who showed tests, analyses, and, above all, tangible results of gold "won from the waves," taking good care, of course, to keep out any one likely to be possessed of sufficient technical knowledge to see the fraud. Some of the officers of the company were not on the inside, but were duped by others in the secret, part of the "salting" being done by substituting gold amalgam for quicksilver, and the employment of a diver, who placed chloride of gold in the experimental pans under water, the "loading" being lowered through the ice in Narragansett bay last winter. The president of the company writes: "If there was any trickery, it must have been under the ice." It looks as though there was a good deal of trickery over the ice, also.

This extraction of gold from seawater has engaged the attention of men for over a century. As scientific research developed the fact some years ago that every brick in the brick-built city of Philadelphia contains two cents worth of gold, so analysis has shown that in every ton of seawater there is from one-fourth to one-half a grain of gold. But it would ordinarily cost about as much, proportionately, to extract the gold from the seawater as to secure the gold from the bricks in the Pennsylvania metropolis. It is not scientific nor other than dogmatic to say that anything is "impossible." "Impossible" things are merely things that have not yet been done. But, so far, any one claiming to have extracted gold from seawater at anything like the approximate cost of the operation may be considered a charlatan and a fraud.

In connection with this matter the following letter from J. W. Pack, the assayer of the U. S. Mint in this city, will be read with present interest. We consider it a valuable contribution on what is, in the abstract, an interesting subject:

EDITOR MINING AND SCIENTIFIC PRESS:—I have read with great interest the articles in a Boston paper regarding the Electrolytic Marine Salts Co. and their works at North Lubec, Maine. It seems to me that any company with a capital stock of 10,000,000 shares is carrying such a heavy load of stock that it will find it exceedingly difficult to reserve sufficient energy to battle with the ocean for the gold it possesses.

Several papers of late have stated that I claim to have found gold in solution in ocean water to the value of four cents per ton of water. This is somewhat misleading. I find the gold in the ocean water proper only in solution and amounting to about 0.5 of a grain—in value about two cents—while the gold in the San Francisco bay is probably about twice that amount, but largely in a finely divided state, only a portion being in solution.

The quantity of gold and silver contained in the ocean water, and the possibility of profitably extracting them, has been under discussion for many years. In 1851 Malaguti and Durocher reported their discovery of silver in seawater, but said nothing relative to the gold it contained. In 1872 Sonstadt discovered gold in seawater, but did not state the exact amount he found, but said it was less than one grain to the ton of water. Mr. James Park, formerly director of the Thames School of Mines, also mentions the fact of the presence of gold in seawater.

Prof. A. Liversidge, in his paper read before the N. S. W. Royal Society "On the Amount of Gold and Silver in Seawater," estimates the seawater off the coast of New South Wales contained .5 grain of gold to the ton. In 1897 Prof. John R. Don of the University of Otago, N. Z., in a paper entitled "The Genesis of Certain Auriferous Lodes," treats to some extent upon the amount of gold in seawater,

giving the amount which he finds, .078 grain per ton of water.

For a number of years I have been very much interested in the problem of a successful separation of the gold from seawater, my first experiments being made in 1884, and continued at different times till 1893.

The first tests were made with the idea that the extraction could be made as an independent business simply for the saving of gold alone, but after several trials I soon became convinced that this was not practical under present conditions.

After numerous other experiments the thought occurred to me that the only way in which the separation could be carried out profitably would be in saving the gold as a by-product in connection with the manufacture of some other article of general use in which salt water was largely used, and, of course, the manufacture of salt at once presented itself. I then visited some of the salt works in California and Nevada to examine their method of work and see where the separation could be carried out with the greatest probability of success.

During these investigations a curious fact was presented. After examining numerous samples of concentrated ocean water and finding the gold reaction in all, I secured ten gallons of concentrated water from salt marshes in Nevada, and after repeated tests failed to find the slightest trace of gold in the water, which at first was a great surprise, but on further study I can see how it would be out of the question to find gold in such water. These salt marshes are caused from fresh water passing through salt beds below the surface and finally flowing out in some valley or low land. These salt beds may be formed from the evaporation of ocean water, but still the condition of the gold would be changed, for after the evaporation had been carried so far that the entire amount of solid matter has been crystallized out, yet during the long period of the moistened condition of the mass thus crystallized out the electric earth currents would be gradually effecting a change on all of the metallic salts that had been crystallized out as chlorides, sulphates or bromides, eventually converting them to their metallic condition, thereby causing them to be insoluble in water, while the alkaline chlorides and sulphates would still be readily dissolved.

A peculiar circumstance which occurred several years ago during my experimental work with an electric battery convinced me of the important part played by weak, but constant, electric currents in converting metallic salts existing in nature to their metallic condition. Each of the battery jars was set on a small, glazed earthenware plate; a small quantity of sulphate of copper solution had accidentally been poured onto three or four of these plates; the strength of the battery had been about exhausted, so it was left standing in that way for several weeks. When I had occasion again to use it, I found that the sulphate of copper had crystallized, and then the weak current, by long-continued action, had converted a portion of the sulphate to metallic copper, which adhered with considerable tenacity to the glazed surface of the plate, and it was in exactly the same shapes and forms as the fern-like shapes that are often found painted by nature on porphyry rocks in black lines, and said by some to be photographed on the rocks.

Now, connecting this circumstance with the fact that so often in nature we find gold, silver and copper, when in the native state, taking the same forms and shapes, I have drawn the conclusion that all such occurrences have been caused by the long and constant effect of the electric earth currents, thereby converting these metallic salts to their elementary condition. These circumstances had an influence on my experimental work and in a measure directed the plan which was best to follow.

I also received, through the kindness of Prof. Geo. Davidson, five gallons of the water of Salt Lake, Utah, for test, which resulted very satisfactorily, not only demonstrating that this water contains somewhat more gold in solution than the water of the ocean, but also conclusively demonstrating the fact that that great lake was once a portion of the ocean and not formed by mountain streams, receiving its salt qualities from beds of salt through which some of these streams flowed, for, if the last was the case, there would be no indication of gold in solution.

A method of separating the gold might be adopted in connection with the manufacture of salt from seawater. We know that ocean water contains salts of the following elements, as carbonates, chloride and sulphates; calcium, sodium, magnesium, potassium, silver, gold, iodine and bromine. The gold may be in combination with the bromine or iodine.

The first four crystallize out of solution before the others, very much in the above order, the calcium dropping out first, then the sodium, then the magnesium; if it were not so the common salt of commerce would be unfit for use, as it would also contain salts of both calcium and magnesium.

After most of the chloride of sodium has become crystallized the remaining water is drawn off and represents about 1 or 2 per cent of the original water used, and this remaining solution, called bittern, will contain the salts of magnesium and potassium as both chlorides and sulphates. The gold also

remains in solution, salts of this metal being held in solution till nearly all of the other salts are completely crystallized.

So here we have in a condensed form as a by-product to the manufacture of commercial salt, the condensed solution containing the metal we are desirous of separating, and in a solution which is well adapted to the successful working of the separation.

This bittern is at present, after extracting the sodium chloride or common salt, discharged into the ocean again and so all lost.

The knowledge that gold is contained in ocean water, together with the fact that so much of the black magnetic sand on the ocean beach contains gold, first led me to believe that electricity played an important part in the separation. Then upon examining some of this gold contained in black sand with a strong magnifying glass, and finding the most of it to be in thin scales with edges somewhat rolled over and the surface of these scales filled with small depressions and holes, convinced me that these scales were formed on the surface of these small particles of magnetic sand and that electricity was the principal agent causing the deposit of gold of this character; the scales afterwards becoming loosened by abrasion and falling off.

My experimental work upon this subject convinces me that the proper method of reclaiming this gold is by operating upon the bittern or residue water from the manufacture of common salt, and in this way alone there is a possibility of making the separation successful, for one ton or about 200 gallons of this water should contain, still in solution, all of the gold from 100 tons of ocean water, which is the amount evaporated in making about three tons of salt. This, I believe, will be the true solution of the problem.

JOHN W. PACK,

Assayer U. S. Mint, San Francisco.

Aug. 5th, '98.

Concentrates.

The Boise, Idaho, assay office shipped \$23,641.53 in July.

The bullion receipts at the Denver, Colo., branch mint for July were \$2,001,349.48.

The Old Jordan & Galena mine at Bingham, Utah, employs 110 men and has 20 leasers.

The Snowshoe mine at Libby, Montana, has been sold to an English company for \$140,000.

"CERUSITE" is lead ore in the form of small white needles or fibers, slightly resembling asbestos.

LATE arrivals report extreme heat in the Klondike, the thermometers at Dawson registering 110° F.

PLACER miners on Rock creek in the Boundary district, B. C., are said to be making \$7 a day per man.

The Hope mining property near Salmon City, Idaho, has been sold to the Drum Lumber Co. for \$75,000.

COPPER is now being produced in commercial quantities at Cuprum, Idaho, from ore from the Peacock mine.

SYLVANITE, or graphitic tellurium, is a telluride of gold; composition, tellurium 55.8%; gold 28.5%; silver 15.7%.

The Virginia mine at Rossland, B. C., will erect a new plant at a cost of \$30,000, capable of sinking 1200 feet.

The Jay Gould stamp mill, near Helena, Mont., was destroyed by fire last week and is a total loss. It cost \$60,000.

TWENTY cubic feet broken quartz weighs a ton; eighteen cubic feet gravel in bank, or twenty-seven dry, will weigh a ton.

M. D'ARSONVAL asserts that liquid air will soon be purchasable at "a dollar a bottle." The size of the bottle is not stated.

"SILVER's highest quoted price in the last ten years" was on Aug. 20th, '90—\$1.19½ per ounce. To-day it is just one-half that.

It is locally estimated that the Ontario and Daly mines at Park City, Utah, will be operating with a full force within ninety days.

The first hydraulic gravel elevator was put in by the Yreka Creek G. M. Co. at Yreka creek, Shasta Co., Cal., in 1880. It was of the Cranston type.

ACCORDING to Arizona papers, the United Verde copper mine of Arizona, which a few years ago found difficulty of sale at \$15,000, "now pays annually \$4,000,000 above expenses."

In fifteen days eight men working on tailings from the King of Arizona mill, in Yuma county, Ariz., by the cyanide process, secured \$6000 in gold.

AMONG the improvements in the power plant of the North Star M. Co. at Grass Valley, Cal., will be a Pelton water wheel 33½ feet in diameter.

THIS is a great year for the prospector, and now is his favorite season in any part of the mining country where grass and water may yet be found.

MERCED, Mariposa, Co., Cal., mining stock is quoted on the Boston Stock Exchange at \$6; that of the Pioneer, Placer Co., Cal., Mining Co., at \$5½.

The Grand Central mine at Mammoth, Utah, will put in a hoist of 2000 feet capacity, a 10-drill compressor and a wood-working machine, all electrical.

The steam wagon in use at the De Lamar mine at De Lamar, Nev., has given such satisfaction in transporting ores that another and a larger one will be added.

APPLICATION for a patent will not hold a mining claim. The requisite annual assessment work must be done till final entry and payment of purchase money.

The Virginia, Nev., Miners' Union, whose membership is now being depleted, is the oldest similar association in the country, having been organized in 1863.

CALIFORNIA has forty mountains, the highest peaks of which are more than 10,000 feet above the sea. Colorado has fifty-nine peaks which are over 13,000 feet in altitude.

It is estimated that the output of the mines at Butte and Anaconda, Mont., is over 11,000 tons a day, and that this will be increased 20 per cent before the close of the year.

The Commonwealth Co. at Pearce, Arizona, is credited

with intention to add another 20-stamp mill, which would increase their treatment of ore to over 100 tons per day.

SEVEN different religious denominations hold consecutive Sunday service in the one church in Skaguay, Alaska, divine worship being continuous therein from 8 A. M. to 9 P. M.

THERE are two "Kootenais," the British Columbia Kootenay and the Idaho Kootenai. The latter lies within the southwest angle of the 49th parallel and 115th meridian.

Not all the money made in the Klondike is by mining direct. Interest rates range from 6% to 9% per month, the supply of coin is limited, and the collateral is usually ample.

In its report for the year ending June 30th, '98, the Victor, Colo., Gold Mining Co. figures that the average cost to it of producing each dollar in value of gold during the year was 40 cents.

It is locally reported that the Rothschilds will build a smelter of 200 tons capacity near Coyuca, Mexico, on their Ingoran mines, for which they are said to have paid six million dollars.

E. HUNT, who has spent a year prospecting in the Sierra Madre country, Mexico, reports the discovery of gold and silver properties, and a large influx of prospectors into that country.

J. EARLE, Supt. Mammoth M. Co. at Mammoth, Utah, says that recent reports of the moving of ground in the old works have no foundation. He believes they were inspired by stock jobbers.

The capacity of the new reservoir of the Homestake mine at Lead, S. D., is 1,000,000 gallons. The new engine being placed there has a capacity of 2000 H. P. and will lift four cars of ore 3000 feet.

THE rapidly with which Park City, Utah, people who sustained losses in the recent fire are rising is taken to be indicative of the confidence in the future productiveness of the mines of that locality.

SOME mining companies incorporated in Spokane, Wash., and operating in British Columbia, talk of dissolving the corporation in the United States and reincorporating in British Columbia to avoid the stamp tax.

THE Sonora, Cal., *Union-Democrat* says that in one of the main ditches of the Tuolumne County Water Co. is a gold-saving flume which has been cleaned up periodically for thirty-four years, and has yielded \$63,741.62.

W. HOSKINS, shift boss in the Champion mine, Nevada City, Cal., while ascending the shaft, raised his head, and was struck by the cable roller in the roof of the incline. He died from his injuries a few days afterwards.

NEAR Whittier, Cal., S. M. Woodbridge has tested the sulphur discovery and finds that it runs nearly 50 per cent sulphur. He has ordered machinery to work the property and expects to establish a permanent industry.

THE Smith-Moffatt electric power plant at Goldfield, Colo., will be completed Nov. 1st. Its cost will be \$150,000, and it will be one of the largest electric power plants in the State, capable of generating electricity equal to 2000 H. P.

THE Denver, Colo., *Mining Record* says that in San Miguel county, Colo., more development work is in progress than ever before in the history of the county, and that as a consequence money is more plentiful and all classes of business prosperous.

THERE is no conflict between the mining laws of the U. S. and the State of Washington. There can be no "conflict" of the kind, for whenever a State law opposes in any particular a valid federal statute on the same subject, the former is overridden.

AT any time after the discovery or location of a mining claim the claimant can file with the register the certificate of the U. S. surveyor-general that \$500 in labor or improvement has been put on the claim, and application may be made for a government patent therefor.

DURING September the offices of the California State Mining Bureau will be transferred from the Pioneer Building, on Fourth St., San Francisco, to the top floor of the ferry depot building, at the foot of Market street. This includes the museum, laboratory, library, etc.

IN the United States court at Seattle, Wash., on the 1st inst., George D. Rogers, trustee, obtained a judgment by default against the United Concentration Co. for \$172,411.45 in a suit for the foreclosure of a mortgage. The property involved is the Monte Cristo, Wash., mine.

THE Union Pacific Coal Co.'s mines, at Hanna, Wyo., have been shut down. Two months ago the miners in this property struck, but were permitted to return to work at the old scale of wages. Since then a Miners' Union has been formed, to the dissatisfaction of the company.

THE gold refinery of the De Lamar Golden Gate mill at Mercur, Utah, is constantly under armed patrol. After the door is locked within, each evening, no one is allowed to enter, the superintendent, who directs the retorting of the auro-cyanides, not excepted.

THE Associated Gold Mines of British Columbia, Ltd., has among its eight directors a duke, an earl, a baronet, a knight and a major. The capital stock is £500,000, and the prospectus says "clean, solid ore in sight can be shipped in large quantities, immediately." The combination should be irresistible.

GEO. H. PROCTOR has again appeared on earth and is pushing his Pike's Peak tunnel scheme. He is credited in Colorado with having spent \$110,000 in three days about one year ago, advertising the proposition. Leiter and Hooley blazed and darkened, but Proctor and Giles Otis Pearce still gleam.

THE Overman, one of the Comstock companies, at a meeting on the 5th prox. will consider disincorporation. Meanwhile work is suspended. In its long history the Overman has levied assessments to the amount of \$4,163,520. It has produced considerable bullion, too, but has never declared a dividend.

DURING July the receipts at the San Francisco Mint aggregated \$6,143,448.97 gold and \$8,302.86 silver, the latter being partings from gold deposits. The amount—\$6,143,448.97—is the largest single month's receipts of gold in the history of the mint in this city. The compiler of this "Concentrate" in its preparation looked up the records back to 1854.

PROBABLY no metal mine on this continent has paid greater aggregate dividends than the Con. Cal. & Va. mine of Nevada which thus disbursed \$77,608,500; this was from ore that averaged 46% gold and 54% silver. The Calumet & Hecla copper mine, Michigan, has a dividend record to date of \$53,850,000. The biggest California gold mines are unincorporated and no public record of their profits is attainable. The Idaho paid in

dividends \$5,489,000; the Standard \$3,771,159; the Kennedy has paid \$2,400,000; the Plumas-Eureka \$2,696,295.

IN experiments with the compressed air pipes of West-phalian coal mines, H. Schab has found that the greatest distance to which the sound of the voice could be conveyed in a straight pipe was between 1500 and 1700 feet. For moderate distances a pipe of about 20 inches in diameter gave the best results, a slightly larger one being better for long distances.

THE assay-ton system of weights was devised by C. F. Chandler of Columbia College. As there are 29,166 ⅔ troy ounces in one ton avoirdupois—2000 pounds—the assay ton contains 29,166 ⅔ grams; hence, if one assay ton of ore is taken for assay, and the resulting button weighs ten milligrams, the assay value of the ore will be ten ounces per ton. One ounce per ton is 0.00343%.

COLORADO STATE COMMISSIONER OF MINES H. H. LEE will present to the Legislature the following bill: "That all abandoned mine shafts, pits or other excavations, endangering the life of man or beast, be securely fenced or covered, and any person or persons removing or destroying said covering or fencing shall be guilty of a misdemeanor under this Act." The penalty will be placed at not less than \$100 nor more than \$500.

IN his voluminous report just issued, the British Consul General at San Francisco devotes much space in the report to the modern methods of acquiring mining property. He summarizes: "The misfortunes that have befallen the British mining investments in California are attributed to unbusinesslike methods in acquiring or working property, investing in mines that are fully developed, neglecting to have them thoroughly examined, sending out men to manage mines who have had no practical experience in business, and the greatest cause of disaster is the capitalization of such concerns by London promoters."

THE Mint Bureau estimates the world's production of gold for the calendar year '97 at \$340,000,000 and probable production for '98 at \$375,000,000. The gold production of the United States for '97 is estimated at \$58,000,000, South Africa \$60,000,000. Australia is only slightly below this figure. It is thought that the gold production of Africa for '98 will be \$75,000,000. If Australia, as returns indicate, shows a production of nearly \$80,000,000 and the United States shows \$63,000,000, these three countries will aggregate a gain over '97 of \$20,000,000, and will contribute nearly \$200,000,000 of the gold production of the world. The production of the Klondike region is not included in these figures for the United States. The production of the Klondike for '98 is variously estimated at \$5,000,000 to \$10,000,000.

URANINITE (uranium oxide) is the ore usually found by prospectors and generally occurs in connection with lead and silver ores, very rarely in masses. The crystals are octahedrons. The color may be gray, brown or velvet black, and sometimes has a lemon yellow coating of uraninite. It is rarely found as a pure ore. The hardness is six and the gravity ten, being softer than quartz, which is seven, and heavier than galena, which is 7.25. It will scratch about as easily as ordinary feldspar, which is six to seven. It is hard but slightly malleable. With the oxidizing flame of an ordinary blowpipe an equal amount of the ore and borax will give a red scoria when hot and yellow or gray when cold. Reduced to a powder it will dissolve very slowly in nitric acid. The streak or powder formed by scratching with file or point of knife is black. It has but little luster, being dull or sub-metallic.

SEATTLE, Wash., sends an "official statement" of the amount of gold from the Klondike this season, aggregating over \$13,000,000. Like other "statements" therefrom, the amount is greatly exaggerated. Supt. Leach of the U. S. Mint in this city estimates the output at \$5,000,000. Probably \$6,000,000 would be an outside estimate of the '98 Klondike gold shipment so far. Mr. Leach, as superintendent of the government mint, is in a position to speak with exactness. Sooner or later nearly all the gold produced anywhere west of the Rockies finds its way to the U. S. assay office or mint. So far this season the U. S. mint here has received about \$2,000,000 Klondike gold and the new government assay office at Seattle about an equal amount. Estimating another million and a half still to come would make an aggregate of \$5,500,000, which is believed to approximate the gold amount brought out from that region this season.

FOLLOWING are the depths from the holting works of the leading mines on the Comstock to the level of the Sutro tunnel or its branches; also the angles of the inclines, where there are inclines, from the bottoms of the main vertical shafts: Utah, 1465 feet, angle of incline 46°; Sierra Nevada, 1501 feet; Union shaft, 1502 feet; Ophir, 1600, pitch of incline 37°; C. & C. shaft, 1500; Con. Va., 1625; Bonner shaft (Gould & Curry mine), 1676, 55°; Gould & Curry and Best & Belcher shaft, 1443; Savage, 1650, 33°; Hale & Norcross, 1626, 40°; Chollar-Norcross-Savage shaft, 1598; New Yellow Jacket, 1513; Old Yellow Jacket, 1430, 45°; Old Bullion shaft, 1766, 41½°; Con. Imperial, 1732, 43°; Crown Point, 1394, 35°; Belcher, 1449, 33°; Overman, 1201; Alta, 1030; Forman, 1495; Caledonia, 1153; Justice, 930, 40½°; Silver Hill, 757, 38°; Old Chollar-Potosi shaft, 1695, 45°; New York, 1059; Baltimore, 1205, 38°. These measurements are from the surface to the ground at the top of the shafts.

UNLIKE low-grade metal, rich copper matte does not rapidly float up, detaching the semi-fused masses of ore from the furnace bottom and thus shortening the process. Rich matte is assumed to be thoroughly calcined, so that there is not only a less proportion of easily fusible sulphides, but much of the sulphide of iron present has been changed into ferric instead of ferrous oxide, which is nearly infusible and must be for the most part reduced to the lower oxide before it can combine with silica. For these reasons, and more especially for fear of producing too rich a slag, the Swansea custom has forbidden the production from the first fusion of a matte above 35 per cent copper. The presence of arsenic and antimony, which require for their removal a long series of alternate oxidations and reductions, has also favored this process, but with American purer and richer ores, and with the higher prices of fuel and labor, it has become the custom to produce a much higher grade matte at the first fusion. The following results of work at the furnaces of the Parrot, Montana, Copper Company illustrate the practice. Each assay represents a shipment of fifteen or sixteen tons of matte; the slag samples are average assays of each charge: Assay of matte, per cent copper: 64.3, 62.7, 66.5, 66.2, 65.9, 61.8, 63.6, 64.5, 63.3, 66.2. Assay of slag, per cent copper: 0.85, 1.05, 0.92, 1.10, 0.67, 0.64, 0.87, 0.82, 0.76, 1.32.

As Seen by an Old Prospector.

Written for the MINING AND SCIENTIFIC PRESS by "ALEX. QUARTZ,"
Alaska Correspondent.

St. Michaels, the city of huts, the scene of confusion, the nucleus of the gold seekers! A busy place. The shore and banks are covered with tents, thronged with people passing to and fro, with no apparent object in view other than to obtain information. The harbor is filled with vessels, sailing and steam, and boats of all descriptions. There are upwards of 3000 people here, some on their way home from the Klondike and other up river points laden with gold; others returning disheartened with tales of hardship, privation and disappointment, denouncing the country. A large number came down on the first boats for supplies of tools, provisions, native boots and clothing, and are going back again on the first boats up the river to try their luck another year. There is one point on which all who come from the Canadian side agree, viz., that the miner and prospector is not given a "square deal." Their laws are too strict and the Government takes the lion's share of the output of all claims and has the power to revoke the miner's lease at any time it sees fit. This drove a vast horde of miners and prospectors over the line this spring onto the American side, where the laws are liberal. From November last until the latter part of June of this year I have put in the most of my time traveling and prospecting, and during that time have seen considerable of northwestern Alaska, and, like many more, I am more favorably impressed with this section of country lying north and west of the Yukon from the Manook district west to Norton bay and Norton sound, and as far north as Golovin bay. Several important discoveries have been made in this coast country during the past winter, the best to date being Auvik and Golovin bay. They are both promising districts, and so far the surface prospects, if they indicate anything, are far better than anything found in the Manook district or any of the other districts up the river. Any other than surface prospecting has been out of the question since the rivers and streams broke up on account of high water. But now the waters are rapidly falling and the next three or four weeks will determine the richness of the principal creeks. The Auvik district, of which Edwin Engelstad, my partner, and myself have the honor of being the discoverers, is in a northeasterly direction from St. Michaels about seventy-five or eighty miles, in a broken, mountainous country, on which no white man ever set foot before us. It has been known for several years to many of the old-timers in passing up and down the Yukon that there was gold in the bars at the mouth of the Auvik, where it flows into the Yukon, but none of them ever went up the river to prospect it. Last summer Pitka Golsan, a half-breed Russian, prospected up the river for over 150 miles and found gold in the bars all the way up. On the knowledge gained from Golsan and the natives Engelstad and myself entered into partnership to prospect and explore the Auvik country. Accompanied by Pitka Golsan, three white men and two natives, with three dog teams and three weeks' supply of provisions, we arrived at the Auvik on the 5th of last February. In less than a week I discovered in different places prospects sufficient to induce me to establish a camp there and prospect and explore the country thoroughly during the winter—which is the only time to travel by land in this country.

We found all the maps and charts incorrect regarding the interior country, and especially so in relation to the Auvik and lower Yukon country. Instead of being an insignificant little stream rising in a large lake, we found the Auvik a large river draining a vast, high, mountainous country, stretching over 200 miles in width, from the coast range of Norton sound on the west to the Yukon on the east, in which there is plenty of room for the adventurous prospector.

Our discovery on the Auvik and its tributary creeks is over 200 miles above its mouth, where we organized the "Golsan mining district." The locations to date are confined to Macdonald creek, Independence creek, Ruby and Garnet creeks and the Auvik river. Shortly after our discovery the news reached St. Michaels, and some seventy odd men made their way into the new district and made locations. In the meantime, reports reaching St. Michaels were many and greatly exaggerated, which were the means of starting a stampede for the Auvik. General Randall, the commanding officer here, being satisfied that the discovery was within the 100-mile limit of the military reservation, nipped the stampede in the bud by positively refusing to allow any work or prospecting to be done in the new district until he received orders from the Secretary of War in Washington, D. C., to that effect. Prior to this, we (the discoverers) made application to the Secretary of War, through the commanding officer, General Randall, to have that portion of the reservation set aside for mining purposes, at the same time applying for permits to mine in the district, giving a full description of the claims; and so the

matter rests at the present time and will until we receive our permits from Washington, which will be in the latter part of the season. There is no doubt about the permits being speedily granted, for many reasons, even if that portion of the reservation is not set aside for mining purposes. General Randall acted wisely in the matter and deserves great credit for the manner in which he handled the case, which would have eventually ended in a mixed state of affairs and necessitated the maintenance of soldiers in the district, owing to the difference of opinion as to whether military law would apply to mining within the limits of the reservation or not, and which would cause trouble over titles and the sale of claims, which is not permitted under military law. Besides, the stampede would have deprived the companies at St. Michaels of their help and made a bad state of affairs generally.

We demonstrated to our own satisfaction during our winter prospecting, by sinking shafts through snow and ice, both on Macdonald creek and the Auvik river, that those two places, at least, will yield good pay, although we were unable to get to bedrock in either place, on account of the water, which never freezes in the channels of the coast country streams, owing, likely, to numerous thermal springs feeding the creeks and rivers. The gold of the Auvik country is of high grade, going \$19 per ounce, and its origin or source is purely local, coming from the formation tributary to the streams in the district. The formation is principally diorite, porphyry, black iron slate and granite, all of which are well mineralized. There is very little evidence of quartz in the creeks and river wash, and there is no trace of glacial action or volcanic matter.

The great advantage this new district will have over all the other districts so far discovered is because it is within eighty miles of a never-failing base of supplies (St. Michaels) where goods, tools, etc., can be had for half what they cost on the Yukon; easy transportation from the coast, being only a long day's journey from a landing on Norton sound, thirty-five miles north of St. Michaels. In summer pack animals can be used, and in winter dog teams, for freighting over the mountains. The diggings can be worked winter and summer once they are opened, and \$10 per day to the man is better than \$25 per day at any of the camps up the river. The pining process can be used during the summer months, and it is continual daylight here during the most part of the working season; so, by running a night and day shift, a six months' run can be made during the season with a giant.

The river has so much fall that it is not navigable even for a small boat; consequently, there will be no difficulty in disposing of tailings. All of the tributaries have great fall, also, which is a great point in their favor. There is an abundance of timber—spruce, cottonwood and birch—which answers all purposes. This section is destined to become the chief mining center of northwestern Alaska within the next two years. Although bedrock has not been reached by any of us, on account of water from the confined channels underneath rising over the ice in winter and high water from melting snow and ice this spring, still we have proved to our own satisfaction that on the river and Macdonald creek the gravel contains pay from the surface down, increasing gradually down as deep as we were able to sink in the water.

The Golovin bay discovery, which is located about 150 miles northeast of St. Michaels, was made last winter by the Mordaunt and Libby party, consisting of Messrs. Mordaunt, Libby, Blake and Melsing, who wintered there. The existence of gold in Fish river and its tributaries has been known to the old-time traders here for the past eight or ten years, dating from the time of the discovery of the Green galena silver mines, now idle. Three years ago my partner, Mr. Engelstad, who has been a trader here for the past ten years, fitted out a prospector to prospect Fish river and its tributaries for placer digging. After he had prospected the Neukluk, a tributary of Fish river, and found a prospect to justify working, he heard the news of the strike first made above Circle City and he dropped all work and started for the Yukon and arrived in time to be one of the first on the ground after the discovery of the Klondike.

No prospecting has been done since until last winter, when the above-named party discovered pay on Ophir and Melsing creeks, which are tributaries of the Neukluk river. There is also running water in all the streams of that section underneath the ice during the winter which prevented them from reaching bedrock also. The result of their winter's prospecting demonstrated the fact that rich pay ground exists in both Ophir and Melsing creeks, they having gotten as high as \$12 in four pans of gravel near bedrock. The gold differs from the Auvik gold. It is very fine and principally flaky or scale gold and comes from a black slate formation which is full of frozen seams of quartz which make up a large percentage of the gravel wash in those creeks and the Neukluk river. I have just returned from that district, but during my stay there the water was so high in all of the creeks and rivers that it was impossible to do any prospecting that would determine whether there is pay in all of the creeks tributary to

Fish and Neukluk rivers or not. I went up those two rivers about ninety miles from Golovin bay and prospected all of the tributary streams of Fish river from its mouth to the junction of the Neukluk and then up the Neukluk to near its headwaters, panning in all of its tributaries on my way and found gold in every one of them. But the gold was very light and fine, but no doubt the lower gravel carries coarser gold even before bedrock is reached, when as high as 250 colors of fine gold can be got to a pan on the surface of the high bars in favorable places. There is only one serious drawback to the upper Neukluk and the streams flowing into it, and that is the total absence of timber anywhere above Ophir creek. There are two districts already formed there, or rather organized, viz., El Dorado and Melsing districts. There were twelve miles of placer claims staked on Ophir creek, which is about twenty miles in length, and some half dozen quartz locations, and Melsing creek was all staked up to the head of it, a distance of about eight miles, when I left there a week ago. A townsite has been laid out and the "Council City" of the future consists to-day of a few prospectors' tents and a dense and busy population of millions of mosquitoes. But wherever you find gold you will find obstacles to overcome before you get it, especially in Alaska, and it is only too true that all the gold which a man gets in this isolated, frozen region, though it should amount to millions, he earns at terrible cost. Prospecting for quartz anywhere in northwestern Alaska, like in the interior, is slow and tedious work, for the reason that the whole country, hills, mountains and valleys alike are covered with moss varying from 4 inches to 2 feet in thickness. Some veins of rich rock have been discovered in this coast country, but there has been no development work done up to date to really prove their extent. Every one is looking for placer where riches can be got quickly at a little expense.

There is a couple of steamers here with passengers and outfits for Kotzebue sound, who intend going up the Kowak river to find some of the "mythical Klondikes" that have been extensively written up in some of the coast papers and which has been the means of luring hundreds of people to the Kotzebue sound country to suffer untold danger and hardship, starvation and death in many cases. I deeply regret that I do not possess the power to prevent those people from going to the Kowak river, for there should certainly be something done to silence those who have written up those golden dreams of the Kotzebue sound country for the purpose of duping the gold seekers, for I can see no other objects in the publication of such rank falsehood regarding the richness of the Kowak river and its tributaries as I have read in the coast papers. I have been told by friends here, who are victims of these misstatements, of information given them in San Francisco and Seattle of the gold that they, the authors of the statements, took out, saw taken out, and know for a fact to be taken out, etc., of the Kowak. Here are the undisputable facts and the history in brief of the advent of the white man in the Kotzebue sound country: There has never in the history of Alaska been a Russian trading station on the Kotzebue sound, before or after the purchase of Alaska by the United States. The native pilot, whom Lt. Stoney had with him when he went up the Kowak, for the past two years has been in the employ of Mr. Engelstad, my partner, and he states that they found plenty of mica but no gold, except where they turned back they found occasionally a light, flaky scale of gold that would float away on the water. Lt. Stoney brought out no gold that he got himself or from any one else that had been taken out of the Kowak. Lt. Cantwell and Engineer Leneghan of the revenue cutter Corwin were the only men who were to the heads of the Kowak and Noatak rivers, except Boyd and Folger, and they did not find any gold, neither did they take out any except a few light colors they found on the heads of these rivers, at least not to the knowledge of any white men in Alaska or any of the natives who were with them. The native guide and pilot (Ogitkin) who was with Cantwell on that trip on the Kowak, and one who was with Leneghan on the Noatak river, have traveled with me at intervals for the past eight months and they tell me always, though I have repeatedly cross-questioned them, that there was never anything found on either of those rivers, but occasionally a light color of float gold. Boyd and Folger, two veteran Yukon miners, during the winter of 1895 crossed over from the Koyukuk river to the head of the Kowak and prospected thoroughly and found nothing. Boyd was murdered there by natives who are a vicious set of people, and Folger escaped and is to-day at Manook or up on the Koyukuk. All of the old timers tell me, and their accounts all agree, that Miner Bruce was never ten miles inland in his life on Kotzebue sound, and no white man has ever been on the Kowak or Noatak since the above-named men, and what little gold has been obtained by whalers and traders, etc., from the Indians who inhabit that region has been obtained by trade with the Koyukuk Indians and came from the Koyukuk river and its tributaries and not from the Kowak. Those Indians have repeatedly told me this and related the history of the advent of Boyd, Folger, Stoney, Cantwell, Leneghan, Bruce and Gibson and all of the few white

men who have been in that country. I have tried to convince some of the passengers who came here on the Humboldt and Grace Dollar—people of my acquaintance in California—that it was almost like committing premeditated suicide to go on to Kotzebue sound. I took one party of them and devoted a whole day to introducing them and having them interview traders, missionaries and others who have been for the past ten years familiar with that country and who verify what I have written in this letter, but it was of no avail. The mythical golden dream has so completely entranced them that nothing will dispel it until privation, hardship, misery and death will bring them to their senses. Aside from my own practical experience in traveling and prospecting in that section, my statements in this letter are backed by all of the people residents from St. Michaels north to the Kotzebue sound, and my only object is to save my fellow-beings who intended going to that section from hardship, suffering and perhaps death, with no golden reward for their pains in view other than this mythical "Klondike" on the Kowak river.

Many of the tenderfeet have returned already from Golovin bay, cursing the country, and they say there is no gold there, while all of the experienced miners have remained there and are opening up their claims. It is safe to say that at least two-thirds of the people coming here this season will return in less than a year, worse off than when they came. But all practical miners who have the physique to stand the climate, and who will get out and hustle and apply themselves diligently to their calling of prospecting and mining, will win. This is a good country for a practical prospector or miner to come to, where he has chances to make a good stake, providing he wants to undergo the hardship to earn it. But this is no country for the tenderfoot novice who has no knowledge of mining or prospecting, and who has had no practical experience as such. To this class of people I would say: "Stay away from Alaska; it is no place for you, unless you want to come to the hardest school on earth to learn mining and prospecting."

The Auvik and Golovin bay districts herein mentioned, being new finds, will take another year to develop. Regarding the other districts which are attracting so much attention at present farther in the interior, to say the least of them, so far as developed, they are rich, viz., Manook and all of the adjacent districts, the Koyakuk river and all of its tributaries. Tramway bar, above Arctic City, on the Koyakuk, was abandoned some years ago, not for the lack of gold there, but because at that time it was impossible to get provisions in there to subsist on, which had to be transported by a few men such a great distance that during the open season they were unable to get enough in to last them until the following season. But now things are different. Many new supply points, with ample supplies, have been established nearer to this territory, and there are at least six or eight small, light draft steamers belonging to private parties, some of which are on the way and the others now ready to start within a day or two up the Koyakuk to Arctic City, all of them carrying two and three years' supplies. So next season the output of gold from the Koyakuk alone will be no small amount.

No doubt many of the people on the coast will be disappointed because the output from the Klondike this season will not amount to as many millions as has been reported before the washing season commenced. But when it is taken into consideration that the washing season did not last long enough to wash all the dirt that had been gotten out during the winter, and, again, the fact that under the existing Canadian laws a claim must produce \$40,000 during one season to insure a profit of \$10,000 at the outside to the owner—and oftener the figures range below \$7000 than above it on a total production of \$40,000, this being a liberal estimate—the net result will not be considered as proof against the richness of that section. On the American side a claim producing \$40,000 will, in the most expensive place on the Yukon, yield to its owner a profit of at least \$25,000. Of course, these instances refer to cases where the claims are worked by their owners and with hired help. Still, the people rush on to the Klondike. I have interviewed no less than twenty men here on their way out to the States who came in over the Chilkoot pass this spring, who told me they never had made a stop of five days anywhere on the trip between Dyea and St. Michaels. They all curse the country and denounce the whole thing as a fake. They will ply questions to you by the hour and occupy your time, and then tell you in conclusion that you are deceiving them and that they do not believe you. This is all the thanks a person receives from the majority of the tenderfeet for wasting time with them and giving them information. In conclusion, I will say this is no country for a man to come to without at least \$350 in cash besides his outfit. For the absolute necessities he must have in the way of footwear, clothing, etc., and can only be procured here, are high-priced, and if he does any traveling in winter a good dog team and sleigh will cost him at the least \$200, besides the expense of feeding them, which will amount to \$1 per day. It takes money to travel and prospect in this country, and

the traveler must be well prepared for cold weather. The coldest day I experienced last winter was 68° below zero, and during January, February and the first ten days of March the average was 36° below, when we were traveling back from the coast.

There is a corps of engineers here sent by an English syndicate to survey a route from Norton sound across the Unalakleet portage to the Yukon, a distance of about 140 miles, which will shorten the route to the upper and middle Yukon some 700 miles; and if this syndicate will carry out their plans, it will be the means of more rapid transportation both winter and summer to the country in the interior, and will settle the question of lack of supplies, which has been the great drawback heretofore in the interior. If this road is built as proposed, nine-tenths of the passenger traffic to the interior will go by this route, likewise the freight. Many of the outgoing people from Dawson and up the river points came down the Yukon in small boats, many of which were built at Lake Linderman this spring. The fare from St. Michaels to Dawson by the A. C. Co. and N. A. T. & T. Co.'s boats this season is \$250—a pretty stiff price to pay for those who lost their river boats on their way coming up. Nine river boats and barges up to date are reported lost, most of them being lost in Behring sea. What Alaska needs to develop her mineral resources is hardy, practical miners and prospectors, either with sufficient funds of their own or backed by others who will not limit them to a paltry, stipulated amount. This class of men, if they persevere, will succeed in nineteen cases out of twenty in any part of Alaska. But such "grub-staked tenderfeet" as I have met here generally I regret to say that their chances are slim to have their efforts result in anything else but failure. St. Michaels, Alaska, July 15th, '98.

Utilizing Heat from Exhaust Steam.

The latent heat possessed by exhaust steam is a factor which may be utilized to advantage in the heating of mills, where too often there is an unnecessary waste of fuel arising from an imperfect and unequal distribution of the heat lavishly produced. To use the exhaust steam it must be carried through pipes in which condensation takes place and the heat is liberated. Its progress through the pipes is impeded by the presence of air and water of condensation, requiring some pressure to push it through, resulting in back pressure on engine and pumps. These resisting elements render it difficult to carry the exhaust steam long distances through pipes. The products of exhaust steam are heat and water of condensation, both of which may be used at a mill as a measure of economy. As a rule, both are lost, the water being allowed to waste at the end of the exhaust pipe. At the point of condensation the steam gives off its heat and the water produced is rendered pure by distillation. If the latter can be brought back to the boiler it is more valuable than ever by reason of its purity and heat it contains. Many mills use live steam, right from the boiler, for heating, allowing the exhaust steam to go to waste, when it is a better heating agent than the live steam, owing to the fact that it parts with its heat more readily than does the live steam. This is readily understood by the engineer when he recalls the fact that exhaust steam contains 181 British thermal units of perceptible heat and 965 B. T. U. of latent heat, the latter being the important factor in the result. This question deserves consideration by mill and mine operators from the standpoint of economy. The huge stoves often used in mill buildings in cold climates are necessarily wasteful and unsatisfactory as heaters.

Marked progress has been made by heating engineers in utilizing the heat from exhaust steam in such a way as in a great degree to overcome the difficulties usually incident to back pressure, poor circulation in heating pipes and other attendant obstacles.

A case in point is the system employed at the Tom Boy mill, near Telluride, Colo., which the writer observed last winter. This system, which is known as the Webster system of steam heating, gives results which serve to emphasize the importance of the foregoing. In the Tom Boy equipment a vacuum pump is attached to the return end of the heating coils and a vacuum of 10 inches maintained in the system. At various points in the heating coils, thermostatic valves are used which open and relieve the system of water and air and close at steam, the result of which is a perfect circulation of the steam and no back pressure, and the distilled pure water with its heat is brought back to the boiler for use again.

It is well established that the primary requirements in effective steam heating are: "Absence of back pressure, efficiency of drainage of supply pipe, continuous automatic drainage of condensation, effective circulation, control of circulation, removal of air and gases from heat surface and from feed water, regulation of temperature in any part of the heating surface, return of water from some moderate distance below the line of drip or drainage, if necessary."

Denver, Colo., July 27th, '98.

WASCOTT.

The Atlantic Copper Company, of Michigan, furnish a good example of economical mine working;

the annual report shows an average production of 13.2 lbs. copper to the ton—less than 1%. The total returns averaged \$1.42 per ton. During the year the company employed 500 men, spent \$300,000 for improvements, paid all its bills, set aside a surplus of \$139,000, and paid \$40,000 in dividends.

"The Mother Lode."

It is a misconception, says D. Y. Browne, to consider the mother lode simply as a single and continuous ledge of quartz running for 200 miles through the country; it is rather a line of fissure at the foot of the Sierra Nevadas, filled partly with dykes of porphyry and ruffs of quartz, intersected by masses of black slates, and often ruins of pre-existing rocks, immersed more or less completely in crystallized quartz, the entire ventricular masses showing every sign of metamorphism in a high degree, and the walls of the adjoining country rock abounding in the crevices or cracks of an original cooling of the mass, and filled with stringers and feeders of quartz encased in films of shining black slate (slicken sides), loaded with sulphurets, and often abundant in free gold. This parallel group of veins, from its eastern hanging wall to the west, is of a very irregular width, sometimes only showing a single line of croppings, and at others spreading to several hundred feet. It is accompanied by a series of chimneys as vents at very irregular distances apart on its course, through which immense masses of pure quartz have reached the surface, and which usually lie at a steep angle longitudinally with the fissure.

These chimneys have generally been the pay shoots of the mines. The gold which they brought to the surface in the days of their activity has long since been scattered over the face of the country by the denudation to which it has been subjected from that long ago period when its lofty summits were first broken up and buried beneath the old gravel and lava beds down to the present, where these beds and the underlying rocks have again been chiseled out by the rivers and streams of our times.

There are two chief lines of gold-bearing rocks to the mother lode, the eastern and the western. The eastern rises between walls of black slate, and carries films and sheets of slate into the mass, giving a striped or ribboned appearance. The second, a short distance west, follows a stratum of magnesium rock, characterized by its rusty outcrops. In this we recognize the greenstone (diorite schistos) dykes. The general strike of the slates when not disturbed by local eruption is north and south and dips nearly or quite vertical. The greater portion of these rocks are, however, to be classed among the eruptives. They are in many cases greatly decomposed, and in the induced schistose structure are often mistaken for metamorphized sediments. This schistose structure has generally a north and south direction. As before mentioned, slate forms the western part of the lode, from a belt from a few hundred yards to more than a mile in width. It is cut by many dykes of fine greenstone, and others of hornblende and quartz porphyry.

The quartz veins are formed both in the slate and in the contact with the eruptive and inclosed in them. The diorite schistos, varying to talcose schist, forms a large portion of the system. The greenstone has been derived from a massive crystalline rock by pressure and resultant decomposition; quartz veins are very numerous in it, some of them belonging to the east and west system; float quartz is abundant, and all the gulches show signs of having been sluiced.

South of Sonora the greenstone appears more in the form of dykes; between these are long, narrow arms of metamorphic rocks, chiefly siliceous schists. In these schists are most of the veins on which are located the Rawhide, App, Golden Rule and Jumper mines.

The gold-bearing deposits may be divided into two general classes. To class one belongs the Rawhide mine, while to the other belong the white quartz veins formed after the usual manner, best illustrated by the Kennedy and Golden Rule mines, and which may be properly considered as deposited by replacement and characterized by the even distribution of the gold and small, well-formed crystals of iron pyrites.

All the material of the lode contains iron sulphides scattered through its minute cubes and calcite in small particles.

There are several parallel veins from 10 to 500 feet apart, course north, 16° east, with a dip of 76° east, and from 5 to 30 feet wide between porphyritic hanging and slate foot walls. The quartz is of ribbon structure, interstratified with black slate, carrying from 2 to 8 per cent sulphurets, mostly iron, which concentrate from \$50 to \$300 per ton. The veins are true fissures and deep seated, and I am in doubt if they can be bottomed at a depth of 5000 feet. A heavy foot and hanging wall gouge composed of pulverized quartz and slate highly mineralized accompanies the veins, and in no place have I noticed the freezing of the veins to the walls. In my opinion there is not a better district in the world or one that affords more inducements for investment of capital in legitimate mining than the mother lode of California.

Electrolytic Method for Treatment of Refractory Ores.

An English contemporary notes that during the last few years considerable attention has been given to the treatment of complex ores, such as those existing at Broken Hill, Australia, which on an average contain about 25 per cent of lead, 20 per cent of zinc, and 20 oz. of silver per ton. The following is a recent complete analysis of a sample of Broken Hill ore:

| | Per cent. |
|---|-----------|
| Lead..... | 30.05 |
| Zinc..... | 23.77 |
| Silver..... | .06 |
| Manganese..... | .93 |
| Iron..... | 3.91 |
| Sulphur..... | 18.96 |
| Alumina..... | 1.20 |
| Silica..... | 20.05 |
| Oxygen, traces of gold, arsenic, etc..... | 1.07 |
| Total..... | 100.00 |

The fine silver amounts to 22 oz. 10 dwt. per ton of 2000 pounds.

Several attempts have been made on a commercial scale to deal with such ores, but the difficulties that have arisen in practice have led to the abandonment of such processes. Extracting the zinc with sulphuric acid has been tried by Siemens & Halske, and others. To get a satisfactory leach with sulphuric acid it is essential that the ore should be roasted sweet, free from sulphur; this necessitates the ore being roasted for a long time at a low temperature. Even when the roasting has been done carefully, the extraction of the zinc has been very imperfect, and the losses of the zinc excessively heavy, as it was found necessary to throw away a large quantity of the solution to get rid of the impurities. Silica, manganese, and aluminum going in solution has also been the cause of many difficulties. The new process claims to have entirely overcome all these difficulties, and to have other substantial advantages, both as regards economical working and the purity of the products obtained.

The difficulty of the roasting has been overcome in this by the addition of a mixture of other ores, and the use of an air rake, which facilitates the process of roasting, and enables a sweet roast to be obtained with the expenditure of a small amount of fuel, the object being aimed at is not to drive off the sulphur so much as to oxidize it. The ore, after being crushed dry and roasted, is screened so as to remove the very fine dust or slimes, which are treated by a special process in separate vats, the screened ores being placed in vats which are provided with false bottoms or filter beds. The solution employed for leaching out the zinc is a weak solution of solution of sulphuric acid, which can be made from the sulphur dioxide driven off from the ore during the process of roasting. The leaching solution, after being drawn off from the eputation tanks to remove any copper that may be present, is then circulated through a series of electrolyzing cells, where the zinc is deposited in the forms of metallic plates on an aluminum cathode, or in the form of zinc sponge, which, when dried, forms a substitute for zinc dust, which is in considerable demand. The voltage at the terminals of the dynamo is 60, the electrolyzing cells being worked in series. It is found that only the zinc and copper are removed from the ore, and that the other metals present are not dissolved. The residue, after the zinc has been leached out within a few per cent, is then washed to remove the soluble zinc sulphate. The lead and silver remaining in the residue can be extracted by any of the ordinary methods.

Summary of the Present War Status.

Peace between the United States and Spain is to be declared. The present hostilities began April 21, 1898. Cost in lives to Spain, about 11,000 killed. (No official report of Spanish casualties published.) Cost to the United States, about 253 men killed and about 1324 men wounded.

What we lost: The Maine, with 266 men.

What Spain lost: Montez's fleet, Cervera's fleet, Cuba, Porto Rico, one of the Ladroneas, and possibly the Philippines.

Strength of the United States army when war was declared, 27,532 men. Strength now, 278,500 men.

Strength of the United States navy when war was declared: Battleships and cruisers, 14; monitors, 19; unarmored steel vessels, 16; gunboats, 19; torpedo boats, 23. Strength now: Battleships and cruisers, 39; monitors, 19; unarmored steel vessels, 31; gunboats, 25; torpedo boats, 25; special craft, 45.

In 1884 the total investment in electrical appliances throughout the United States was not much in excess of \$1,000,000. To-day the capitalization on electrical appliances is fully \$1,900,000,000. In 1884 a 50-kilowatt dynamo was considered a large machine, and the price of dynamos was about 20 cents per watt of output; at the present time the largest size generator built is of nearly 3000 watt capacity, and dynamos in comparatively small sizes, without switchboards, now cost about 2 cents per watt. It is estimated that about \$600,000,000 has been invested in electric lighting stations and plants in the

United States. There are to-day in the United States about 14,000 miles of electric railroad, with a nominal capital of about \$1,000,000,000, and employing about 170,000 men.

How Liquid Air is Manufactured.

An editorial article on "Liquid Air," on page 78 of the issue of July 23, has been widely copied and commented upon.

Following is a condensed account of the construction and operation of the apparatus by which C. E. Tripler of New York produces liquid air in commercial quantities. This liquefier is almost wholly a compressed air plant, a portion of the mechanism as illustrated herewith being understood to be the subject of patent by the inventor.

A steam boiler furnishes steam at 85 lbs. pressure to a Norwalk straight-line 90 H. P. compressor when running at 150 revolutions per minute. This supplies the power.

The steam cylinder is 16x16 inches. There are three air cylinders arranged in tandem with the pistons all on the same rod. The low-pressure

apparatus, therefore, the actual work of liquefaction is performed. There are two of these liquefiers in use in the laboratory apparatus here described. Their operation is substantially as follows:

The comparatively cool air under high pressure enters at one end of the liquefier, where it passes through an arrangement of coils of pipes towards the other end, where there is situated an expansion valve of peculiar construction which permits a certain amount of air to escape into the surrounding casing. This expanding air flows in a direction opposite to that of the entering air, and, in flowing in and about the coils, it absorbs heat from the incoming air, greatly reducing its temperature. This accumulative chilling action of the expanding portion of the air continues to reduce the temperature of that contained in the coils more and more, until at length its "critical temperature" (placed by Dewar at 220° F. below zero) is reached and a portion of the air collects at the bottom of the liquefier in the liquid form, while the remainder flows on, expanding and continuing to exert chilling effect on other portions of entering air. Externally, these liquefiers resemble sections of covered steam pipe, and give no intima-

APPARATUS FOR THE MANUFACTURE OF LIQUID AIR.

cylinder (10½ inches diameter) is double-acting, and raises the pressure from that of the atmosphere to 60 pounds. The intermediate is single-acting (6½ inches in diameter), and compresses to between 350 and 400 pounds. The high-pressure cylinder (2½ inches in diameter) is single-acting, and delivers the air at a pressure of from 2,000 to 2,500 pounds per square inch.

The compressor takes its air supply through a dust separator placed in the roof, thus insuring the admission of clean air. This separator is an arrangement of baffle-plates over which water is constantly trickling. From the high-pressure cylinder the air passes to a cooling tank—a spiral coil of copper pipe surrounded by a steam of running water. The purpose of this device is to carry off the heat stored in the air during its compression. The air passes on then at the temperature of the cooling water. From the cooling coil the air next passes through a "separator," or dryer, the function of which is to remove the moisture contained in it originally and that which it may have taken up in the dust separator and elsewhere.

The next piece of apparatus is what the inventor calls the "liquefier," the function of which is to transform the now cool air—which is at a pressure of about 2,200 pounds to the square inch—into liquid air at atmospheric pressure and at a temperature 312° F. below zero. In this portion of the Tripler

tion as to the duty they perform. The liquid air is removed from the liquefier by opening a valve in the bottom. The laboratory apparatus above described is said to be capable of producing from three to four gallons of liquid air per hour continuously.

Drill Steel.

A well-known steel worker says: The best grade of extra drill steel, as produced by all makers, is hammered to condense its atoms and make it of closer texture. Competition has brought into use among miners a cheaper article, the product of rolling instead of hammering. The rolling process effects an elongation of the particles instead of condensing and refining. The rolled steel is obtained at less cost, but it ultimately costs more owing to its inferiority in drill work.

In preparing drills from hammered steel much depends upon the heating for temper. The drill should be sharpened to as acute an angle as will stand up to the rock to be worked. To avoid breakage heat slowly to a cherry red, getting an even heat on cut of bit, then with clean, soft water dip slowly, taking out drill in time to leave sufficient internal heat to start the temper and toughen the bit, leaving it a light straw color. There is a difference between a brittle-hard and a tough-hard. If you chill in water without starting the temper you get a brittle-hard.

Coast Industrial Notes.

—The seven counties of southern California now figure a population of 333,235.

—The Sacramento river, Cal., has been stocked with 40,000,000 young salmon.

—From Astoria, Oregon, 100 carloads of cold storage fish will be shipped this season.

—Fruit shipments to the East from Sacramento, Cal., August 7th and 8th, were 101 carloads.

—The railway being built over the White Pass, Alaska, will require 18,000,000 feet of timber.

—California's July contribution to the Government internal revenue receipts was \$1,000,000.

—The Marysville, Cal., cannery is packing 60,000 cases of fruit this season and employing 400 people.

—The city of San Francisco's total assessed valuation is \$353,344,001—about \$5,000,000 in excess of last year.

—The Los Angeles, Cal., City Council advertises for bids for the purchase of city bonds to the amount of \$340,000.

—The Los Angeles, Cal., Chamber of Commerce has declared against government acquisition of the Philippines.

—The Monterey & Fresno R. R. purposes building 140 miles of road between Fresno, Cal., and Monterey this season.

—Since April 1st there arrived at Tacoma, Wash., 10,140,120 pounds of tea, on which the revenue to the United States was \$1,014,072.

—A railroad will be built from San Diego, Cal., to Yuma, Ariz., the *Tribune* asserts, by the owners of the sulphur mines on the desert.

—The season's salmon pack at Vancouver, B. C., is 60,000 cases. So far there has been no steady run, and the fishermen are not making wages.

—The railway from Iguala to Cocula, Mexico, will be in operation within thirty days, and from Cocula to Mariscal it will be finished within a few months.

—C. L. Conner of Bakersfield, Cal., is harvesting 10,000 acres of wheat, planted in what was once the bottom of a lake, that is yielding from twenty to twenty-five sacks to the acre.

—The estimated beet output near La Grande, Or., this season will be 50,000 tons. It will take 800 wagons, two loads of two tons each, thirty days to move the product to the factory.

—San Diego, Cal., shippers report a good demand in the East for lemons and a shortage of the crop in San Diego county. They are paying 2½ cents a pound. Nine carloads were shipped last week.

—An olive oil mill and citric acid factory will be erected by E. D. Neff for Andrew McNally of Chicago, on the latter's place at La Mirada, Cal. The building will be of brick and will cost \$12,000.

—The new 650 H. P. engine of the Pasadena & Los Angeles, Cal., Electric Railway Co. is being placed. About \$12,000 worth of copper line has been put in. The improvements will cost over \$50,000.

—According to stock taken last week by the Oil Producers' Trustees, the total quantity of oil in Los Angeles, Cal., above ground, July 30, was 310,000 barrels, showing a decrease since June 30th of 20,000 barrels.

—At Corvallis, Oregon, a trainload of 800 head of cattle is being made up for the North Dakota ranges. The prices paid are: For heifer yearlings, \$12; for two-year-olds, \$15; yearling steers, \$14; two-year-olds, \$18.

—The Chino factory expects to crush the product of 7500 acres of beets this season, of which 4500 acres will come from Chino and 3000 from Anaheim. The new Oxnard factory in Ventura county will work the product of 2000 acres.

—Forecast Official Hammond has a theory that the occasional dry seasons of California are caused by a temporary shifting of the Japan current northward, nearer to the Aleutian islands, thus bringing it to the coast in a cooled condition.

—Nelson, B. C., has sold to the Bank of Montreal \$65,000 city debenture bonds bearing 5 per cent and running twenty years at 98½. The city bought the plant and franchise of the Nelson Electric Co. for \$35,000 each and now owns the light and water systems, which will net \$18,000 a year.

—Prospectors between Copper river and Cook's inlet, Alaska, have abandoned search for gold and are locating coal claims. Lignite is found. Near Graham's bay W. A. Moore found a deserted coal mine that had evidently been worked by Russians before Alaska was ceded to the United States.

—Surveyors are locating the line of the Port Angeles & Eastern railway. It is calculated to have the line in operation from Port Angeles, Wash., to Discovery Bay, and connect with Victoria, B. C., by ferry service, early next summer. The company building the road is composed of Chicago and New York capitalists.

—The Great Northern's new trainmen's schedules went into effect August 1st. Work train conductors' wages have been advanced from \$80 to \$90, and work train brakemen's wages have been advanced from \$60 to \$65. Otherwise the scale is unchanged. The new schedule is really an interpretation of conditions applying to overtime above ten hours, which are uniformly the same on all divisions.

—One result of the present unprecedented dry year in California will be the taking care of water in the Sierras. Water has been so cheap in some parts of the State in the past that none have placed a proper value upon it. It is a time like this that teaches people what

a living stream is worth. The canyons of the Sierras furnish every convenience for storage and all that is required is the placing of dams therein.

—Two Valparaiso corporations, the Pacific Steam Navigation Co. and the South American Steamship Co., are preparing to establish a joint line from Panama north to San Francisco and way points. Their representatives have recently closed a deal with the Nicaraguan government by which they will have a joint line from Panama north to the ports of Corinto, San Juan del Sur and Ocos, the latter being in Guatemala.

—The San Francisco and North Pacific Railway Co. has decided to guarantee 5 per cent interest annually on the bonds to be issued to the California Northwestern Railway Co. for the construction of a line that will be practically an extension of the first named road. The bonds on which interest will be guaranteed will not exceed \$2,000,000, or \$35,000 per mile, for a road sixty miles long. The proposed road will run north from Ukiah, Cal.

—The California Board of Equalization, comparing county assessors' figures, finds that there has been a general falling off of values, except in the mountain counties, these latter having, as a rule, slightly increased their rolls. This is accounted for by the fact that in the mountain counties there has been a considerable development of mines, while in the valley counties there has been a shrinkage in values due to the protracted drought, which caused a shortage of crops.

—Santa Barbara reports striking a rich flow of petroleum at Summerland, Cal. The well was sunk beneath the ocean bed from a platform which runs out on the beach. The new well struck a flow from oil sand at a depth of 325 feet and the oil flows to the surface. There are other wells at Summerland, but they require pumping. This new well of Mr. Treadwell's overflows the pipes and runs directly into the tanks. The well is believed to have tapped the "mother lode" of oil.

—For forty years the officials of the Hudson Bay Trading Co. have been aware of the existence of gold in large quantities in the Klondike. But in the fear of rush of people in that country, as has been going on in the past year, all the employees of the company were positively forbidden to divulge their knowledge of the mineral wealth of the country. It was not that the Hudson Bay Co. had any designs on the gold fields that they enforced this silence. The thing they stood in fear of was that any great influx of men would frighten the fur-bearing animals from their usual haunts. And this is just what has occurred during recent seasons.

—In last week's issue were given some relative figures of cost twenty-five years ago and to-day. The same reduction is noticeable in other lines. At the close of the Civil War a reaper now selling for \$75 cost \$120; a steel plow now costing \$12 sold for \$26; a potato digger now costing \$7 sold for \$25; grain scythes now costing \$9 a dozen cost \$20; binders now costing \$130 cost \$400; mowing machines now costing \$50 cost \$110. As this process of reduction has been going on, the product of American factories in the line of agricultural implements has been generally extended and vastly improved, so that the United States is now not only at the head of all other countries, but so far at the head of all other countries that there has practically ceased to be any serious competition except in respect to the supplies sold by certain European countries to their colonies.

—Considerable money has been spent for government troops' subsistence at the military camp in San Francisco. During July 1996 men were fed. These soldiers cost Uncle Sam an average per man for feeding \$4 63 that month. Following are the items of the food bill:

| Articles. | Value. |
|------------------------------|----------|
| Beef, 251,056 lbs. | \$15,313 |
| Bacon, 65,329 lbs. | 8,153 |
| Flour, 338,644 lbs. | 6,827 |
| Baking powder, 11,614 lbs. | 3,374 |
| Beans, 43,552 lbs. | 980 |
| Potatoes, 232,280 lbs. | 1,370 |
| Onions, 58,070 lbs. | 231 |
| Coffee, roasted, 23,228 lbs. | 3,600 |
| Sugar, 43,552 lbs. | 2,169 |
| Vinegar, 304 gals. | 438 |
| Salt, 11,614 lbs. | 52 |
| Pepper, 725 lbs. | 160 |
| Soap, 11,614 lbs. | 359 |
| Candles, 4355 lbs. | 392 |
| Total | \$43,416 |

—The shingle output of the mills at New Whatcom, Wash., is estimated at 400,000 per day.

—Chicago reports that during the week contracts were let there looking to supplying Tacoma and Seattle, Wash., with electric light and power. The Snoqualmie Falls Power Co. proposes to push the project to a successful completion. Snoqualmie Falls is twenty-two miles from Seattle and about the same distance from Tacoma, in air line, and has an unbroken vertical fall of 270 feet. The flow of the river is theoretically figured to equal 3000 H. P. at low water, and the plan of installation is such that at a small additional expense for dams and reservoirs, the entire drainage from the snow fields of the Snoqualmie watershed of 1000 square miles will be available, making over 100,000 H. P. available whenever the business of the adjacent cities may demand it. The power house is to be hewn out of the solid rock 250 feet beneath the crest of the fall, where the immense water wheels will connect direct with generators, from which the electricity is to be transmitted by wire to Seattle and Tacoma.

—Lyman F. Cooley, after a visit East for a conference in New York with the representatives of the Maritime Canal Co., owners of all the rights and concessions along the proposed route of the Nicaragua canal, believes the Government will construct the great waterway in preference to letting the contract to

separate companies or corporations. Mr. Cooley says that on this point the complexion of the Nicaragua canal matter has been changed perceptibly since last winter, when he, with a party of engineers, looked over the ground of the enterprise. On being shown a dispatch from Washington stating that Admiral Walker, of the canal company, had received a number of reports, indicating that the cost would be much less than heretofore estimated, Mr. Cooley presented a list of recent discoveries, which he believes are responsible for Admiral Walker's opinions. The gist of these are: Six miles of dredging in the lower end of Lake Nicaragua; non-existence of rock in San Juan river to Toro rapids; good foundation for immense dam at Ochoa; favorable conditions for embankments at San Francisco basin; new site for dam at Tanbor Grande. According to the estimate of the formulator, a saving of several millions of dollars is expected in these items. The expense incurred by the Government in war and the rapidly developing indications that the Nicaragua canal cannot only be constructed more cheaply than at first imagined, but ought to be built by Uncle Sam himself, are conspiring, he intimated, to assure the waterway between the Atlantic and Pacific within a few years. "President McKinley," said Mr. Cooley, "and many of the leading members of Congress now appreciate more than ever before the supreme importance of the canal to this country. Senator Morgan said to me not long ago that the annexation of Hawaii practically clears up the question of immediate necessity for the Nicaragua canal. It is a question, however, whether or not Congress will be able to pass the proposed laws or take the proper action at the short session in the fall to enable the work to be begun at an early date. The construction of the waterway will not be a tremendous undertaking, though it may take seven years to complete it. The Maritime Canal Co. asks for \$11,500,000 from the Government to relinquish all its rights and concessions. The company, it is understood, will take \$7,000,000 in the stock of a new company that the Government might form and \$4,500,000 from the Government to validate its bonds. The company bought out all the concessions of the old Nicaragua association, which is said to have expended something like \$6,000,000. The Maritime Canal Co. was then organized and it has spent \$2,000,000 in Nicaragua on the canal, but has to quit work. The company is perfectly right when it says that no private corporation could be expected to take up the canal project now since Congress has put its hand in the matter and when there is a strong likelihood of the Government building the ditch itself. It is not definitely known that the commission will be ready with its report during the short session of Congress. A report may be submitted, and may cause a vast difference of views as to what course should be pursued. Senator Morgan and all other canal advocates appreciate these things, but the manifest broadening of the scope of our national policy of late has impressed every one so strongly that none can see any obstacle large enough to prevent the construction of that which will be an invaluable holding and possession of the United States in time of peace and in time of war."

Obituary.

Adolph Sutro.

Adolph Sutro died at his home in San Francisco on the 8th inst., aged 68 years. A native of Aix la Chapelle, Prussia, he came to California in '50, engaged in mercantile pursuits in San Francisco for eleven years, then went to Nevada, where the Comstock lode was beginning to attract attention. He started a custom mill at Dayton, Nevada, and rapidly made money. While there he conceived the idea of tunneling the Comstock, organized a company capitalized at \$5,000,000, and, after a series of defeats and opposition that would have dismayed a less energetic man, he succeeded in getting a bill through Congress authorizing its construction. Work began on it October 19th, '69, and it was pushed steadily for nearly nine years to completion. As the time went on it became evident that the royalty on Comstock ores would not be as fruitful a source of revenue as had been anticipated, for even twenty years ago the great lode showed signs of depletion. In '79 Sutro sold almost his entire interest in the great tunnel that bore his name, and with a fortune estimated at \$5,000,000 came to San Francisco, bought one-tenth of the city area, a portion of which fronting the ocean he proceeded to beautify and adorn. He spent great sums in turning what was a sand heap and rugged cliff into one of the handsomest gardens in the world, and in later years built what are believed to be the largest and finest baths on the continent, built and equipped an electric line of railway from the city thence, and bestowed various public bequests. In '95 he was elected Mayor of San Francisco.

He was a man of intense impulse and indomitable will; self-reliant, successful, a born fighter and would have made his mark and filled a notable place in any department of life that he had essayed to occupy. It is thought, had not his mental powers failed during the last few months, that he would have willed his great library and fine pleasure grounds to the city that had honored him and in whose welfare he had so large a part.

The mother of Herbert B. and Henry Waterman, of the Hendrie & Bolthoff Mfg. and Supply Co., died in Denver on the 31st ult. The funeral took place on the 1st inst.

Commercial Paragraphs.

ABOUT twenty-five mechanics of the Lacy Manufacturing Company of Los Angeles, Cal., have gone to San Bernardino to build an oil tank for the Santa Fe, which will have a capacity of 36,700 barrels.

Personal.

B. SMITH, Supt. Star mine, Columbia, Cal., is in San Francisco.

D. H. ANDREWS becomes Gen. Mgr. La Cigale mine, Mercur, Utah.

J. CONANT a mine operator at Scott Mountain, Cal., is in San Francisco.

J. R. THELOAN a mine operator at Amador City, Cal., is in San Francisco.

J. L. FLOOD of San Francisco is at his Allison Ranch mine, Grass Valley, Cal.

W. R. CHADBOURNE, Mgr. Lindsay mine, Maybert, Cal., is in San Francisco.

S. NEWHOUSE is expected to reach Salt Lake City, Utah, from Mexico about Aug. 15th.

C. A. BROCKINGTON, Supt. Orleans mine, Grass Valley, Cal., is at Bartlett Springs, Cal.

C. B. WINGATE, Mgr., Chloride mine, Junction City, Cal., has returned to San Francisco.

H. D. DERWIN succeeds A. Smith as Gen. Mgr. Barstow Reduction Works at Barstow, Cal.

F. J. FLETTER, Pres. Brunswick Con. M. Co., Grass Valley, Cal., has returned to San Francisco.

JUDGE SPINKS of Rossland, B. C., has appointed W. A. Carlyle receiver of the Le Roi mine.

G. FAIRFOWL has been appointed U. S. surveyor to sample and assay ores at Everett, Wash.

G. SCHMITT, managing owner National Con. mine, Redding, Cal., has returned from San Francisco.

W. J. O'MEARA of the Carissa mine, Tintic, Utah, who has been visiting in California, has returned home.

P. RYAN, Mgr. Crown Point M. Co., Park City, Utah, has returned from the East to Salt Lake City.

A. KORBEL, Pres. Texas M. Co., Nevada City, Cal., has returned to San Francisco from a trip to the mine.

W. OGILVIE has been appointed commissioner for the Yukon district of the Northwest Territory, Alaska.

W. PELLEW HARVEY has resigned the position of consulting engineer to the Associated Gold Mines of B. C., Ltd.

COMMISSIONER OF PATENTS DEUEL is in San Francisco from Washington. He expects to spend some time in California.

I. GUKER, owner Great Northern mine, Grant county, Or., will take up his permanent residence in Salt Lake City, Utah.

F. N. GUILD, professor of mineralogy in the University of Arizona, has returned home from his trip to California and British Columbia.

W. L. HONNOLD has been appointed Supt. Thorpe mine, Fourth Crossing, Cal. He will continue as Gen. Supt. California Exploration Co., Ltd.

CHAS. BUTTERS has returned from Kennet to Oakland, Cal. He has placed E. Fritz in charge of the cyanide plant he is building at Kennet, Cal.

GEO. P. THURSTON of San Francisco, Sec. Orleans M. Co., Grass Valley, Cal., has taken charge of the mine during Supt. Brockington's absence.

J. P. EVANS of the Colorado Iron Works Co., Denver, Colo., accompanied by his wife and daughter, sailed from San Francisco for Mexico last Monday.

F. B. LATHROP of Minneapolis, Minn., has returned to San Francisco from Placerville, Cal., where he has been examining mining properties with a view to purchase.

DR. KEMBALL and his Government Geological Survey party which has been operating on the upper Yellowstone, has reached Cooke City, Montana, and will devote a month to that vicinity.

THOS. J. HURLEY of the Exploration Syndicate left Silverton, Colo., for New York City last week, whence he goes to Mexico to examine mining properties. Thence he goes to London, England.

DR. H. S. PRITCHETT, Supt. U. S. Coast and Geodetic Survey, is in San Francisco, en route to the Hawaiian Islands, under direction of the Secretary of the Treasury to look after the conditions of the surveys of the islands.

WM. THOMPSON, representing the London Chamber of Mines, London, England, has arrived at Ottawa, Canada, to secure the cooperation of Canada towards the Imperial mining exhibition to be held in London next year.

Recent California Mining Incorporations.

Aurora Gravel M. Co., San Francisco; capital stock, \$27,000, subscribed, \$700; G. H. Hawes, C. E. Kelly, E. J. Mott, B. M. Wilson. Homestake M. Co., San Francisco; capital stock, \$250,000; L. W. McGlaulin, I. N. Chapman, W. Burchett, T. Pozzer, W. R. Pozzer.

Dewey G. M. Co.; capital stock \$100,000, subscribed \$500; T. F. Morse, M. D. Howell, W. L. Brown, F. S. Myrtle, S. Salomon.

Keystone D. Co., San Francisco; capital stock \$100,000, subscribed \$25; B. F. Hand, C. H. Wegener, S. Godenough, R. Garvey, R. F. Morton.

Recently Declared Mining Dividends.

Pennsylvania, Cal., 5 cents per share; payable immediately.

Grand Central, Utah, 12½ cents per share, \$31,250; payable Aug. 15.

Silver King, Utah, \$37,500; Aug. 10.

American Enterprise Abroad.

The Westinghouse Machine Company and the Westinghouse Electric and Manufacturing Company, on July 30th, invited a number of prominent engineers to their works at East Pittsburgh, to inspect some remarkable new engines and electric apparatus which are about to be shipped to England. The visitors saw three 2500 H. P. electrical generators, direct connected to three 2500 H. P. engines, which were constructed for the Metropolitan Electric Supply Company, of London.

There is a peculiar significance attached to the destination of these machines. It is no new circumstance that England sends to America for electrical apparatus, but it is a new circumstance that England sends to America for large steam engines, and this at a time when all the world is talking about the probable expansion of American trade.

The Metropolitan Electric Supply Company is the greatest electric lighting company in Europe, and their present contract with the Westinghouse interests calls for "three compound two-phase steam alternators," each consisting of an enclosed vertical compound engine with the armature of the generator coupled direct to the engine crank-shaft, the engine and generator being mounted on separate bed plates. The engines and generators are so designed that the full output can be obtained at any speed from 116 to 145 revolutions per minute, this range of speed being necessary in order to provide a variation in the frequency of the alternations, and thus enabling a supply to be given to existing transformers in London.

The engines are of the enclosed vertical compound marine type and are the most powerful engines yet made at East Pittsburgh.

The electrical apparatus built by the Westinghouse Electric and Manufacturing Company, accompanying these engines, consists of three direct connected alternating current generators, each having a nominal output of 2000 H. P. and delivering two-phase currents at a pressure of 500 volts. The armature, or the revolving element, of each generator, as before mentioned, is mounted directly on the engine shaft. There is one direct current multipolar exciter to each generator, which is arranged for direct connection to the engine shaft. This plant is to supply primarily arc and incandescent lighting to London, but a portion of the power is to be used for operating rotary transformers, which in turn supply current to direct current motors, and for charging storage batteries by the three-wire D. C. system.

The Westinghouse Machine Company has successfully built a 650 brake H. P. gas engine. This engine has three cylinders, each 25 inches in diameter, and a 30-inch stroke, and runs at 145 revolutions per minute. Its economy is very marked, resulting in the production of a brake horse power for 11 cubic feet of natural gas. This is the largest gas engine in the world, and it operates with complete success.

A Parsons steam turbine driving a 200 H. P. alternating current generator was particularly interesting to the visitors. This turbine is a somewhat new form of steam engine, although extremely old in principle. It makes use of the high velocity attained by steam in passing through an orifice from a higher pressure to a lower, and acts much in the same manner as a water turbine. The Westinghouse Machine Company have spent much time and money experimenting on this subject, and are now in a position to build Parsons turbines, which give phenomenal results as compared with ordinary steam engines.

The Parsons turbine is a similar type of engine to that fitted on a little boat named the *Turbinia*, which has lately been creating such a sensation in England by its remarkable performances. The engine consists essentially of: 1. A barrel, in the internal bore of which are fitted numerous rows of turbine blades. 2. A shaft, which revolves within the above barrel, having

complementary blades fitted to the periphery. 3. Bearings. 4. Lubricating and governing devices.

The barrel and shaft together form a series of hundreds of complete turbines. The steam passing from one to the other expands itself and does work in each set until it arrives at the exhaust end, when it is entirely devoid of energy, by this means utilizing the steam to its utmost limit, and producing remarkably economical results.

The turbine on exhibition runs at 4700 revolutions per minute without any perceptible vibration.

The Globe Battery Stem Guide.

The Globe battery stem guide illustrated herewith is meant for a guide for the stems, and not a bearing. It is exclusively of iron, the back is one solid piece bolted to the guide beam. Any one stem can be removed without reference to the others. Among other

GLOBE BATTERY STEM GUIDE.

points of excellence it is claimed that these guides will not score or cut the stems; they are so constructed that the stems have little play in the boxes and move with no perceptible vibration, aiding in the even wear of shoes and dies and minimizing the tendency to breakage. The guide complete for a 5-stamp mill weighs 165 pounds. The Globe Iron Works, Stockton, California, U. S. A., manufacture and sell these guides and will send a catalogue, etc., to anyone interested therein.

Cutting a Cable at Manila.

As a necessary war measure, Admiral Dewey found it advisable to cut the cable from Manila to Hongkong to destroy telegraphic communication between the Philippines and Spain. Immediately after the naval battle of Cavite, Admiral Dewey proffered reasonable terms under which cable commu-

nication could be maintained, but at that time the Spanish general supposed that Admiral Camara would soon appear and hence haughtily declined any terms. Accordingly, the cable was severed.

The cutting of the Iloilo cable in Manila bay took place at 7 o'clock on the morning of May 23rd. Iloilo is an important point on the island of Panay, almost directly south of Manila. The cable connecting these points was cut by the crew of the American transport *Zafiro*, which grappled the cable in Manila bay. The accompanying illustration graphically representing the

crew at work was made from a sketch drawn by John T. McCutcheon, the *Chicago Record's* artist with Admiral Dewey's fleet. Aside from the natural interest in the event represented, the sketch possesses some historic merit. The cables of the world play an important part in war and peace. For the last two weeks the cable between New York and Madrid has been loaded with dispatches consequent upon the peace negotiations, and that desirable event has been greatly hastened thereby.

There are now twelve transatlantic cables connecting Europe with Canada and the United States, and steps have been taken to lay a cable across the Pacific from British Columbia to Australasia by way of the Fiji islands. The circle of the earth will then be completed, but not so directly as it would be by a cable from America to Japan. There are now 152,000 miles of submarine cable in round numbers, of which

10 per cent have been supplied by various governments and the rest by private enterprise. They connect into one system over 2,000,000 miles of land wires, ramifying in different countries. The cables have cost about \$200,000,000 and the land lines \$325,000,000. Telegraphy controls the commerce of the world, which has risen to nearly \$20,000,000,000 a year. It has enabled international disputes to be settled without recourse to arms, as when the British cabinet was in direct communication with the Boer leaders of the Transvaal. It brings a war that has broken out to a speedy conclusion, as in the present instance, and keeps the public informed of its hourly progress, as in the case of Egypt, where the bombardment of Alexandria was known in London a few minutes after the first shot was fired, and telegrams were dispatched from the battlefield of Suakim in the eastern Soudan, while the fight

CREW FROM AMERICAN TRANSPORT ZAFIRO CUTTING CABLE IN MANILA BAY.

was going on, and in the battle at Manila, 6000 miles away, the result being known within the hour. Above all, by putting the remotest parts of the world in contact with each other, it tends to destroy the barriers of isolation and prejudice, making antipathy give place to sympathy and hatred to kindness.

To Dissect a Piece of Coal.

M. H. Couriot suggests that the X rays may prove as efficient in showing the intimate structure or siliceous skeleton of our coals as they are in de-

fining the calcareous skeletons of animals. He states that by means of a powerful Crookes tube and a fluorescent screen it is easy to determine the purity of a fuel. Carbon in all its forms is transparent to the rays, while silica and silicates are opaque, and on placing a lump of coal between the tube and the screen, all the intimate details of the slag and clinker forming details of the fuel at once appear. M. Couriot has tested in this way anthracite coal, lignite, peat, coke and block fuel. The finest particles of silicate, though quite visible to the eye, show up at once on the screen as dark spots or bands upon a bright ground. The differences in the quality of a series of coals can be traced step by step showing at once the variations in the purity of the fuel. The conglomerate structure of block fuel is clearly exhibited, while with coke the particles of iron sulphide are indicated by black spots on the fluorescent image. Carbon is so transparent that it is unnecessary that the samples should be regular blocks, as rough lumps, the sides of which usually follow the natural planes of cleavage of the coal, serve perfectly well. M. Couriot has taken radiographs with specimens 1½ inches to 2 inches thick, the coil used having a spark 10 inches long, and the exposure being five minutes.

A Wonderful Product.

The consumption of corn for glucose in America is now over 100,000,000 bushels annually. In the glucose manufacturing process are derived not only mixing confectioner's and brewer's glucose, for which the uses are enormous and constantly becoming more varied, but among the by-products are dry starch, which serves wide domestic purposes, dextrin, used in glazing paper, for glue and mucilage and for sizing in paint works, and grape and anhydrous sugars used in the manufacture of beer, wines, cordials and vinegar. Altogether there are thirty-two different products derived from glucose manufacture.

New uses have recently been discovered for the heretofore waste cornstalks, which can be turned into valuable merchantable products, chief of which are cellulose and live stock feed.

The famous maguay plant of Mexico which supplies the peon with his hut, his hat, his fibrous clothes and shoes, his whiskey and his food, in addition to a number of other uses, is outdone in extraordinary economic versatility by the manifold uses to civilization of the corn plant.

So long as the world's visible supply of wheat continues short, the American farmers will supply Europe with high-priced wheat food. But indeed lasting are the conditions which are making of the cornfields of this country veritable mines of golden wealth.

Argentina and the Balkan States are the only districts in the world which have ever even been humbly able to dispute America's monopoly in corn production. Not only is "corn king"—but nature's territorial restrictions are such that America must forever continue to be the capital of corn's realm.

The Class of Readers Counts.

Has it ever occurred to you that the kind of circulation is of some importance? Is a circulation gotten by the forcing process, by sledge-hammer solicitation, by all sorts of subterfuges, premium schemes and gift enterprises, worth as much as a circulation founded on the intrinsic merits of the reading matter of the publication—a circulation that has grown of itself?—H. J. B., in Advertising Experience.

Mining Summary.

CALIFORNIA.

Amador.

Record: At the Potazuba mine, near Sutter, they have a 4-foot ledge at the 100-foot level of \$100 a ton rock. One hundred tons will be put through the mill as a test. Sinking continues at the Anita, at Jackson, and, though the rock is hard, good progress is made. A depth of 700 feet has been reached, and it is intended to go 300 feet deeper before sinking. The deal entered into last fall by which the Amador Queen No. 2 mine, at Jackson, was to become the property of Chicago capitalists, has been made, and W. N. Bardue has disposed of his interests to a company called the American Improvement Co. Money will be expended in the development of this mine. The repair work on the Zeile shaft will take all of August. Sinking will be commenced in September. They are taking out rock, but the mill is not running steadily. Five stamps are dropping on rock from the Oneldama mine.

Dispatch: Owing to lack of water, operations are suspended at the Reard mine, in Pine Grove district. The shaft is 150 feet deep. F. B. Livingstone is opening the old Telurium mine. The shaft, which was sunk years ago, is down 300 feet. The Kennedy Co. has felt the effects of a scarcity of water. Supt. Parks is apprehensive that the mill will be obliged to remain idle, or partly so, quite often during the remainder of the season. One day last week he was obliged to hang up twenty stamps.

Butte.

March & Co. are developing a mining property on Butte creek, in the Centerville district. They have opened a cut 400 feet in length, put in a 10-foot water wheel, which hoists the water for sluicing.

A gravel mine is soon to be opened near Lovelock. M. Wright of Nevada county has been examining the property for San Francisco people and hopes to begin work shortly.

West & Cummings, near Lovelock, have completed a ditch and 2500-foot pipe line, and have obtained a permit to hydraulic. They will work on 200 acres of gravel which yielded fair pay in prospecting.

Calaveras.

The Cal. Expl. Co. has bonded the Thorpe mine, at Fourth Crossing, and begun work. The Expl. Co. pays \$25,000 cash, and \$200,000 within a year. They begin within thirty days a two-compartment shaft 600 feet deep, and a second shaft in accordance with the laws of California, and the erection of a 30-stamp mill. On completion of mill and 600-foot shaft, reducing of ores shall begin. Should second party elect to defer second payment two years, they must sink 400 feet in 600-foot shaft at rate of 100 feet in six months.

El Dorado.

(Special Correspondence).—The Poverty Point mine near Placerville is pushing development on the tunnel.

The Gentle Annie mine is opening up some good ore bodies.

The Hall Consolidated has an extension on its bond and work will be pushed.

The Gold Bug M. Co. is working on the Ida Mitchell lode. Cleaning and retimbering the old shaft and tunnel is finished. The company has bought four acres, additional to the two mines, upon which a hoist and shaft house will be built.

Work on the electric power plant and new mill at the Griffith, at Diamond, is progressing. Electric power will be supplied by the plant projected by J. J. Crawford.

The Larkin is sinking the shaft from the 300 level and is in a good ore body.

E. W. Chapman is spending money on machinery in the development of the Gold Note and Philadelphia properties. At Omo Ranch he put in a fine plant.

E. A. Stent, it is stated here, has bought the Lemmon property near Placerville.

The Diamond property is producing good ore in its development. A thorough test to depth is to be made of this mother lode property. Placerville, August 9th, '98.

Near Fairplay the Uncle Sam mine has two shifts employed and is meeting with success. At the Sig Gulch mines men are doing development work preparatory to winter operations. The river claims are ceasing work until autumn for want of water for sluicing purposes.

At the Taylor mine near Garden Valley six cyanide tanks are being added to the fourteen now in operation. The Gentle Annie mine near Placerville has closed down for lack of water. It is thought work will be resumed in four weeks when the demand for water for irrigating purposes will have ceased. Preparations are being made for resumption of work at the Unity mine in the Webber Creek district.

At the Vandalia mine near Shingle Springs they are working twenty tons of ore a day by the cyanide process. At the Larkin mine, Diamond Springs, the mill has ceased crushing because of scarcity of water, but development work continues. Richardson & Klepper are hauling ore from the Alta Vista mine near Grate Hill to the custom mill in Placerville. At the Crown Point mine, Diamond district, the tunnel is 500 feet, sinking has resumed.

Kern.

J. M. Waugaman has sold his mines on Greenhorn mountain to G. A. Bobrick for \$45,000. The mines are the Mayflower, Rose and Plymouth.

A mill run of four tons of ore from the Gold Coin mine at Randsburg went \$208 per ton. In the Black Hawk a 12-inch ledge was uncovered on the 70-foot level. A good discovery is reported from the O. K. mine. A

mill run of twenty-five tons of ore is being made from the Golden Rule mine. Twenty-one tons of ore from the Sunshine mine at Johannesburg, treated at the reduction works, yielded \$2400.

The latest discovery at Randsburg was an ore body in the Little Butte shaft, the deepest in the camp, at a depth of 480 feet, carrying \$15 in free milling gold and \$90 in the sulphurets to the ton. The Wedge mine produced \$30,000 and the Butte \$45,000 after their ore bodies were said by experts to be exhausted.

The Golden Rule mine at Johannesburg is shipping ore to both Eureka and Red Dog mills. Machinery and tanks have arrived for the cyanide plant at Garlock. The plant will have a capacity of sixty tons per day and it will take about a year to clean up the tailings at Garlock.

Forty tons of rock from the Norvell mine, in the State range, are being crushed in Garlock from which good results are expected.

Randsburg Miner: The Yellow Aster M. Co. cleaned up \$35,370 at the Barstow mill last week, the result of the last half of July. In the middle of the month they cleaned up \$28,000, making with the last clean-up \$63,370 for the month. This is the largest run ever made in one month by the company. They are now working in a solid ore body in the Tribby mine, more than 40 feet thick, and milling every pound of it. The last clean-up was principally from Tribby ore and averaged, as near as they could estimate it, \$43 per ton. Their July dividend will be \$25,000, and this notwithstanding some heavy expenditures in water development. Their new pump, engine and boiler is on the way, and as soon as they are in place water development will again be carried forward. The pump has a capacity of 100,000 gallons in ten hours. The pipe line is 5-inch and the calculation now is to put up a 40-stamp mill, instead of thirty, as first contemplated. The pumping plant, wells, pipe line and tanks involve an expenditure of \$70,000. Work on the tank at the wells is going on. The ore being taken out is about 350 feet from the surface perpendicularly. The new Hercules tunnel, now in 800 feet, will strike the vein at a perpendicular depth of 600 feet.

Mono.

The Standard Con. M. Co., which absorbed the old Bodie Con., Bulwer Con., Mono and Summit mines, has no intention of reducing the par value of its capital stock. Nearly all the stock is held for investment purposes in the East, and as very little is changing hands in the market, the war tax on transfers cuts but a small figure. The Standard Con. will pay a dividend of 10 cents per share next Thursday.

The Standard Consolidated Mining Co. has made a bullion shipment valued at \$23,000, the cleanup on the July account.

Napa.

St. Helena Sentinel: During July the following were the quicksilver shipments from mines in this locality: Napa, 600 flasks; Etna, 300; Great Western, 146; Vallejo, 23; total, 1069. This is an increase of 168 flasks over the June shipment.

Nevada.

The hoisting works of the Granite Hill M. Co., Grass Valley, were destroyed by fire last week. Supt. Phillips says they will be immediately rebuilt.

At the Odin mine near Nevada City the water has been turned on and the new machinery started for sinking to bedrock. Improvements which will cost over \$85,000 are being made by the North Star M. Co. at the Massachusetts Hill power house near Grass Valley. The foundations are being laid and thirty men are doing the concrete and masonry work. It is proposed that the power necessary to run the Massachusetts Hill, Central Star and North Star mines shall be generated at this point, the motive power to be compressed air. Two compressors will be installed, to be operated by a water wheel 33 feet 6 inches in diameter. A large dynamo will also be placed which will be run by a water wheel 7 feet in diameter. Work at Bedrock tunnel of the Malakoff mine at North Bloomfield, which is being run for drift purposes, is progressing.

Telegraph: At a meeting of the board of directors of the Pennsylvania M. Co., Grass Valley, enlarging the mill was discussed and it is probable that ten more stamps will be added. Weissbein Bros. & Co. have bought from W. H. Martin the Federal Loan mine near Nevada City for \$8000.

Transcript: P. Tautphaus and the other owners of the Constitution and Great Western mines near Nevada City are making arrangements to start work. It is expected that the two ledges will come together at a depth of 300 feet. A chlorination plant is talked of in Grass Valley, to cost \$25,000.

Union: Supt. Shockley reports progress at the Phoenix mine, Nevada City. It is expected that the new 10-stamp mill will be in operation September 1st, when the several hundred tons of ore on the dump will be crushed. The building over the mill is completed and most of the heavy timbers are in place. Some of the machinery has been put in. The building will be painted inside and out and there will not be a more presentable looking mill in the county when it is completed. Putting in the new 10-inch plunger pump is going on. A strong ledge is shown and the Phoenix bids fair to become one of the leading mines hereabouts.

Transcript: The Providence mine, Nevada City, is said to be looking better than ever.

Herald: The Manzanita Mining Co., at Nevada City, have wound up their affairs and business. A dividend for a trifle less than 7 cents per share was declared.

Riverside.

Los Angeles Record: The Good Hope mine, between Riverside and Elsinore, several years

ago, was sold to an English syndicate for half a million dollars and \$100,000 paid down. A scientific gentleman in geological matters was sent from London as Supt., and everything looked well. Suddenly the supply of gold-bearing rock began to decrease and the shareholders brought suit to get back their money, on the ground that misrepresentation had been resorted to in the sale of the property. The defense contended that the purchasers had sent experts of their own. Recently the workmen ran into an ore body 50 feet wide at a depth of 600 feet. The rock is low grade, but said to be rich enough to crush at a profit, while the extent of the deposit guarantees that it will not soon be exhausted.

San Bernardino.

The capacity of the Barstow mill is 150 tons a day, and it is said they could handle more ore at the mill than they are getting. The Yellow Aster Co. of Randsburg utilize thirty out of the fifty stamps.

At Dale there are few men taking out ore, nor will there be many before September. There is no one working in the placers. It is estimated that there have been \$25,000 taken out of the placers in fifteen months; they will be worked this fall.

Shasta.

F. Aplin, in the Mad Mule mine, at Whiskeytown, in a contact of porphyry and manganese, took out \$1300 of honey-combed gold, free from quartz, of which several pieces were large as hen's eggs.

At Bragdon miners on the river are cleaning up on their first run. The river is low. Rogers & Thresher are sinking on their quartz prospect with success. M. Van Ness is putting in an arrastra mill, with the intention of working the accumulated tailings of his mine, and then the quartz as it is produced.

Siskiyou.

The Hazel mine at Cottonwood, operated by Jilison & Co., continues to pay; the 13-stamp mill is supplied with plenty of water. The ledge averages 3 feet in width.

Capt. Roberts has just finished a 10-stamp mill on the California Queen, two miles west of Hornbrook, and is running on high grade ore. He employs fifty-five men.

The Brown & Reeder quartz mine, in Fool's Paradise district, was started up by J. F. Boyle, the receiver appointed by the court, pending litigation. The river miners on the Klamath are crowding workday and night and have been taking out considerable gold.

The Eastern Co. prospecting Yreka creek basin from Shasta river to Yreka, has begun sinking prospect holes on the McNulty place. It will probably take three months to complete the prospecting in the basin bonded and purchased.

The Morrison & Coburn mill in Quartz Valley has started up. Jones & Daniels, at Quartz Valley, made a clean-up of fifty pounds of bullion.

Trinity.

G. L. Carr has driven a tunnel 845 feet in his Boulder property near Cinnabar. J. Conant is pushing work in his property at Scott Mountain. He has a ledge over 7 feet wide that gives encouraging prospects.

The Strode mine, near Trinity Center, is running only a day shift to keep the 5-stamp mill in operation. P. Holland is making his clean-up on Coffee much earlier than usual because of the scarcity of water. The Wedge mine is working a ton of ore from a 4-foot ledge every twenty-four hours. The property is owned by Truax & Co. They intend putting in a 5 or 10 stamp mill this autumn. Good ore has been struck in the lower levels of the Chloride-Bailey mine on Canyon creek. About seventy men are employed. R. A. Skinner has bought from the Niagara M. Co. the Yellowstone group of mines in the East Fork mining district.

Tuolumne.

Independent: The Longfellow mine at Big Oak Flat has paid all indebtedness, will build new hoisting works and put everything in shape for work. The Moody is putting in a 5-stamp mill. Mt. Jefferson at Groveland has its hoist completed and is pushing work. Tuolumne river is about all taken up in placer claims and are being worked with varying success.

Tuba.

At Brown's Valley work on Pennsylvania mine is progressing. The water is out 400 feet, and Mgr. Campbell thinks, if his pumps work well, he may see the bottom of the shaft in about ten days, when stoping and milling will begin.

NEVADA.

For the first time in nineteen months the Eureka Consolidated Mining Co. of Eureka district, Nevada, has made an assessment. This time a 20-cent one. The Eureka Con. has paid a total of \$5,112,500 in dividends and has levied \$575,000 in assessments. The Erye, at Tuscarora, marketed a load of ore which gave four and one-half ounces gold and ninety-five ounces silver per ton; it is the first from that locality. The property is an old one that was idle for several years.

In the Sulphur mines, near Lovelock, about eighty men are at work. The twelve-mule teams are hauling sulphur at Humboldt delivering twelve to fifteen tons per day. It takes four days for teams to make the round trip from the works. About \$5000 a month is being distributed for labor and supplies. It is said that operations are being planned on a more extensive scale. The ore carries about 45 per cent sulphur.

The Silver State of the 8th says: "The Peck concentrating plant at Empire, Ormsby county, of which so much was expected, was sold for taxes this morning. It is assessed at \$5000."

OREGON.

The Elkhorn M. & M. Co., F. Pfau, Mgr., is doing development work at Elkhorn moun-

tain. A crosscut tunnel is expected to be run 1500 feet.

Work on a large scale has resumed at the Braden mine near Jacksonville. Browning & Hannum of the Greenbank mine near Grants Pass cleaned up \$3700 from thirty-two tons of ore. On the Applegate property, bought by G. E. Morse & Co. of San Francisco, work has begun. Jones & Co. will have their stamp mill at Glendale running by Sept. 1st. R. W. Jones is in charge of the properties. A. M. Jordan of Cripple Creek has bonded the Homestake mine near Woodville and will put twenty men at work. In the Denny group of mines on the Baisley-Elkhorn mountains, eastern Oregon, a good 4-foot body of ore has been found. At Baker City the Beaver M. Co. purchased from Berry & Bartlett the Phoenix mine for \$20,000. The Sugar Pine mine near Grants Pass has been bonded to E. F. Wallace & Co. for \$4000. They have begun work. W. K. Rogers of the Oregon Bonanza mine received a return from the Selby Smelting Co. on 116½ pounds of ore, \$155.32. He has seventy sacks more of the same kind of ore, which is of a refractory nature, and the gold can be secured only through a smelting process.

The Sugar Pine quartz mine at Grants Pass is showing well. The company will drive an extensive tunnel to tap the ledge 1000 feet below the surface.

The Lance M. Co., near Jacksonville, is putting in a pumping plant to utilize the waters of Rogue river. The enterprise promises to be successful, despite the obstacles it has met.

Kubli Bros. started their stamp mill at the Golden Standard mine, near Ashland. They expect to crush four tons per day.

Baker City Democrat: The Golconda at Bourne has fifty men at work. The La Bellevue has the same number. All over the Robinson section there are many miners at work. The Collateral is putting on forty men. At the Eagleton, where the Bementa have started extensive operations, fifty men will be employed. There are employed at the Virtue and Collateral mines about thirty miners. Mgr. Geiser of the Bonanza mine deposited several thousand dollars in gold bricks at the bank last week for shipment to the U. S. Mint.

Courier: Last week W. H. Brevoort of New York, Prest. of the Victor M. Co. of Cripple Creek, Colo., W. J. Cartan of New York and F. T. Sutherland of San Francisco bonded the Browning & Hannum mine on Grave creek, near Grants Pass, for sixty days for \$100,000. Work of development will begin at once.

WASHINGTON.

In the Old Dominion mine, at Colville, six men are clearing out and retimbering the 4000-foot tunnel, preparatory to resuming work on the mine on an extensive scale. Fifty men will be put on as soon as this preliminary work is completed. On the Butte & Boston, at Republic, the drift was extended 70 feet last month. It is in 290 feet. At Colville the Leadville mine has broken into an 8-inch vein, which assays \$43 40 in gold. At Northport, the Castle mine, at a depth of 100 feet in the shaft, came into 8 feet of ore composed of copper and galena. Only assays on silver have been taken, and those on samples of low-grade ore. These assay fifteen ounces in silver.

The Republic mine, at Republic, produced \$63,000 worth of ore in July. The shipments to the smelter were 293 tons averaging \$174 to the ton, making about \$50,900, and the product of the mill was \$12,000. The haul was eighty-five miles from Republic up to British Columbia and then down to Marcus to the railroad.

BRITISH COLUMBIA.

The Golden River Quesselle Co. of Cariboo had placed a large order for machinery with the B. C. Iron Works at Vancouver for use on the South Fork river bed and were depending on getting in the same shortly. The failure of the Iron Works Co. some weeks since has caused a delay in the procuring of the machinery, it being now on its way from San Francisco. Among the lot are three heavy engines and three boilers, hydraulic elevators and other machinery to the amount of sixty tons. After its placing, work will begin at mining the river bed.

A Victoria dispatch says considerable activity prevails in the mining industry on the west coast of Vancouver island. Fully 300 men will be employed next month in the vicinity of Alberta and Clayoquot.

From Texada island, 100 miles north of Vancouver, comes the report that W. D. Rockefeller's Everett smelter foreman is there with large gangs of men ready to open up vast deposits of iron ore and ship it to Everett, Wash. Rockefeller, it is stated, has purchased the well-known iron mines of that island, which have been lying idle for want of capital. "The mines were bought for a song, the owners not knowing who Rockefeller was."

The clearances at the Kaslo custom house for July were: Ore, gross lbs., 4,622,000; value, \$187,631; lead contents, lbs., 2,230,015; silver contents, ozs., 231,415. The Nakusp clearances were: Ore, gross lbs., 2,697,604; value, \$99,384; lead contents, lbs., 953,910; silver contents, ozs., 119,010. The ore shipments over the Kaslo & Slocan railway from July 30th to Aug. 3rd inclusive, were 230 tons.

Rosland Miner: In the struggle for the possession of the Le Roi mine between the majority and minority shareholders one of the regrettable features was the discharging by Receiver Carlyle of 170 men. This was done to stop shipments of ore to the Le Roi smelter at Northport. The receiver deemed this advisable as shipments there would send the ore outside of the jurisdiction of the courts of the province, and would place the product of the mine at the mercy of the U. S. and of the State of Washington. It was, therefore, decided not to take out any

more ore until the differences that have arisen have been passed on by the courts.

ALASKA.

The Lucky Chance mine at the head of Silver bay, which has on it a 5-stamp mill, has been bonded by the Lake Mountain M. Co. to E. O. Smith of Sitka for \$50,000. Mr. Smith will conduct active operations on the property at once.

A desperate stampede is reported from the Copper river country to the coast, the statement being made that 3000 men are making their way over the Valdes glacier and that many of them are doomed to starvation unless the United States Government sends relief promptly.

UTAH.

The Swansea of Silver City and the Erie of Bingham each made a shipment last week of high-grade ore. The Geyser-Marion of Mercur shipped 700 pounds of auro-cyanides last week. The leaching of ore has begun at the Golden Star, near Bingham, and the shipment of cyanides will commence early in September. In the Geyser-Marion a vein has been opened 10 feet in thickness carrying fair values, though most of the ore treated at present comes from the old Marion workings, in which the values run \$8 a ton. Sixty-five men are employed and the amount of ore treated is 150 tons a day. Bingham shipped 3319 tons of ore in July. Silver City ore shipments last week were twenty-two carloads. Since the concentrating mill started in August, '97, on the Old Jordan and Galena at Bingham little development work has been done. The mill has run steadily, treating 125 tons daily. From near Marysville thirty tons of antimony have been shipped to Jersey City, N. J.

IDAHO.

At the Twin Springs Placer Co.'s mine, near Boise, Mgr. Anderson early next week will celebrate the completion of the big siphon, in presence of invited guests, by uniting the line with an eleven-ounce gold rivet. Caswell Bros. have brought to Warren ten pounds of gold, which they took out of a porphyry formation at Thunder mountain in seventeen days.

At Halley the Tyrannis mine has shipped five carloads of ore this season. The mill makes two to three tons of concentrates a day. The crosscut on the 300 level of the Golden Star mine has cut the vein and exposed 4 feet of good ore.

Linderman & Martin made a cleanup in their placer claim near Boise amounting to \$1200 from a hole 30 feet square.

Statesman: The Ironsides mine near Boise shipped 1200 tons of ore, giving a gross return of \$43,000. In addition to this 1800 tons have been treated in Boise, the average assay value of which was \$30 a ton. There are 2000 tons of ore on the dump that will average \$20 a ton. Over 200 assays from the Ironsides, taken from all parts of the mine, the good ore with the bad, gave an average of \$30 a ton. The company has been confining its operations for some time to development, and a good property is being opened up. The Ironsides ledge is large and the paystreak averages 2 1/2 to 7 feet in width. The property is owned by the Ironsides G. M. & M. Co., of which Mrs. H. Adams of Boise is president. The Trade Dollar mine at Silver City is said to have paid \$500,000 dividends the past year. The output has been heavy and the ore has yielded good returns.

Avantech: The Empire mine at Silver City, bonded to Senator Pettigrew and others, is being opened for examination. The mine was unwatered to the sixth level two weeks ago and samples taken. The assays were of such a nature that the prospective purchasers have ordered the mine unwatered to the bottom, and will also do some drifting in the eighth level before securing further and final reports. The property is said to show favorably and the assays ran higher than expected. The test run of 300 tons of Poorman ore has been completed and has proved satisfactory to the management. The process used was electro-cyanide. The ore is free milling, over 60 per cent of the gold being caught before reaching the vat. It is probable that the Poorman Co. will equip its mill with amalgamating machinery as soon as the developments of the mine call for continuous milling facilities. At the Black Jack the shaft is down 250 feet and the crosscuts have tapped two ledges. The mill is working steadily on good ore and the output is large. Over eighty men are employed.

MONTANA.

Near Big Timber, P. Nelson began work on a coal mine last year and furnished some coal to the citizens of Big Timber. The vein was about 2 feet thick. Since then he has cross-sectioned the main tunnel in two places and cut a vein about 7 feet thick.

The Liverpool mine at Clancy has passed the 500-foot mark. It is the intention to sink to 600 feet. The ore continues strong and the quality good. In reopening the Moulton mine, at Rock Creek, 1400 gallons of water are hoisted every sixty-five seconds in tanks, each tank holding 700 gallons, requiring sixty-five seconds for a round trip, one being lowered and filled while the other is hoisted. It is expected to take three weeks to unwater the mine, after which thirty men will be employed.

The Bimetallic mill at Philipsburg has been running fifty stamps since June, and last week twenty additional stamps began to drop. There are now about 300 men at work at the mines and in the mill.

Butte Miner: The Washoe Co., at Butte, is said to have a bond on the Arctic lead, which is owned mainly by Connell & Murray. A shaft is to go down 500 feet by the terms of the bond, and the price to be paid in case it is taken up is \$250,000. The Arctic lead, which extends along in part between Granite and Quartz streets, was located on top of the original townsite, and the surface rights were sold reasonably, so that no contest was made,

though there was some doubt about the validity of the claim to the surface ground. The transaction has not been made direct to the Washoe Co., but it is stated on good authority that the third party is acting for the Daly-Haggin corporation. The Parrot Co. is sinking a three-compartment shaft on the Bellona claim, adjoining the Moonlight, of the Washoe Co. The shaft is going down on what is known as the Moonlight vein, and is over 300 feet deep. The Parrot Co. is still developing the Little Minah, with good indications of making a producer of it.

SOUTH DAKOTA.

Near Lead, A. Glower is working a property that produces iron and copper, from which twenty tons a day are shipped to the smelter. The ore carries enough iron and copper to make it of value as a flux, for which \$2.50 a ton and the freight is paid. The ore carries an average of \$2 in gold, which is saved at the smelter, and a small per cent of silver.

Pioneer Times: The D. & D. smelter at Deadwood is running two furnaces, handling the ore from the mines of the company and from the Buxton at Terry and the American Express in Blacktail gulch. No other custom ore is received until the building has been finished. The Detroit & Deadwood Co., purchaser of P. H. Smith's claims at Two Bit, has three shifts at work and sinking is progressing rapidly. The Garden City chlorination plant has been leased to Alexander & Dotson, who are converting it into a cyanide plant. The lease is for one year.

WYOMING.

The Doane mine, at Battle Lake, is a chimney of copper ore with a shaft 175 feet deep. It has several hundred tons of ore on the dump giving from 15 to 20 per cent copper and \$4 in gold.

ONTARIO.

The Hidden Treasure mine at Sturgeon Falls has been sold by the Gehl Bros. and a cash payment made of \$10,000. The Emperor mine is employing twenty-five men and has a good ore body. The shaft in the Golden Star at Mine Center has reached 300 feet and is in fair grade ore.

NEW MEXICO.

A streak of ore running 100 ounces of silver and between 60 and 75 per cent lead has been uncovered by Kresge & MacKley near Hanover. J. & P. Welsh have made a strike of copper-iron at Hanover that runs high in copper. The placer grounds near White Oaks are estimated to cover about 4000 acres and the pay dirt will run on an average about 12 feet in depth. The difficulty heretofore experienced in that locality has been lack of water, which has been remedied. Water in sufficient quantity to handle 2000 cubic yards of dirt per day has been secured twenty miles away at the Capitan mountains, the discharge being 500 gallons per minute.

The Cochiti G. M. Co. at Bland is finishing a complete reduction plant. The plant has a daily capacity of 125 tons, which can be increased to 200 if necessary. About 500 men are at present employed in the mines and mills. The crushers have already been started and the whole plant will be in full operation this week.

COLORADO.

In the special correspondence from Cripple Creek in the issue of July 30th, a misprint credited the group comprising the Christinas, Longfellow, Pinto, Specimen, Free Coinage, Shurtleff, Garfield-Grouse, Favorite, Pharmacist, Burns and Mountain Beauty with a monthly production from each property named of 2500 tons. That amount represents the aggregate and not the individual yield of the group of mines specified.

BOULDER COUNTY.

The Galvin group, at Quigleyville, is making a good showing. On one claim the vein is 20 feet wide and on another it is 10 feet and gives good returns. H. H. Green bought the White Crow dump of several thousand tons and will experiment on it with his new method of treatment.

CHAFFEE COUNTY.

Near Whitehorn, the Golden Eagle vein has been opened about every 100 feet for the full length of the claim, and it carries solid ore that varies in width from 1 to 3 feet and assays from \$50 up. A quantity of ore has been sacked for shipment.

GLENN CREEK COUNTY.

At Georgetown the Griffith mine shipped ninety tons of ore, producing gold and lead, which is a distinctive feature of the property.

EL PASO COUNTY.

The Half Moon mine in the Carl Johnson lease at Cripple Creek has a vein 30 feet wide, which runs \$25 a ton without sorting. It is the largest body of ore reported in the district. The latest strike in the Elkhorn was made in the fifth level, in the old Elkhorn chute. The ore runs from \$37 to \$940 per ton. It is believed to be longer than where it was opened on the 300-foot level. There are 5 feet of ore filling the drift. The output is 1500 tons per month of a good grade.

The Barnard creek section of Cripple Creek is being thoroughly prospected. One prospect has sent to the mills three wagon loads of ore that netted \$25 per load. The entire shipment was about six tons and the result will be an increased amount of development in the district. So far most of the work has been confined to prospecting. The ore chute in the Garfield Consolidated is 400 feet long, making a good body of average grade, carrying a 4-inch pay streak of high grade that shipped \$10,000. The deepest workings are only 300 feet, but it has shipped \$250,000 worth of ore. The lessees are driving ahead on the repairs and improvements night and day.

FREMONT COUNTY.

At Barehills the Galveston M. & D. Co., E. M. Lamont Gen. Mgr., has a large number of claims, one of which—the Warren—has a shaft

down 300 feet and has a 16-inch contact vein of chalcedony formation in agate and jasper quartz that gives a working value so far as tested of \$24.80 to the ton. Work on the Mayflower is progressing. The depth reached is 300 feet, and as soon as the road can be completed a steam hoist of large size will be put on the property. Their mill tests give values of \$65 in gold, silver and copper.

GILPIN COUNTY.

The Geiger mine near Central City has had pay ore from the surface, and at 100 feet depth has 5 feet of \$40 sulphides which at 150 feet has opened into a chamber of high grade ore.

The shipments of smelting ore and concentrates to the smelter for July foots up 227 cars.

Post: The Gunnell property in the Eureka mining district has a daily output of from thirty-five to fifty tons, mostly of a milling character. Many of the mines in this county are being worked on the leasing system by local pools, and some are producing splendidly. Pools are formed consisting of business and mining men to start up work anew on old and abandoned property, and this system of joint operations is becoming popular and is doing good for the county. The July shipments of ore from this county were 279 cars.

GUNNISON COUNTY.

Denver Post: At no time since 1893 has Crested Butte experienced such activity in mining as it has this summer. Many properties that have been neglected have been taken hold of by enterprising mining men and resolved into paying properties, which will result in the tonnage from this district exceeding any year since the decline in the price of silver. The Sylvanite, a mine that has produced over \$2,000,000, is yielding ore that runs 1200 ounces in silver, and is shipping regularly. The Augusta, another former producer, has commenced shipping good ore which carries a high percentage of lead.

HINSDALE COUNTY.

At Lake City a strike has been made in the Bob Ingersoll mine of tellurium that runs 8.20 ounces gold and 962.66 ounces silver per ton. The pay streak is 2 feet 6 inches wide. Two new companies have started work at Burrows Park and several smaller enterprises are opening up in the higher lands. The St. Jacobs and the George III have been heavy producers of high-grade gold and silver ore in the past, and their resuming work will give an impetus to mining in this district.

LAKE COUNTY.

In five properties in the Twin Lakes mining district 800 feet of work has been done and large bodies of \$15 ore opened. During the development one lead was cut that carried \$200 in gold and sixty ounces of silver. Shipments will commence as soon as the amount of development laid out is completed. The Iron mine of Leadville is being worked by a lessee, who is employing thirty-five men. The ore carries six ounces silver and 55 per cent iron excess, which makes it a good shipping ore. They are also shipping to the smelters a fair grade of lead sulphides and carbonates. From the first 25 feet sunk on the Ruby claim, Red Mountain district, thirty tons of smelting ore shipped netted \$460 per ton. Seven men are sinking the shaft and running a crosscut tunnel which in 30 feet more will catch the vein at 110 feet surface depth. The vein is 180 feet wide.

The Bull Hill group on Mt. Elbert is opened by over 1000 feet of shafts, tunnel and drift. One shaft at 100 feet shows 3 feet of ore which assays \$42 per ton.

News Reporter: J. R. Curley, Supt. Iron silver mine at Leadville, says he is hoisting as much water every day as the down-town mines will be required to hoist and that he is lowering the water an inch an hour. He expects to put men at work in the mine in a week; and, as he is pumping water for the Louisville, Ruby and other mines in that district, they will probably be able to start operations about the same time. It is understood that the Pumping Association has assessed itself \$40,000. This will increase the fund to about \$90,000. There seem to be no obstacles in the way of pumping now, and the probabilities are that it will begin at once.

The Silver Standard M. Co. has made a five-year lease of its ground in Iowa gulch to Milwaukee capitalists, and it is understood that operations will commence in a short time. The Silver Standard group consists of six claims—the Leadville, Silver Standard, Henry M. Teller, Free Coinage, Wolcott and Detroit—the total area of the group being about sixty acres.

OURAY COUNTY.

A body of milling ore varying from 8 to 28 feet in width is encountered in the Silver Ledge mine, Ouray, from which forty tons per day is taken to the mill. Forty-five men are working in the mine and mill. In the 355-foot level a streak of tellurium was struck and a carload shipped to the smelter.

The Fowler smelter, Ouray, is running night and day, employing thirty-two men and turning out 100 tons of ore a day.

SAN JUAN COUNTY.

The Bonne Homme property near Burrows Park has shipped ten cars of sorted ore this season and before the season ends there will be that many more shipped. There is enough ore in sight at present to warrant the management to put in a concentrator.

Seven tons of cobblings from the ore of the Robert Bonner at Silverton were milled and plated over seven ounces gold per ton, besides seven sacks of concentrates, which sampled seventy-six ounces silver and two and one-half ounces gold.

SAN MIGUEL COUNTY.

Twenty-five cars of ore have been shipped from the San Bernardo mine at San Bernardo this year. The product runs principally in silver and lead, some cars sent to the smelters

yielding \$1800 per car. It is worked entirely by leasers and is owned in London. The Gipsy Queen, which has been idle for years, has passed into the hands of lessees, who have had thorough tests made of the ore which was found to be high-grade silver with fair values in gold.

ARIZONA.

Senator Dorsey, en route from San Francisco to New York, reports the sale of the Harris group of gold mines in the Harqua Hala district to the Del Monte M. Co., who will at once erect extensive machinery and operate the mines on a large scale.

Work on the Diamond S. mine at Crown King is progressing. Several shipments have been made of high-grade ore, the smelter receipts showing 1600 ounces silver and considerable gold. J. W. Searles is developing the property.

The plant of the Mammoth G. M. Co. at Mammoth is in operation on 200 tons of tailings. There are twenty men employed in the work. Fifty stamps are dropping on ore and prosperity is manifest. The payroll of the Copper Queen Co. at Bisbee is above the 1150 mark, including store and railway forces.

The Cochise Copper Co., which has thirteen claims in Dubecker canyon, will do some active work before October. The Bessemer, Alta and Atlas mining claims in Castle Creek district have been deeded to the Bessemer Copper Co. by J. W. Norton. E. E. Greenwood worked twenty-two tons of ore recently from the Sunrise at Placitas, from which the returns were seventy-nine ounces in gold, or an average of \$50 per ton. A bar of bullion was brought to the bank at Tucson last week by the Mammoth M. Co. valued at \$8000.

The bridge across the Gila river is finished, and there now remain but thirty miles of road to be built to Globe City. The Old Dominion mine is expected to be producing copper by Nov. 1st, and some think it should produce 8,000,000 pounds of copper the first year.

In the Big Bug district the old Trilite mine was sold for \$5000 cash; Comer & Sons sold a mine to a Philadelphia company for \$15,000, and the Shelton group is sold to a Denver company for \$40,000.

The Franco-American mines near Tucson are showing a large body of high-grade shipping ore of sulphide carrying copper, gold, silver and lead. The development of the Louise of the same company has a strong vein of sulphides. There are about 3000 or 4000 tons of fine grade ore on the dumps which will not stand transportation as far as Tucson, and which will mill a very handsome profit, which means that the company will erect a mill very soon. The president is Karl Miller.

The Tres Amigos mines of Oro Blanco were sold to Peoria, Illinois, people for \$50,000, of which a good part was cash. The group comprises three claims, the Tres Amigos, Caniada and San Juan. The properties are gold and are promising. An average taken from nine different workings gave a return of \$41.20 gold. All of the ore will run \$9 to \$39 per ton. There has been 500 feet of development at the mine. A mill will be erected at once and the mines incorporated. A large force will be put to work. A. P. Essen is the Supt.

Progress is satisfactory at the Table Mountain, Pima county, copper camp. There are about 150,000 tons of ore on the dump, including 20,000 tons of high-grade. A large stamp mill for the reduction of gold ore will be erected shortly. The Azurite Co., operating in Pima county, has purchased the Apache smelting plant, which will be moved to the company's ground, where the dump holds about 4000 tons of high-grade ore. Work on the Planet-Saturn mines in Pinal's gulch, Yavapai county, which was suspended on account of the flooding of the mines, will soon be resumed. Supt. Clark has started pumping. The ore from the Grand Prize mine, in Green Valley district, Gila county, which has been shipped in concentrates, will hereafter be reduced to matte. J. C. Underwood and J. R. Grant bonded the Hidden Treasure mine on Lynx creek in Yavapai county. There is considerable prospecting going on near Bisbee and some fair ore has been found in that locality. The C. W. M. & M. Co. of Pearce ship about two cars of ore per day. They have ordered a 20-stamp mill, which will be put in as soon as possible.

Mineral Wealth: Some time this month Temple bar will have the water turned on it with great force. Mohave county expects great things from the working of these mammoth bars, and when the machinery is all in place and at work and the gold coming out the people will realize what a big thing it is. Machinery for months past has been going to Temple bar and being put in place, but placer or hydraulic mining has been a new thing in Mohave county. In addition to the advance in quartz mining in the county the success of these hydraulics will add largely to the gold output of that section.

SIBERIA.

F. W. Beasley of Miles City, Mont., and Louis Spitchet of San Francisco have returned from prospecting along the Siberian coast. They were within 100 miles of the convict mine settlement, where they met a Russian commissioner, who warned them to leave the country under the penalty of imprisonment. The officer told them the laws strictly prohibited prospecting on Russian soil. Six men, four Englishmen and two Americans, who persisted in violating the law in 1896 were arrested and sentenced to a term of imprisonment in the Siberian mines. The commissioner, explaining the manner of working the Siberian mines, said that shafts 60 or 70 feet were sunk to bedrock and the pay streak was followed by drifting. Instead of burning the frozen ground, as in the Klondike, the ground is loosened with powder and pick. One shaft has followed the pay streak down the bed of an old river to a depth of 700 feet below the surface. Most of the claims, he added, paid from 18 to 20 roubles to the man. Between 7000 and 8000 convicts are employed in the mines.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Deway, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING AUGUST 2, 1898.
 608,548.—DRILL—Columbus & Hesseltine, Creston, Wash.
 608,327.—DRESS FORM—Augusta B. Friel, Los Angeles, Cal.
 608,425.—PRESERVING FRUIT JUICES—C. Graf, Bannock, Cal.
 608,350.—KITCHEN CABINET—J. L. Heustis, Stockton, Cal.
 608,365.—VEGETABLE SLICER—C. B. Lawson, Stockton, Cal.
 608,465.—GATE—M. K. Lewis, Albany, Or.
 608,337.—BREAD CUTTER—W. Merkle, Oakland, Cal.
 608,393.—PIPE BENDING MACHINE—Parker & Gross, S. F.
 608,217.—RELIEF VALVE—J. C. Parker, S. F.
 608,218.—STEAM GENERATOR—J. C. Parker, S. F.
 608,477.—WRENCH—R. R. Parrish, Independence, Or.

 608,434.—BOXING GLOVE—W. G. Wood, S. F.
 2,162.—DESIGN—E. P. Buren, Santa Ana, Cal.
 NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Deway, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Deway, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

BREAD CUTTING KNIFE.—Wm Merkle, Oakland, Cal. No. 608,337. Dated Aug. 2, 1898. This invention has for its object an improved device for cutting bread, cake and like articles. It consists essentially of a plurality of knives with a transverse extension bar and means for adjusting the knives with relation to each other in said bar and also for setting them at any desired angle with relation to the holding bar and locking them in position thereto. This extension bar has a handle which enables the operator to use all the knives at one time, thus enabling him to make either a vertical or diagonal cut and slice the bread or cake into as many pieces as may be desired at a single movement.

CONVERTIBLE GARMENT AND TENT.—F. Terramorse, San Francisco, Cal. No. 608,351. Dated Aug. 2, 1898. This invention relates to a device which is especially designed for the protection of soldiers, travelers and others who are liable to be exposed to the elements during the day or night. The object of the invention is to provide an article of wearing apparel which may be employed as a cloak and hood during the day, and it is so constructed that it may be spread out and set up as a shelter tent to equally protect the user from the elements at night. It is so formed that it is easily rolled into small compass for transportation when not in use. The body portion is approximately rectangular and has triangular projecting end flaps and a central opening. This opening has a hood or head-piece connected with it and a flap adapted to hang upon the back when used as a garment and to fold over and cover the opening and head-piece when it is employed as a tent. The rectangular portion may be set up by the use of supporting sticks at the ends, and the triangular end pieces will fold inwardly at each end so as to form a closure for the tent.

BICYCLES.—Charles E. Stockford, Sulphur Creek, Cal. No. 608,350. Dated Aug. 2, 1898. This invention relates to improvements in bicycles. The main frame and the wheels of the bicycle are essentially similar to those in ordinary use. The propelling device consists of a clutch mechanism fixed to the sprocket wheel shaft and arms extend from the clutch casings and are provided with sockets into which other arms are adjustably secured so as to lengthen or shorten the levers by which the clutches are actuated. The outer ends of these levers are connected by links with bars which extend upwardly at the front of the machine and have handles which are grasped by the rider. These parallel bars are fulcrumed to the lower front bar of the frame so that the handles may be oscillated backward and forward and the machine thus propelled. Upon each side of the front fork are foot pieces or pedals upon which the rider may place his feet and by turning the fork in one direction or the other the machine is readily steered.

THE ROESSLER & HASSLACHER CHEMICAL CO.
 100 William Street, New York.

CYANIDE

- Peroxide of Sodium
- Hyposulphite of Soda
- Chloride of Lime
- Sulphide of Iron

And Trade Chemicals for Mining Purposes.

MICHIGAN COLLEGE OF MINES.

Supported by the State of Michigan. Practical work. Elective system. Special advantages for men of age and experience. For catalogue address DR. M. E. WADSWORTH, President, Houghton, Michigan.

COPPER MINE.—One-half interest in a rich copper mine carrying gold and silver and now producing considerable ore, is offered for sufficient capital to pay for necessary developments. For further information call or address MINER, 1022 Mission Street, San Francisco, Cal.

WANTED.

Partner in Extensive Placer and Quartz Mines. Free wood and water. JAMES ARTHUR, Cornucopia, Union Co., Oregon.

Wanted by Sept. 1st an Experienced Assayer and Retort Man.

Daily assays and mine books to keep for ten-stamp mill, one day from San Francisco. Pay \$75 per month. Address, with references and experience, R. A. B., care this office.

Experienced Chemist, Assayer and Cyanide Operator

DESIRES ENGAGEMENT.

Has had charge of cyanide plant where segregated slime and silty material have been worked to high percentage of gold value at small cost. References. Address P. K., this office.

WANTED.

METALLURGIST and PRACTICAL SMELTER

Will be open for engagement October 1st as superintendent of Copper or Lead Smelting Works.

Thoroughly competent in analyzing assaying, and handling men. Speaks Spanish. Excellent references. Address SMELTER, care Mining and Scientific Press.

Bargain, for Sale.

New Complete Mine Machinery Outfit, Including No. 3 Merrill Mill, Rock Breaker, Ore Feeder, Etc.

E. A. HJLMAN, 906 Broadway, Oakland, Cal.

FOR SALE.

1 Rock Breaker,
 1 5-foot Huntington Mill,
 3 Duocan Concentrators,
 35 H. P. Roller and Engine,
 Shafting, Pulleys and Belting.
 Machinery but little used. Will sell for one-half San Francisco costs on board cars at Halley. Address L. C. BAILEY, Halley, Idaho.

MINE FOR SALE OR BOND.

TUOLUMNE COUNTY, EASTERN BELT.

HIGH GRADE.

PARTIALLY DEVELOPED.

Apply MINE OWNER.

Care Mining and Scientific Press, 330 Market St., San Francisco, Cal.

Extraordinary Opportunity.

WANTED, CAPITAL

To assist owner in developing three gold-copper and one silver-lead mine of extraordinary richness, assays running as high as \$800 in value to the ton. These mines are located in a rich, well-known mineral belt, with large quantities of ore in sight. Will bond, or sell outright, or make any satisfactory arrangement. Full particulars given upon request. Capitalists and investors would do well to investigate. Address

WILLIAM CROSBIE,

Revelstoke, British Columbia, Canada.

The DAISY FLY KILLER, 20c.

The best fly killer known. It is a beauty, neat, clean and attractive—in decorated metal. Will not injure or soil anything. Will attract and effectually kill all the flies in a room. Harmless to persons. Write for one; sent postpaid.

for 20c. by the manufacturers, SOMERS BROS., 3d Ave. and 3d St., Brooklyn, N. Y.

IT WILL LAST ALL THE SEASON.

PROSPECTING BATTERY.

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.

THIS : :

Two-Stamp Self-Contained Battery

IS DESIGNED BY

THE UNION IRON WORKS

Expressly for Prospecting Work.

It was awarded First Prize at the recent Mechanics' and Manufacturers' Fair, where it was in daily operation, crushing ores from various mines throughout the State.

Weight of stamps, 275 pounds each; capacity of battery, determined by actual work, 200 pounds per hour, through a No. 7 slot-punched screen.

Entire battery weighs about 3000 pounds; heaviest piece, mortar, weighing 1200 pounds.

Can be taken apart and transported to any locality.

THE COLORADO IRON WORKS CO., DENVER, COLO.

Established 1860.

ENGINEERS AND MANUFACTURERS OF

Ore Milling and Smelting Equipments.

We beg to call attention to our

High Speed Special Rolls

as being the most efficient and the most economical machine for fine dry crushing ever placed upon the market. The rolls having

NARROW FACES and
LARGE DIAMETERS

can be fed evenly over the whole width of faces with certainty, and hence the faces or crushing surfaces are easily kept true. Descriptive pamphlet on application.

HIGH SPEED SPECIAL ROLLS, WITHOUT HOUSING.

Double rope tramways are acknowledged to be superior to those of the single rope type, and any one contemplating the erection of a tramway should investigate the merits of the . . .

THE ONLY
AUTOMATIC
TRAMWAY
BUILT.

FINLAYSON PATENT AUTOMATIC WIRE ROPE TRAMWAY.

In this system the cost of transportation is brought below any figure heretofore reached. Its tonnage capacity is unsurpassed. Further information on application.

Modern Methods

As Applied to the Handling of Freight, Grain, Ores, Raw and Manufactured Products.

MALLEABLE IRON BUCKETS, Approved Pattern and Weight; ROPE POWER TRANSMISSIONS, SHAFTING, PULLEYS, GEARING, CLUTCHES, Etc.; ELECTRIC COAL MINING MACHINERY.

KEYSTONE DRILLER CO., Beaver Falls, Pa.

REMEMBER! THE STATE FAIR

WILL BE HELD AT **SACRAMENTO,**

SEPTEMBER 5th TO 17th, 1898.

This Annual Exhibition Covers a Broad Field and Brings Together People That Have Many Interests.

THE INDUSTRIAL DISPLAY

Made each year in the commodious Pavilion embraces a most general assortment of the artisan's work.

NEW DEVICES IN MINING

Machinery can be shown here to an advantage, as the extensive mining region contiguous to Sacramento makes it easy of access for those interested in this character of exhibits.

PRACTICAL PUMPING PLANTS

Are needed in many sections of the State, and those interested are viewers of these displays.

MODERN MECHANISM

Of every character is placed on exhibition at the State Fair in order to take advantage of the great crowds drawn hither by the various attractions.

THE AGRICULTURIST and general farmer makes it a point to examine, not only the improved breeds of Live Stock that form an important feature of the Fair, but all improvements in machinery and labor-saving appliances.

THE MERCHANTS of the interior of the State, the genuine distributor of wares of every description, attends the State Fair, to note the progress in all lines of trade.

THE MANUFACTURERS and their representatives cannot afford to ignore the Annual State Fair as a medium to advertise their output of goods and wares.

REMEMBER THE DATES.

Exhibits Carried free by the Southern Pacific Railroad Co.

EXCURSION RATES ON ALL RAILROADS.

EDWIN F. SMITH, Secretary.

WRITE THE SECRETARY FOR PREMIUM LISTS.

JOSHUA HENDY MACHINE WORKS,

Principal Office: NO. 42 FREMONT STREET. - - - Works: Corners Bay, Kearny and Francisco Streets, SAN FRANCISCO, CAL.

SPECIAL DEPARTMENT OF

Hydraulic Mining Machinery,

Comprising Hydraulic Gravel Elevators, Double-Jointed Ball-Bearing and Single-Jointed Giants, Sheet-Iron and Steel Water Pipe and Fittings, Water Gates, Etc.

NOTICE.—All other forms of Hydraulic Gravel Elevators are simply poor imitations in construction and infringements of the patents held by us. The Double-Jointed Ball-Bearing Giants recently perfected and patented by our Mr. JOHN H. HENDY are incontestably superior to any other form of Giants yet introduced.

We are prepared to furnish plans and estimates of cost of any proposed Hydraulic Mining Plants upon any specifications submitted to us, and tender the services of our Hydraulic Mining Engineer to erect and place same in successful operation under guarantee.

WHITE, ROGERS & CO.,

Consulting Engineers and
Millwrights,

OFFICE, 306 PINE STREET, - - SAN FRANCISCO, CAL.

Sole Pacific Coast Agents and Builders of the Celebrated

WILFLEY CONCENTRATOR.

The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675.
Infringements will be prosecuted to the full extent of the law.

PRICE, \$450, F. O. B., San Francisco.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in
Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

— SEND FOR CIRCULARS. —

These Machines are Kept in Stock Ready for Immediate Shipment.

MINE BELL SIGNALS.

Adopted, Used and in Force in Accord-
ance with State Law.

For the convenience of our readers in the
mining counties we print in legal size, 12x36 inches, the Mine Bell Signals and Rules provided for

in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled
"An Act to Establish a Uniform System of Bell Signals to Be Used in All Mines Operated in the
State of California, for the Protection of Miners." We furnish these Signals and Rules, printed on
cloth so as to withstand dampness. 50 Cents a Copy.

**Kendall's Patent
Quartz Mills.**

Having renewed our contract on more advantageous
terms with Mr. S. Kendall for the manufacture of his
Patent Quartz Mill, we are enabled to offer these
mills at Greatly Reduced Prices. Having made
and sold these mills for the past 16 years, we know
their merits, and know that they have given perfect
satisfaction to purchasers, as numbers of commenda-
tory testimonials prove. We feel confident, therefore,
that at the prices we are now prepared to offer them,
there is placed within the reach of all a light, cheap
and durable mill that will do all that is claimed for
it and give entire satisfaction.

Market Reports.

The Markets.

SAN FRANCISCO, Aug. 11, 1898.

SILVER.—London, 27½d; New York, 59½; San Francisco, 59, nominal; Mexican Dollars, 46@46½c. A Washington special says: Information from London is to the effect that the Indian mints are to be reopened to free coinage, and the assertion is made that this will occur at an unexpectedly early date. The report of the Indian commission is to be published before September 1st, and this is expected to throw some light upon the details of the matter. The announcement that the important step of reopening the mints will take place comes from a source which is usually reliable. An effort to have the ratio changed from 16 to 1 to 22 to 1 is also hinted at.

COPPER.—Lake, strong at 11.75.
LEAD.—New York reports "very firm, 4 bid, 4.05 asked;" smelters quote 3.85; local, pipe, 6@6¼c; sheet, 6½@7c; pig, 5½c; bar, 6c.

IRON.—American, soft, \$20 and \$22 per ton; Scotch, \$23.

SPELTER.—5¼ and 5½.
TIN.—Mento Roofing, redipped, \$7; English, to arrive, \$4.50; Pig, 18c.
ANTIMONY.—9½, 10.
BABBITT METAL.—10-12-14—best 16c.

NAILS.—List per keg: No. 20 to 60d, wire, \$2.25; cut, \$2.00; 10 to 20d, wire, \$2.30; cut, \$2.05; 8d, wire, \$2.35; cut, \$2.10; 6 and 7d, wire, \$2.45; cut, \$2.20; 4 and 5d, wire, \$2.55; cut, \$2.30; 3d, wire, \$2.70; cut, \$2.45; 2d, wire, \$2.95; cut, \$2.70. In carload lots, 10c per keg less. In Chicago wire nails have been advanced \$1 a ton, making the price \$1.35 per keg for carload lots. The rise is in consequence of the advance of \$2 a ton in the price of steel, which was attended with considerable excitement in the iron trade. "I look to see steel make further advances and I expect that wire nails will reach \$1.50 a keg," says one of the officials of the American Steel and Wire Co. "At this season of the year we usually close for repairs and we are unable to keep up with orders."

QUICKSILVER.—Domestic, quiet and unchanged, \$42.50@43; export and carload lots, special rates.

POWDER.—F. O. B., San Francisco: No. 1, 75% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1* 60%, carload lots, 13½c; less than one ton, 15½c. No. 1* 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2* 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2 per keg.

FUSE.—Triple tape, \$5.10 per 1000 feet; double tape, \$4.35; single tape, \$3.45; Hemp, \$3; Cement No. 2, \$4.35; Cement No. 1, \$3.45.
CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9.

COAL.—San Francisco coast, yard prices: Wellington, \$8.00; Coos Bay, \$5.00; Seattle, \$6.00; Southfield, \$7.50.

Cargo lots, Eastern and foreign:
Wallend, \$7.50; Cumberland, \$10.00; Brymbo, \$7.50; Cannel, \$9.50; Pennsylvania, hd., 14.50; Welsh Anthracite, 12.50; Scotch, 8.00; Rock Springs, \$7.60.

COKE.—Foreign, \$13; domestic, \$11 per ton.

CHEMICALS.—Cyanide of potassium, jobbing, 31 @ 31½c per lb.; carloads, 28c; sulphuric acid, 2½c per lb. for 60%; nitric acid, 15c; soda ash, \$1.60 per 100 lbs. 53%; hyposulphite of soda, 2½c per lb.; blue vitriol, 4½c per lb.; borax, refined, 5@6c per lb.; chlorate of potash, 9½@10c; roll sulphur, 2½c; blue vitriol, 4c.

LUMBER.—Retail: Pine, ordinary sizes, \$17@18.50; redwood, No. 1, \$18@20; No. 2, \$16@18.

Regarding imports of gold, by request is herewith presented in tabulated form the parities of gold bars and gold eagles at various prices in London. By calculating from these and taking into consideration the expenses of transportation of gold, it will be possible to arrive at a good idea of gold points. The first table gives the parity of gold bars at various prices from 77s 9d to 78s:

| London price per ounce standard. | Parity. |
|----------------------------------|---------|
| 77s 9 d | 4.8744 |
| 77s 10 d | 4.8891 |
| 77s 10½ d | 4.8967 |
| 77s 11 d | 4.9040 |
| 77s 11½ d | 4.9115 |
| 78s 6 d | 4.9587 |

In estimating the parities of eagles, an average weight of 5.369 dwts. per bag of \$5000 is assumed. A variation of 1 dwt. is equivalent

to 91.1000 of 1c per pound in the rate of exchange.

As long as money is not above 2%, it is safe to reckon the total expenses of bringing over gold at, roughly, ¾ of 1%, to recover everything. This is equivalent to about 1.80c per pound in the rate.

| London price per ounce. | Parity. |
|-------------------------|---------|
| 76s 3½ d | 4.882 |
| 76s 4 d | 4.880 |
| 76s 5 d | 4.874 |
| 76s 6 d | 4.868 |
| 76s 7 d | 4.863 |
| 76s 8 d | 4.858 |
| 76s 9 d | 4.854 |
| 76s 10 d | 4.850 |

Dealing with imports from France, a similar method may be adopted. The par of gold bars is 5.1714. Expenses, exclusive of premium, are about 2.10 centimes to the dollar, which would make the gold import point, supposing gold could be obtained at par, 5.1924. To this must be added the premium charged, whatever that premium is, and at present it is 3¼ per mille. This is equivalent to about 1.75 centimes per dollar, which would bring the rate up to 5.2099 or practically 5.21. In this way, by noting the changes in the premium, it will be easy to arrive roughly at the gold point premium.

Up to quite recently Spain seemed devoid of the ability to make war or capacity to make peace, but within the last ten days that humbled kingdom seems to show some understanding of the situation, and peace negotiations are now presumably well enough advanced to justify the statement that the war is over, something that will be satisfactory to general business, which was necessarily disturbed since the first mutterings last February, immediately after the sinking of the Maine.

Mining Share Market.

SAN FRANCISCO, August 11, 1898.

The week showed no improvement in volume of sales or prices. There is no market and no business. Following is to-day's transactions:

| | |
|---------------------------|-------------------------|
| 9:30 A. M. SESSION. | |
| 100 Caledonia.....16c | 100 Crown Point.....10c |
| 200 C. Cal. & Va.....30c | 200 Utah.....6c |
| 2:30 P. M. SESSION. | |
| 100 G. & C.....14c | 100 Challenge.....13c |
| 1160 C. Cal. & Va.....40c | 100 Occidental.....52c |
| 100 Potosi.....10c | |

The conference of the Comstock companies as a sort of ways and means committee regarding drainage and the resumption of deep mining will hold their first meeting to-morrow afternoon. Jas. G. Fair was probably as good a miner as was ever on the Comstock. Twenty years ago he said he had prospected Hale & Norcross, "and swept the walls with a broom," yet, afterwards Supt. Keating struck a body of ore within 5 feet of one of Fair's prospecting upraises, from which ore to the value of over \$4,000,000 was taken. No one is infallible, and the men who now scout the idea of unwatering the Comstock levels are particularly fallible.

In response to an inquiry from Secretary Taffe of the Best & Belcher Mining Co., Commissioner of Internal Revenue Scott to-day sent the following decision concerning the transfers of stocks: "The issue in the same name of two or more certificates of stock in place of and for the same shares contained in a single preceding certificate of stock does not require stamps upon the certificate so issued. Issues of certificates of stock in other names without sale, of which he makes mention, are not understood. The presumption would be of sale of some transfer of interest and a stamped memorandum of sale or transfer should be required, or else the certificate must be stamped. So, in cases of certificates of stock carried in the names of brokers, which the holders wish re-issued in their own names in order to vote at an election held by the corporation, unless the certificates are accompanied by properly stamped memoranda of sale in the name of the holder the new certificates issued should be stamped. Where a portion of the shares contained in a certificate of stock are sold, the other remaining in the vendor, and new certificates are issued, the certificate for the stock sold or a proper memorandum of sale must be stamped, but the new certificate issued for the remaining shares which were not sold will not require a stamp. Such new certificates of remaining shares cannot, however, be issued in any other names without payment of tax."

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from Sara E. Reamer, in the Pemberton Gravel Mine near Forest Hill, Placer Co., to deposit tailings in Baltimore and Dardanelles canyons, and from Penrose & Barker, in the Bull Run Mine near Relief Hill, Nevada Co., to deposit tailings in a ravine below the mine, gives notice that a meeting will be held at room 59, Flood Building, San Francisco, Cal., on August 22, 1898, at 1:30 P. M.

Placer Miners' Attention

Is called to the fact that we are purchasers of

OSM-IRIDIUM

In lots of one ounce and upwards.

SELBY SMELTING & LEAD CO., 416 Montgomery Street, San Francisco.

FRESNO, June 25, 1898.

Hercules Gas Engine Works,
San Francisco, Cal.

DEAR SIRS:—

The fifteen-horse power gaso-
line engine and hoist purchased
from you is doing fine work
and is perfectly satisfactory in
every respect.

Yours truly,

TUOLUMNE MOTHER LODE
M. & D. CO.,

Per N. W. Moodey, Pres.

We have two large books full of testimonials; they speak better for the HERCULES than we can. Our works are the largest in the country. We have built and sold over 3500 engines; they are the standard everywhere. Any size up to 200 H. P. Stationary, Hoisting and Marine.

Assessment Notices.

MARINA MARISCANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 14th day of July, 1898, an assessment (No. 14) of 2 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of August, 1898, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 7th day of September, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
Office—217 Sacramento street, San Francisco, California.
CHARLES H. VANCE, Secretary.

ROSE CREEK MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 27th day of July, 1898, an assessment (No. 2) of five cents (5c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, room 163, Crocker building, Post and Montgomery streets, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 31st day of September, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 26th day of September, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
J. M. WILLIAMS, Secretary.
Office—Room 163, Crocker building, Post and Montgomery streets, San Francisco, California.

BOULDER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 27th day of July, 1898, an assessment (No. 1) of five cents (5c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, room 163, Crocker building, Post and Montgomery streets, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 31st day of September, 1898, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 26th day of September, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
J. M. WILLIAMS, Secretary.
Office—Room 163, Crocker building, Post and Montgomery streets, San Francisco, California.

WEST SANTA ROSALIA GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, State of California, Mexico.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 3rd day of August, 1898, an assessment (No. 1) of three (3) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, No. 310 Pine street, Rooms 15 and 17, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of September, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 26th day of September, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
J. W. PEW, Secretary.
Office—No. 310 Pine street, Rooms 15 and 17, San Francisco, California.

LEON GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, near Winchester, Riverside County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 16th day of May, 1898, an assessment (No. 1) of 1 cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, room 7, fifth floor, Mills building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of June, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 25th day of July, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
R. L. CHENEY, Secretary.
Office—Room 7, fifth floor, Mills building, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors of the Leon Gold Mining Co., the day of delinquency of the above assessment is postponed to July 9th, 1898, and the day of sale to MONDAY, August 8th, 1898.

Office—Room 7, fifth floor, Mills building, San Francisco, California.
R. L. CHENEY, Secretary.

POSTPONEMENT.

By order of the Board of Directors of the Leon Gold Mining Co., the day of delinquency of the above assessment has been postponed to August 6th, 1898, and the day of sale to MONDAY, September 5th, 1898.

Office—Room 508, Safe Deposit building, Cor. California and Montgomery streets, San Francisco, Cal.

POSTPONEMENT.

By order of the Board of Directors of the Leon Gold Mining Co., the day of delinquency of the above assessment has been postponed to September 3rd, 1898, and the day of sale to MONDAY, October 5th, 1898.

Office—Room 508, Safe Deposit building, Cor. California and Montgomery streets, San Francisco, Cal.

JUNCTION MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 6th day of August, 1898, an assessment (No. 20) of three (3) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 106 Leidesdorff street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of September, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 31st day of October, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

M. of said day, to pay said delinquent assessment thereon, together with the costs of advertising and expenses of sale.

F. METTMANN, Secretary.
Office—No. 237 Twelfth street, San Francisco, California.

Lunkenheimer's "Clip" Gate Valve.

Single Disc
DOUBLE SEATED.
Made with Screw Ends
from 1/2 in. to 3 in. sizes.

BEST IN QUALITY.
LOWEST IN PRICE.
THE ENGINEERS' FAVORITE.

These Valves are made of cast iron and all wearing parts of gun metal. They are superior to the common cheap brass valves with which the market is flooded.

WHY?

BECAUSE they possess all the advantages of a cast iron pipe fitting. Elbow, Tee, Coupling, Union, etc., namely—are heavy and rigid—not injured by expansion and contraction or rough handling in pipe fitting. TAKE PRESSURE FROM EITHER END—Body and hub are held together by a steel clip, consequently always easily taken apart. Joint between body and hub made permanent by an imbedded seamless oval copper wire washer. If you desire the BEST, STRONGEST and MOST DURABLE valve for general purposes on all ordinary pressures, use this valve. IT IS A STANDARD FITTING OF NEAT APPEARANCE and FULLY WARRANTED TO SATISFY. Made also in All Iron for Cylindrical Plants. Try them and be convinced. Specify them and order through your dealer. Our Catalogue of superior Steam Specialties FREE for the asking.

Effect a Saving in Friction Losses. No Trouble to Install. No Alterations of Mill Necessary. No Keys or Wedges to Adjust.

Manufactured only by GLOBE IRON WORKS, STOCKTON, CAL., U. S. A.

Manufacturers of All Classes of Mining Machinery. Estimates Furnished.
Office of WILDMAN GOLD MINING COMPANY, SUTTER CREEK, CAL., June 28, 1898.
Globe Iron Works, Denver, Mass. and Conning Street, Stockton, Cal.—GENTLEMEN: Replying to your inquiry about the Globe Patent Battery Stem Guides furnished us by you last fall, will say that you supplied us with Guides enough for ten stamps of the Wildman Mill. These Guides have been in constant use for the past eight months, and so far do not show any wear either on the Guides or the Stems. They are more convenient than any Guide I ever handled, and much time is saved with them in changing stems, etc. The Guide can be set so close you always get a fair blow on your dies, and the use of these Guides materially increases the crushing capacity of your batteries. It is our intention to replace all of our Guides with those of your make, and I cheerfully recommend them to anyone desiring a good, serviceable and economical Guide. Very truly yours,
JOHN ROSS, JR., Superintendent.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY, STRONG & Co., Patent Agents, 330 Market St., San Francisco, Cal.

CHICAGO EDISON COMPANY, 139 Adams Street, CHICAGO, ILL.

FOUR and SIX-FOOT FRUE VANNERS

With Brownell "Patent Lip" Flange Belts.

STANDARD MACHINE OF THE WORLD.

When a Concentrator like the Frue Vanner has been on the market nearly two decades, and the sales have constantly increased, it is safe to say it is the "Standard Machine of the World." More Frue Vanners have been sold during the last twelve months than for the same period at any time during the history of the machine. Practical mining men in all parts of the world where mining is carried on will testify as to its merits. It is the "standard" which all competitors are trying to imitate.

The results obtained by this machine are the "acme" of concentration, and several cheap and untried machines that have lately come on the market compare by it. The manufacturers will tell you that they are "just as good, and cheaper," etc. The facts are that no other concentrator made has an equal capacity, or will yield as clean a concentrate with as small loss in the tailings as the Frue Vanner. The amount saved from the lower first cost of an inferior machine counts little in the year's results, when compared with the increased output from a Frue. This machine not only gives better results at both ends of the belt (i. e., clean product and poor tailings), but is operated at less expense and requires less attention than any other machine on the market. At the Alaska-Treadwell mine, where they have ordered over 350 Frue Vanners, one man attends 48 machines for 12-hour shift.

California Asphalt and Bitumen.

California's hydrocarbon productions average in value \$2,000,000 annually. Of this amount, asphalt and bitumen form a large proportion. Discarding exact technical definitions, asphalt may be considered as the residue consequent upon the distillation of petroleum; bitumen, a sandstone impregnated with oil. In ordinary use the two terms are almost interchangeable, asphalt, geologically speaking,

by Louis Falkenau of a sample of rock taken from this mine gives the following:

| | |
|--|--------|
| Volatile at 130° Centigrade (200° Fahrenheit)..... | 1.470 |
| Petroleum..... | 12.967 |
| Asphaltene..... | 1.466 |
| Organic, not asphalt..... | .077 |
| Sand (silicious)..... | 84.020 |
| Total..... | 100. |

Brought in its natural state from the mine to the street to be paved, bituminous sand rock is melted and disintegrated in portable, steam-heated, double-

seven years ago and steadily advocated—drainage and deep mining on the Comstock, Nevada, lode. Twenty-three mining companies were represented at a meeting held last Saturday to devise practical methods to unwater the Comstock mines below the level of the Sutro tunnel. Resolutions were adopted requesting the superintendents of all the companies represented to report to the committee by the 14th prox. the condition of the several mines as shown by actual work below the tunnel level and their opinion

BITUMEN MINE, SANTA CRUZ COUNTY, CAL.

being the base of the bituminous rock, the most important of the latter deposits being of Miocene age.

In several counties of California, notably Kern, Kings, Fresno, Ventura, San Luis Obispo and Santa Cruz, are large deposits of asphalt and bitumen, which have at various times been scientifically described in these columns. Considerable has been done in the production of asphalt, and the constant "manufacture" of streets in San Francisco has deservedly brought bitumen into notice. On this page is illustrated a bitumen mine in Santa Cruz Co., which graphically portrays the general appearance and manner of mining; on page 181 is an engraving of another open-cut mine of bitumen in San Luis Obispo Co. It is from the mine portrayed on this page that much of the material used in San Francisco pavements of that character is taken. An analysis

walled kettles. When discharged as a black, sticky meal from the kettles, it is wheeled in barrows to the foundation it is to cover, and there spread with hot iron rakes to an even layer about 3 inches thick. Hot iron hand-rollers immediately pass over it, weighing about twenty pounds to each inch of tread, accomplishing initial compression. A light sprinkling of infusorial earth (a powerful absorbent with a natural affinity for bitumen) is then spread upon the surface, when the rolling process is renewed with large steam rollers weighing 300 pounds to the inch of tread. These rollers continue operation until the bitumen has received its ultimate compression and is cold. The street is then open to traffic.

AT LAST there is a practical movement toward the realization of the plan proposed in these columns

on the feasibility of the proposed work. The old mine is not worked out, but the old stock methods are. A consolidation of interests and a lessening of expenses by having one general management will be among the changes if the present effort amounts to anything practical. It is believed that, with the water out of the mines, the lode can be explored to the depth of 6000 feet. At the time the lower levels were abandoned and the clamor for dividends started the superintendents to extracting ore from the old upper levels, the Union Consolidated mine was down 3350 feet; the combination shaft 3250 feet. There was then but one deeper shaft in the world; there are now many deeper, one—the Calumet & Hecla in Michigan—being nearly 5000 feet deep. Deep mining on the Comstock should never have been abandoned and should be now resumed.

MINING AND SCIENTIFIC PRESS.

ESTABLISHED 1860.

Oldest Mining Journal on the American Continent.

Office, No. 330 Market Street, San Francisco, Cal.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Bitumen Mine, Santa Cruz County, Cal., 177.
Bitumen Mine, San Luis Obispo County, Cal., 181.
EDITORIAL.—California Asphalt and Bitumen; Drainage and Deep Mining on the Comstock, 177. Meeting of the American Institute of Mining Engineers; Iron and Steel Exports; Gold Bullion Receipts of '98; Unusual Activity in Mining; Corporation Stock Assessable; Practical Articles Wanted, 178.
MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 185-86-87.
THE MARKETS.—The Local Markets; Mining Share Market; Sales in San Francisco Stock Board, 198.
MISCELLANEOUS.—Concentrates, 179. Broad Arrow District, Western Australia, 180. Wood Rendered Non-Flammable; One of the World's Richest Mines, 181. Dredges and Amalgamators; Should Not Be Removed; Good Mill Work at Pony, Mont., 182. Coast Industrial Notes; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents; Recently Declared Mining Dividends; Recent California Mining Incorporations; Personal, 183. That Prehistoric Skull; The Repair Ship Vulcan; New Carbon Dioxide Engine; Points in Annealing Steel; A Unique Railroad in Oregon; Teak Wood of Hindoostan; Acetylene Gas; Putting Money into Gold Mines; Plan for Avoiding Smoke, 184. Commercial Paragraphs, 198.

Corporation Stock Assessable.

A recent decision in the Los Angeles Co., Cal., Superior Court is to the effect that in California there is no such thing as non-assessable stock in a corporation, that stockholders are responsible for the amount of assessments on corporate stock held by them, and that a corporation has no legal right to determine or limit a stockholder's liability therein. The plaintiff in the case was a corporation, suing the defendant, one of its stockholders, for payment of an assessment regularly levied on the corporate stock. Defendant had refused payment, exhibiting a contract made at the time of purchase with the company, in which the company agreed that the stock so sold defendant was "fully paid up and non-assessable." The court held that "a promise and agreement on the part of the corporation that it will never in the future avail itself of that power given it by positive statute to levy an assessment made necessary by losses or unforeseen disaster in business would be to assume that a corporation in the very beginning of its corporate existence, having undertaken a duty under the law and accepted a franchise, was voluntarily depriving itself of the only means of protection afforded it in the raising of money other than by loans, and waiving a right and power which the Legislature, in its wisdom, deemed necessary to confer in order that it might maintain its corporate existence.

"No power existed in the corporation to waive the legal right as to assessment on account of debts, or that the contract that no assessment would be made applied only to the unpaid subscription price. Accepting either theory, the stock issued to defendant remained assessable for the purposes for which this assessment was levied, notwithstanding the indorsement on the certificates."

WHILE so far in '98 gold bullion receipts from California are almost equal to that of previous years, yet it is evident that the prevalent drouth will occasion considerable decrease in the sum total for the year. From all parts of California come reports of unprecedented drouth, stamps hung up, placer operations suspended, and in many places an almost entire cessation of mining operations, that untoward condition of affairs extending north of the Oregon line. Statistics show that not in forty years has there been such a scarcity of winter snow and rain and such a lack of water, and every one affected hopes that such a failure in the operations of nature will not occur again in forty years to come. The drouth has occasioned great loss to California mining interests. In many instances considerable preparation had been made for an unusually busy season and large expense incurred, much of which is a loss. The only consolation to the California miner is that such things are sufficiently unusual to not require reckoning with next season, and that, meanwhile, the gold cannot rot nor run away, and will be secured later on.

Practical Articles Wanted.

In its thirty-eight years of continuous and successful existence this paper has made the interchange of ideas and personal experience one of its strongest features, thus constituting it a medium of communication between progressive men, mutually aiding each other. Such contributions are always welcome, and those who feel so disposed are hereby requested to note the value to themselves of such articles and in their own case to make such contribution as they feel their knowledge or experience justifies. No one is asked to send all he knows, but many of our readers know a good deal about some one thing connected with progressive mining and on that particular thing each is here individually asked to send a few practical points that will doubtless be of considerable value to others elsewhere who are in doubt on the very matter that he has successfully solved. Everybody is wiser than anybody, and in a technical paper like this much of its practical value is due to articles written by men who have in their own experience proved that what they are writing about is an accomplished fact.

The suggested description or discussion can be as long or as short as its writer may deem necessary. Sometimes 100 words will tell all that is needful; in other cases 2000 may be needed to properly explain the matter under discussion. Sketches, photographs, and, in fact, all manner of illustrations can be used (except "blue prints"), the engravings made therefrom embellishing and adding to the value of the communication.

Quite often the impulse exists, but a man is too busy or too tired. Yet nearly every intelligent miner has some time in his life done something in his line that he is proud of, or that he thinks or feels is about as good as any one else could have done under the circumstances; something hard, or unusual, that took all his wits to make a success, or at least not a failure. There are a thousand things in mining that deserve the notice and world-wide publicity accorded by publication in this paper, and any one, anywhere, who reads this will please consider it a special invitation to him to write down such an experience of his and send it to us. Here are about a hundred suggestive topics that occur to the mind of the writer during the time devoted to the writing of this article:

How to best save the fine gold when milling cemented gravel in drift mines; an example of successful co-operative mining; profitable working of a custom stamp mill; the building and operation of a wing dam; best arrangement for drop of stamps and why; experience with hydraulic elevators; improvement in arrangement of pipe lines and delivery of water through monitors; daily work of a small cyanide plant; leaching carbonate copper ore with sulphuric acid; results of this season's river mining; cost of mining and milling gold ore; practical method of mine examination; economical work in running a tunnel in hard ground; treatment of low-grade copper ore; relative value of electric and compressed air power, by one who has tried both; how a fire in a shaft was successfully handled; sampling lead ores; retorting amalgam; main requisites in a mining report; improvements in gold milling; use of liquid chlorine in chlorination process; proper contour of silver-lead furnaces; example of profitable treatment of mine tailings; how a leaser made his lease profitable; new points in mine timbering; successfully resisting a "claim jumper"; best location and arrangement for a gold mill; experiences of a prospector; overcoming of machinery transportation difficulties; system of fire protection in a mining camp; building a pipe line; satisfactory instance of "profit sharing"; wear and tear of shoes and dies; best disposition of smelter slag; record of unwatering a mine; building and maintaining reservoir dams; successful record of a California debris storage dam; timbering in drift mines; utilization of waste water; admission of visitors into a mine; relative value of zinc dust and zinc shavings in cyanide process; amalgamation tests; relief in case of mine accident resulting in personal injury; best arrangement of 10-stamp mill; successful securing of gold from black sands; to obviate loss in scorification assays; use of chuck-block in mortar; working with an arrastra; assaying concentrated sulphurets; slow vs. rapid-drop stamps; prospectors' drill; cam improvements; belting on concentrators; incline vs.

vertical shafts; river dredging; mining low-grade cinnabar ore; ditch and flume building; wooden vs. iron battery frames; lead dust accumulator; raw-hiding ore; flashlight photography; practical working of miners' unions; battery sizing boxes; sharpening drills; effective form of rolls; making valuable an abandoned mine; what a dry washer can do; proper duties of a mine foreman; removal of amalgam from copper plates; economic matting of sulphide ores; ore sampling in mill; organizing a joint stock mining company; one day in a mine manager's active duties; development of a "prospect" into a paying mine; successful drainage of a deep shaft; ventilating a drift mine; best weight for stamps; suitable arrangement of mill building on site; putting off large quantity of blasting powder; vertical vs. horizontal engine for stationary work; how "assessment work" is done; experience with iron riffles as a gold saver; timbering an incline shaft; changes in stamp practice; developing a prospect; selling a mine; operation of an amalgamator; details of cost of 6x8 tunnel; some ultimately successful mistakes; transmission of power; oil as fuel; spontaneous combustion; ore sorting; mine inspection; application of belts and pulleys; utilization of water power; cleaning up after a cave; good method of bank blasting; concentrator work; improvements in sluice building; ore amalgamation in the mortar; chlorination tailings as flux in smelting galena; best ore crushing for cyanide process; errors in mill construction.

The above 104 proposed topics are merely suggestive; as many more, probably better and equally practical, will readily occur to many of our readers, the idea being to illustrate the manner of mining work that could with common profit to the mining world be presented in this open forum. "My light is none the less for having lighted that of my neighbors," and in all ages the passing on of a light has symbolized the increase of knowledge in all the useful arts and sciences. Science is organized knowledge; art, its application; and in all the wide domain of arts and sciences none is more generally useful than the art and science of mining; no men are better fitted to give instruction therein than those who have successfully solved so many of its problems and worked them out in practical detail. It is from this class of men, scattered throughout this west half of America, that this journal cordially invites such communications, that their work may receive permanent record herein and be of value to so many others also at work in the development of this nation's great basic industry.

WITH peace comes promise of unusual activity in mining. Competition in other forms of business makes possible only slight interest, if any, on the shrewdest investments; the absence of ruinous competition and the unrivaled opportunity for co-operation must make mining a favorite form of investment. Mining was the pioneer industry throughout this region from the Rockies to the Pacific; it continues pre-eminent; it transcends all others in its commercial relations; it supplies solid, indestructible wealth, and upon its success rises or falls all other pursuits. It has been noted that the miner is not a competitor; a new farm or a new factory or a new store means more competition; a new mine means more consumers, more customers for all other industries without competition with any, and the miner is a good customer; he excels in the number of dependent industries he keeps in operation. Each miner affords employment for ten additional men—the merchant, the machinist, the manufacturer, the farmer, the stock raiser, the dairyman, smelters, mills, railroads, suppliers of every kind get generous share of the wealth he produces. He creates the best cash market, consuming the products of others without competing in their production.

THE seventy-fifth meeting of the American Institute of Mining Engineers will be held at Buffalo, N. Y., beginning Tuesday, October 18, 1898. The local committee of arrangements has been appointed from the Engineers' Society of Western New York, and communications may be addressed to Mr. W. C. Johnson, Niagara Falls, N. Y. An excursion, at reduced rates, to the Omaha Transmississippi and International Exposition is proposed.

Concentrates.

LONDON will hold a Mining Congress in 1899.

HEAT and silver seem to be once more resuming partnership.

ANY good miners claim that all gold is free in ore except allium ore.

ERS of advertising space in this paper get a larger circulation each week.

r the Trail, B. C., smelter, which blew in last week, over men are employed.

r Dawson City, N. W. T., to-day, the sun rises at 4:24 a. and sets at 7:30 p. m.

CORPORATION, a citizen, a woman or a minor may each have a valid mining location.

AT live paper, the Los Angeles, Cal., *Review*, has added word "Mining" to its title.

OLD is ordinarily absorbed by new copper plates at about one grain to each ton of ore milled.

ie Baker City, Or., *Democrat* estimates that 1000 men work in the mines in that vicinity.

UTCHER location of 160 acres by an association requires a survey of mineral on each twenty acres.

ie U. S. assay office at Spokane, Wash., handled over 90,000 in gold during the last two weeks.

HEX the printed and written part of a contract do not the written controls its interpretation.

HEZ mining machinery is now being sold in Baker Co., on, than at any time in the last five years.

ie resumption of work in the Moulton mine at Butte City, t., will give employment, it is said, to 600 men.

Glenwood Springs, Colo., Aug. 22d, a double-handed drilling contest will be held. The prize is \$700.

GRUBLENDE granite used to be called "syenite." A true ite has scarcely any quartz, and rarely more than 50%.

ie Denver, Colo., Mint, the first week in August took in 153.33, a gain of \$153,501.53 over the corresponding week of '97.

DATE Hale & Norcross has levied assessments aggregating \$5,800,000. Sierra Nevada assessments aggregate \$9,010.

ie refined gold product of the Selby Smelting & Lead Co., an Francisco for the year '97 was of the value of \$90,000.

ie Sutter Creek, Cal., *Record* states that there is no in- of a shortage of water in Amador county for the next months.

ie Lincoln Co., Nevada, gold ore of the value of \$6.50 per ton must clear itself; silver ore must have a value of \$19.50 on to pay expenses.

ie ten-cent stamp on a proxy used for voting at an elec- of officers in an incorporated company without regard to number of signatures.

ie meeting of mill and smelter men at Anaconda, Mon- on the 13th, a union was organized, the largest union of er men west of Chicago.

ie average price of quicksilver in 1883 was \$27.25 per flask; highest price on record in California was \$1.55 per lb. in the lowest 33 cents in 1879.

ie capacity of the reservoir recently completed for the ado-Creston M. Co. at Minas Prietas, Sonora, Mexico, is capacity of 34,000,000 gallons.

ie the Gila Valley, Globe & Northern Railway, Arizona, 300 re working in the construction gang. The most west- camp is twenty-one miles from Globe.

ie lack of water has seriously interfered with all kinds of ing operations in California this year, in many sections oc- ing an almost entire cessation of work.

ie is believed that M. W. Belshaw, who died at Antioch, last April, made at Cerro Gordo, Inyo Co., Cal., the first e the world of water jackets on furnaces.

ie buildings of the Montana State School of Mines in t., Montana, are completed. They will be opened to stu- as soon as sufficient funds have accrued.

ie association has been formed in New York City to bring er the men in the West who have mines to sell and the n the East who have money to so invest.

ie Apod test of the qualifications of an assayer is his ability ck with the smelters on their shipment pulps. In gen- cheap assaying" is not worth what it costs.

ie mixture of one ounce sulphate of copper, one-quarter of alum, one-half teaspoonful salt, a gill of vinegar and y drops of nitric acid will "cut a hole in steel."

ie Along the mineral exhibits of Montana at the Omaha, t Exposition is a specimen of silver-copper glance from eversweat mine at Butte that weighs four tons.

ie ERAL AUTHORIZATION can be given to sign a name to a l sale of a mining claim, but such a verbal power cannot en to execute a contract for the sale of real estate.

ie PRICE DRAKE of the Supreme Court of British Columbia id that limestone is a mineral and can be located under e mineral act where it is not mined for building purposes.

ie A RECEIPT for the payment of money does not require a ur, unless the receipt is used to circumvent the use of a eor draft which ordinarily would require such a stamp.

ie SOUTHERN CALIFORNIA suggests the establishment of a min- g lege at State expense, in addition to the Department ing and Metallurgy at the California State University.

ie AONT, Mont., correspondent says that at a drilling con- here July 4th the double-handed driving showed 32 b in fifteen minutes, which, if so, beats the world's ol.

ie In the White Crow mine at Sunshine, Colo., S. McGuire isled last week by the explosion of a charge of powder ie he was tamping; it is supposed he struck the fulminat- g sp.

ie The railroad is to be extended eighty miles westward from lld, Utah, to Stateline, over the old Union Pacific grade e years ago. Three hundred miles more will take it to w, Cal.

ie NING in the Sierra forest reserve regulations permit the tment or entry of agricultural lands subsequent to res- on. Provision is made, however, for the location and t of mineral lands therein.

ie MINING AGENTS throughout the States of Mexico have e requested by that Government to secure specimens and

samples of ore from the mineral districts which they repre- sent for Mexico's exhibit in Paris in 1900.

THE U. S. Mint pays for gold \$18 60 per ounce standard .9 fine. There is no charge for colnage where the bullion depos- ited is suitable therefor. The depositor gets 100 cents for every 23.22 grains Troy gold in his deposit.

It was in '91 that the MINING AND SCIENTIFIC PRESS began the advocacy of deep mining on the Comstock. To that date the forty-nine incorporated companies had levied assessments \$77,920,385, and had paid in dividends \$120,553,770.

OF any stream on public land and subject to appropriation, anyone may appropriate any of the water not already appropri- ated. A later appropriator cannot diminish or otherwise interfere with the full supply of a prior appropriator.

THE Denver Mining Record declares that "the silver miners of Colorado are certainly to be congratulated on the growing interest in the white metal. It is not improbable that it will be 80 cents or higher before the close of the season of 1898."

IF an agent, administrator, executor, trustee, or any other person acting in a fiduciary capacity deposits funds that come into his hands as a trust in a bank in his own name, and the money is lost by failure of the bank, he can be held personally liable.

WHILE officials in different States have held that assessed and unpaid taxes are a collectable lien on unpatented mining claims, it is believed that prospectors and locators are safe in exercising their individual judgment as to paying or refusing to pay such levy.

THE horse power of a water supply can be determined as follows: Multiply number of gallons flow per minute by pressure in pounds per square inch, and divide by 1500. The pressure in lbs. per sq. in. is the product of the number of feet fall multiplied by .433.

THE Mount Morgan, Australia, mine paid last month a dividend of \$20,166 13s 4d—7d per share. This property was opened in '86; it is a pulverized mass of finely comminuted particles, unique in its conditions, and was for several years noted as the "greatest gold mine in the world."

GILSONITE is used in the manufacture of water proof paint, for painting the bottoms of iron ships and seawalls. The gilsonite found at Middle Park, Colo., is said to contain from 93 to 95 per cent carbon, of which only 40 per cent is volatile. The Utah gilsonite contains 88 per cent carbon.

A STEAM PUMP dispenses with the usual long rods connecting the ram with the piston. One self-contained machine includes the steam cylinder and water ram. The steam that supplies the power is conveyed from the surface; the displacement is produced either by single or double-acting ram or piston.

A DETAILED statement of Sicilian sulphur exports shows that the shipments to the United States were 164,875 tons in 1897-98, against 115,535 tons for the preceding year. This is an increase of 49,340 tons, and this has all occurred during the last half-year—that is to say, during the first six months of 1898.

OWING to the extreme heat, the Old Dominion Copper Co. at Globe, Ariz., made a change in the working hours, greatly appreciated by the employees, nearly all of whom are employed on surface work preparing for improvements and additions to the plant. They go to work at 5 o'clock a. m. and quit at 2:30 p. m.

CRYSTALLIZED CARBOLIC ACID is made by distillation from coal tar products. It is liable to become colored by age and exposure, but is not materially injured thereby. The addition of 8 1/2 drachms (or 33 gm. by weight) of water to each 500 gm. of this acid will render it permanently liquid and ready for use.

THE new ore bin of the Silver Lake mine at Silverton, Colo., is 98 feet long, 49 feet wide and 72 feet high, and has a capacity of 16,000 tons. There are four floors in the building and eight ore bins. The new tramway connecting the mine and ore bin is 6000 feet long. The total length of the tram lines is 15,000 feet.

TO BE constantly quoted is a sure sign of good journalistic work, as it is an expression of favorable opinion from the best judge—the exchange editor. It is always gratefully appreciated, still, if some of our contemporaries will credit one-half or one-third of what they clip from this paper it will be of additional satisfaction.

A PLACER is not to be expected to be immediately productive and profitable as soon as water is put on the ground. A placer must be opened and put in shape before it can produce profits, equally as well as a lode mine, and putting water on it is only the first step in development. Usually it requires at least one season after water is on the ground to open a placer so it will pay profits.

ZIRCON in certain varieties is cut into gems, and as such exhibits more fire than any other known gem except the diamond. It is an adamantine, variously colored, transparent to opaque zirconium silicate (ZrSiO₄), crystallizing in the tetragonal system. It occurs in crystalline rocks, especially granular limestone, chloritic and other schists. The smoky zircon is found in Ceylon and the pale in Norway.

REGARDING the H. P. of a steam boiler, with feed water at 100° Fahr. and a steam pressure of 70 pounds by the gauge, 30 pounds of water evaporated per hour is a H. P. To determine the power developed, divide the total number of pounds of water evaporated per hour under these conditions by 30. With good natural draft, using a well set tubular boiler, 15 square feet of heating surface will furnish a H. P.

THE heaviest substance known is the metal osmium, whose specific gravity is 22.477, while that of gold is \$19.265, lead 11.367, iron 7.79, and lithium—the lightest solid—is only 0.594. Osmium is also the most infusible of the metals. It resists the oxyhydrogen flame of 3550° Fahr., in which platinum and iridium flow, and is even almost entirely unaffected by the electric arc, which readily melts the extremely refractory ruthenium. It was discovered by Tennant in 1803, and is found in iridosmine and platinum.

THE French Consul-General makes the following statement, of interest to lead exporters engaged in trade with France: "As Spain has decided that on and after July 1, 1898, an export duty of 5 per cent should be exacted from silver-bearing lead leaving the country, an Act of the French Legislature of March 3 makes it imperative that a countervailing duty of 30 per cent per 100 kilos (220 pounds) be exacted from Spanish lead not silver-bearing coming into France. Importers of lead not silver-bearing of any other country but Spain into France must, in order to avoid the countervailing taxation, show by a certificate of origin, to be delivered by French

consuls at the port of shipment, that the goods do not directly or indirectly come from Spain. No new duty has been collected since Aug. 1." Nearly 3,000,000 pounds of lead are yearly shipped from the United States to France.

THE disclosures of Hooley, the London promoter, continue to be interesting. Lord de La Warr, chairman of the board of directors, got \$25,000 for the use of his name, and Lord Almarie £25,000 more. The man who "fixed" the London financial papers got £10,000. Finch Hatton, brother of Lord Winchelsea, arranged with the little London papers "not to pull the company to pieces." On the counterfoil of many checks was found written: "For quieting papers generally on pneumatics." Among the papers "squared" were the *Pall Mall Gazette* and the *Financial Post*. The editor of the *Corporation of British Investors* got \$2000 to "stay quiet." Hooley paid Lord Deerhurst £2000 for introducing him to Lord Ashburton. He also paid Mr. Aliston Hay £1000 for introducing him to Lord Norbury. Ordinary dukes, knights and marquises were secured at low figures, but "Lords" came high.

INVESTIGATION by Dr. Le Neve Foster into an underground fire at the Snaefell lead mine, Isle of Man, has brought to notice some interesting facts concerning carbonic oxide poisoning. This gas, though occluded by certain rocks and minerals, is never a natural constituent of the atmosphere of mines, and Dr. Foster satisfied himself that the twenty victims of this fire were killed by carbonic oxide from the burning timber in the mine. A small fire was found to give dangerous properties to a startlingly large volume of air. The burning of a cubic foot of larch produced enough carbonic oxide to occupy 417 cubic feet of space, and enough noxious gas is contained in 25 cubic feet of timber to give 1 per cent—sufficient to cause quick insensibility and death—all through the mine. A valuable agent in restoring still living sufferers from carbonic oxide is oxygen, and it is recommended that cylinders of this gas be kept convenient for immediate use in case of necessity.

IN *Gillis vs. Downey*, 85 Fed. Reports, 489, U. S. Circuit Court of Appeals, the court decided that the filing for an application for a patent does not suspend the obligation to keep up the required annual work where, without paying the purchase money, the claimant permits his application to sleep for years; and upon such failure to comply with the conditions the claim is open to relocation in the same manner as if no location had ever been made. The fact that the sixty days prescribed by the laws of the United States (Revised Statutes, 1878, section 2325), for publication of a notice of application for a patent has expired before the application is addressed, does not preclude a contest of the applicant's right to a patent, where the adverse claim does not arise until after the expiration of the sixty days, and where the applicant has allowed his application to lie dormant for years without either paying the purchase money or doing the required work each year.

A CAR is often wanted in drifting, and in quartz mining in places where iron trucks and trimmings are not to be had, Philip Minor says, a wooden truck built as follows is better than none. Cut two round sticks 10 inches in diameter and 3 feet long. Find the center of the ends and saw around them, leaving bearings 2 inches long and 2 inches in diameter, dressing them true and smooth. Cut the flange 2 inches farther back, making the wheel as true as possible 8 inches in diameter, 2 inches tread, with flanges 1 inch high. Cut away the surplus wood in the middle of the sticks, leaving only enough for strength. Make a box frame of plank or split lagging 3 feet square, 8 inches high, and cut notches in two sides 2 inches deep for bearings, 2 feet apart, and rabbitt them with bacon rind. Lay a platform on top and set a tub or box on that, tipping it off to empty it. Lay a track of split poles, with the bark and knots trimmed off, 22 inches inside gauge, and it is ready for straight ahead work. By using only one roller and putting handles on the frame, a very handy truck is made, to carry twice the load of a wheelbarrow.

HAULAGE ropes are generally made of steel wire. According to a paper in the *Zeitschrift des Vereins Deutscher Ingenieure*, ropes of aloe fiber may still compete with steel, even for deep shafts. The aloe fiber is stronger and more elastic, but less flexible than Manila hemp; its chief advantage is that it becomes stronger in damp places. The ropes have to be tarred, but in spite of this circumstance the corresponding lengths of rope which would break by virtue of their own weight are 12,000 for aloe and 12,500 for steel. In Belgian mines haulage by means of aloe ropes is quite common; great lengths are made with decreasing thickness. A new style of rope is "the simplex," recommended for telpher lines, but not for haulage. These wires are tubular. All the wires being visible from outside and pressed against one another, breakages are said to be unlikely. Three wires of this type have been placed in a lake near Amsterdam. The laying is very quickly accomplished. The process only is indicated. Over a lead pipe, about 2 inches in diameter, 1-6 inch thick, an impregnated texture is first applied, and this then wound with 3/4 inch "fasson" wires. An outer layer of cloth, held by galvanized wires, is then added, as a protection against rusting. The finished pipe would have a diameter of 82 millimeters, 3.23 inches, weigh 20 kilogrammes per meter, and cost 16 marks—a high price.

At Magog, Quebec, Canada, air is automatically compressed by a column of water flowing down a pipe in a shaft. The water is received in a tank, from which a vertical pipe descends in a shaft. The air is carried down in this vertical pipe with the water, being drawn through a series of small pipes at the head and carried down in the water in the form of small globules and delivered in the compression tank at the bottom, the compression being produced by the presence of the back column of water, each 27 feet of shaft depth producing one pound of air pressure in the cylinder. The water absorbs from the air the moisture contained in it and delivers the air dryer than the atmosphere, and at the same temperature as the water. A local paper says: "In the plant described 150 air horse-power is produced, and an efficiency of 62 per cent is obtained. In other words, out of a given theoretic horse-power 62 per cent of actual air horse-power was delivered at the engines, and with slight modifications 70 to 75 per cent has been obtained." "Suppose," says J. T. Grayson of Toronto, "such a plant was used in the Comstock mines, for instance, where water is carried down in pipes 1600 feet. The result would be a pressure of fifty-nine pounds at the bottom. This used in a second and third compressor could give an air pressure of 2000 pounds, with which liquid air could be produced. With such a plant, liquid air would result in bringing the Comstock once more to the front as the greatest producer in the world."

Broad Arrow District, Western Australia.

TO THE EDITOR:—English capital has favored the Broad Arrow gold field more than any other district in Western Australia, but from this district it derived less profit than from any other. The aggregate capital of the mining companies operating in and about Broad Arrow is something like £6,000,000 (or \$30,000,000). There has been absolutely no return for the enormous expenditure made. Many other districts have a quota of poor mines, but the drear aspect of worthless and wanton mining speculation is relieved in most cases by the display of at least one payable mine. All the mines that have crushed in the Broad Arrow district have closed down immediately following the crushing. It may have been the misfortune of Broad Arrow that the poorest mines have been the first floated, but to my knowledge the last mine that crushes shows the poorest returns. So far they are all worse.

The principal companies operating in Broad Arrow are:

| Name— | Capital. |
|------------------------------|----------|
| Hit or Miss Proprietary..... | £180,000 |
| Black Flag Proprietary..... | 600,000 |
| Arrow Brownhill..... | 100,000 |
| Arrow Proprietary..... | 135,000 |
| Bardoc..... | 100,000 |
| Big Blow..... | 150,000 |
| Blackette..... | 60,000 |
| Black Flag Consols..... | 140,000 |
| Credo..... | 100,000 |
| Dixie..... | 85,000 |
| Gladiators..... | 120,000 |
| White Feather..... | 380,000 |
| White Flag..... | 130,000 |
| Talisman..... | 80,000 |
| Lady Bountiful..... | 50,000 |
| Hill End..... | 250,000 |
| Half Mile Reef..... | 150,000 |
| Two Golden Crowns..... | 200,000 |
| Golden Arrow..... | 200,000 |
| Paddington Consols..... | 175,000 |
| Paddington South..... | 175,000 |
| Duke..... | 175,000 |
| Reison's Reward..... | 75,000 |

The principal crushings have been 225 tons from the Hill End, before flotation, for 2482 ounces; 452 tons from Hit or Miss for 655 ounces; 917 tons from Half Mile Reef for 609 ounces; 119 tons from Golden Arrow for 75 ounces; 153 tons from Gladiators for 118 ounces; 300 tons from Arrow Proprietary for 47 ounces; 200 tons from Dixie (before the reef cut out) for 804 ounces; 800 tons from Talisman for 40 ounces. The Black Flag Proprietary crushed about 1000 tons per month for 4 dwt. per ton.

Reison's Reward, the first claim located on the Broad Arrow gold fields, is the most noteworthy here. Its discovery happened in an unlooked for way. Young Reison, who was on his way into the desert, prospecting, seeing rain coming on, decided to pitch his tent and hobble his camels. He was considering for some time whether he should stop on the rise where Reisons is located, or move on farther to the rise whereon the Hill End now stands, but the aspect of the clouds made him decide on Reisons. The rain came down very heavily during the night and the next morning, with a bright sun shining, Reison found the ground about him sprinkled with nuggets. In two hours he picked up over 200 ounces of gold, the largest piece weighing 69 ounces. He immediately went back to Coolgardie, applied for the claim and got back before anyone had found his tracks. In the following two months he took out over 2000 ounces and found a float leader of wonderful richness. When the leader was found the gold on the surface (alluvial) was about exhausted, and, as the boom was on, Reison determined to take out all he could without spoiling the flotation of the claim. He followed the leader—which was about 10 inches thick—90 feet, and in that distance it made only 10 feet towards the vertical. He gouged out all the payable ore except a shell, which he left along the drives, and, after having dollied out about £16,000 worth of gold, sold the claim on the strength of the leader for an additional £16,000. The purchase of the claim involved either great stupidity or dishonesty, for a single hole drilled and fired in the leader afterward proved the hollowness of the affair, while the subsequent flotation showed the purchasers in a bad light. The main shaft is now down 320 feet and has passed through three different lodes of an average width of 40 feet. In my opinion these "three different lodes" are but one lode, having three "breaks," occasioned by bars of diorite, which throw the lode back. However, there are not ten tons of payable ore in the lode, although there are patches of telluride of extraordinary richness.

The Hill End was the second claim located in Broad Arrow. Its mainstay is a body of quartz from 10 inches to 2 feet thick, proven to a considerable distance and to a depth of 200 feet. The original owners took out over £10,000 worth of gold from this reef by dollying, and sold it to Dr. Symon for £40,000. With a 3-head battery run by an oil engine Dr. Symon recovered his purchase money in three months. Since then, however, nothing has been gotten. A Krupp ball mill, with a capacity of thirty tons per day, has been erected, but has not as yet cleaned up, although the amalgam has been accumulating several months. From the developments I believe this mine should keep a 10-head battery running several years on 1-ounce stone. The people here, however, will never give in to an ounce

average. The Hill End is their chief mine for the time, and they will have it go 2 ounces or more. They can never realize that Broad Arrow is a first-class 10-dwt. district and has met a setback simply because it was floated on a 4-ounce proposition. It is very lucky, for the place, that the Hill End is controlled by a reliable company, who are satisfied with moderate profits and no not wish to make any on the share market.

The Duke mines comprise the largest acreage of any property in the Broad Arrow district. The mines are located two miles north of Broad Arrow and consist of the Duke, Duke Extended, Duke South and Aurora. The Duke main shaft is now 260 feet deep and is to be taken down to 500 feet without delay. Considerable work has been done on the principal body of ore, which was found at 120 feet. This ore occurs as a deposit and is the result of upheaval and subsidence. A more kindly quartz, or quartz more pregnant with the precious metal, is hard to find in any part of the world; but a reef, as some presume to call it, more erratic does not exist. The erratic nature of the Duke lode may be partly imagined from the fact that decomposed rock is found at 260 feet in the main shaft, while at the surface, and not 20 yards distant from this shaft, unaltered rocks outcrop. The lode, of course, has been found to be disturbed to the greatest extent in this decomposed zone near the unaltered outcropping rocks; but whether the decomposition of rocks is responsible for the disturbance of the "reef" remains to be proven. I consider the disturbance is due to slow motions during the more or less saturated condition of the decomposed material creeping downwards on an inclined plane of unaltered rock, as well as to collapse caused by loss of support of the former wall rocks. In other mines in this district similar conditions prevail as in the Duke, but in a less degree, notwithstanding which, however, the loss of the mineral contents of the reef is greater. As the Duke is the best example of the Broad Arrow lodes, it may be as well to describe it and to offer an explanation for the loss of mineral contents in other reefs through disturbance. The decomposition of rock as visible in the Duke was caused by the atmospheric waters, which, before reaching the earth, held in solution valuable quantities of carbonic acid, oxygen, nitrogen, ammonia and various nitrous compounds, and which, coming in contact with decomposing vegetable matter at and immediately beneath the earth's surface, dissolved therefrom phosphates, potassium, silica, manganese and calcium, together with certain organic acids, all of which are most effective agents in the decomposition of the crystalline silicated minerals and the redistribution of the soluble matter. The most important agent was carbonic acid derived, during the earlier geological periods, principally from the atmosphere, and latterly from vegetable oxidation at the earth's surface. By the power of this acid of dissolving and removing the alkaline and earthy silicates from crystalline rocks have resulted the stratified sedimentary slate which is the "country rock" in the Duke. Other important agents were the organic acids, which have such a strong affinity for oxygen that they will readily extract it from such insoluble products as the peroxide of iron and manganese, converting them into protoxides, which are readily soluble by carbonic acid or by an excess of organic acids themselves, which by this reaction become oxidized to carbonic acid and water. They also have the power of extracting oxygen from soluble metallic or earthy sulphates, converting the former into insoluble sulphides. By this means not only the greater part of the iron and manganese found as lodes and deposits in the stratified and altered rocks of the district have been derived originally from the decomposition of crystalline rocks brought into solution by circulating waters charged with carbonic or organic acids, and precipitated by oxygen as peroxides most readily at or near the surface, but to the reverse action much of the metallic sulphides found in deposits owe their origin. The rocks here are principally crystalline, composed of feldspar, consisting of the silicates of lime, soda or potash combined with the silicate of alumina, and hornblende, consisting essentially of silicate of lime and magnesia combined with the silicate of alumina, together with iron and manganese. The actions of the atmospheric waters on the minerals contained in these rocks would be as follows: The affinity of carbonic acid for lime, soda, potash and, at times, magnesia is so strong that this acid will attack and break up their combination with silica and many other combining acids. Owing to this powerful affinity of carbonic acid for the alkaline and calcium silicates contained in the feldspars, it is thus enabled to seize upon and remove lime, soda and potash as bicarbonates, dissolving them, together with the greater portion of the silica originally combined with them, leaving behind (where the leaching has been complete) the insoluble silicate of alumina, combined with a definite portion of water in a fixed state—known as kaolin. The basic minerals—hornblende, pyroxene, etc.—are similarly attacked by carbonic acid, changing the silicates of lime and magnesia to soluble bicarbonates, at the same time liberating the silica originally combined with them in a soluble form. In this way the composition of the minerals forming the crystalline rocks are not

only broken up by the action of carbonic acid converting their lime, soda, potash and magnesian silicates into bicarbonates, but, where the organic acids are also present in sufficient quantity and leaching has been completed, the whole of the iron and manganese ore are brought into solution. It is evident that, as a result of these reactions, where the flow of solution is sufficient to leach the soluble products of decomposition as soon as formed, the minerals, whether feldspathic or basic, so acted upon will eventually have been deprived of the whole of their lime, soda, potash and magnesian silicates, together with manganese, iron, etc., leaving behind little else than the hydrous silicate of alumina as kaolin. The conversion of such minerals to pure kaolin, however, is rare, occurring only among the most favorable conditions of mineral decomposition and leaching. In a dry climate such as this, with but slight drainage falls and insufficient solution to carry off the soluble salts, these must still remain to a large extent, mixed with the insoluble alumina and ferric and magnesian oxides. Kaolin occurs under such conditions only in connection with lines of freest percolation. Although the silicates of lime, soda, potash and magnesia are each converted into soluble bicarbonates by the action of carbonic acid, this acid exhibits a partiality towards certain salts. For instance, when in two adjoining rocks, the one containing potash feldspar, the other soda feldspar, the latter will be decomposed much more readily than the former, and by the removal of the decomposed material will eventually become a valley, and by receiving more than its share of the water from the higher ground may in time be very deeply decomposed, while the more resisting rock may be comparatively unaltered even near the surface. Should rocks of this class alternate at short intervals, deep channels of decomposed material may be found with walls, pillars or irregular bodies of unaltered rock between. In the lime-soda feldspar it is found that the lime is attacked more readily than the soda, while magnesia has such slight affinity for carbonic acid that it will readily exchange this acid for silica in the presence of silicate of lime and, often, soda. This selection of one base in preference to another by carbonic acid often results in the removal of, first, lime, then soda, from partly decomposed rocks of mixed composition, leaving the greater part of the potash and magnesian silicates in a state of comparative stability, but which must eventually yield to the slow but inevitable attacks of carbonic acid and be completely decomposed and changed to soluble bicarbonates and silica. This explanation may help to excuse the flotation of the Duke for £175,000, considering the fact that subsequent to flotation the extraction of 5000 tons of 4-ounce ore left the mine practically worked out.

The Paddington Consols was floated under the auspices of the London & Globe Corporation. The mine contains the only true vein in the district, but unfortunately, the vein contains no gold. A 20-head battery is on the mine and there is plenty of water to run it. At the 100-foot level the lode is 40 feet wide and the reef 7 feet. At this point the lode has been run on 1200 feet. The main shaft is down 200 feet. A large flow of water has prevented further sinking.

The Black Flag Proprietary is a glaring case of bad mining. Five hundred and twenty-five thousand pounds were paid for this mine, and with a 50-head mill running enough gold cannot be produced monthly to pay for wear of the stamps.

The Paddington South is situated on the Mon and Paddington Consols line of reef, and is one of the choicest wildcats on the line. Two years ago the reef was reported to carry 3 ounces gold per ton a through, but up to the present it has not produced enough gold to gild a nickel. Many managers have had to do with this property, and each successive manager has vied with his predecessor in extolling the praises of the mine, and none of these managers are ignorant of mining. When one looks at the white, hard, barren, horse-sickening quartz of the mine and hears its praises sung by the person in charge, one is convinced that it takes such a person to run a wildcat.

Other mines in this district which merit condemnation on the same scale as the preceding are the Golden Arrow, Hit or Miss Proprietary, Gold Crown, Arrow Proprietary, Credo and White Feather. Most of these were floated without justification. Of course, dishonest managers are to blame, but the iniquitous policy of London directors of appointing the accountant under the manager lessens the latter's responsibility. If the mine manager is not thought trustworthy he should never be employed, but when he is placed under the espionage of an inferior the directors are shown to be too suspicious to be trustworthy. In fact, the directors engage the accountant as a spy who must force the manager to dishonesty. The accountant is required to write out the manager's reports and to post them after obtaining the manager's signature. I know cases where pages of the manager's reports were withheld and others substituted, and cases where figures were changed after the manager had attached his signature. This work was attributed to the London directors who were manipulating the stock. Here, of course, this is a matter of our

ut under the Stars and Stripes, I am pretty sure, the persons concerned would be speedily utilized by the State. When I consider how extremely tricky the cute Yankee is made out to be by the English, as well as other Europeans, I can not refrain from remarking that if such outrageous operations as are performed on the London public by London directors were attempted in America those attempting would be swung up. For instance, the Nerrin was floated as a proved mine, with reef proved to 300 feet, of an average value of 9 ounces per ton and width of 3 feet. The first crushing was 400 tons of an average value of 34 dwts. per ton. The public now hold all the stock. Such a thing could not happen in America; but if it could, something else would happen afterward. At least it would be a case for the police.

In conclusion, it is pleasing to remark that some of these wildcats will some day be tamed and become real good low-grade mines, averaging 10 penny-

One of the World's Richest Mines.

Mining for copper was begun on the Keweenaw peninsula of northern Michigan in a small way in 1866, and has since continued uninterruptedly. In less than a third of a century the Calumet and Hecla mine has paid in dividends \$53,850,000, and has on hand in cash, bills receivable, copper, copper mineral and supplies, property which would realize \$5,000,000 more within a few weeks, this not including the millions of dollars worth of machinery or the mine itself, which on the basis of recent stock sales is worth \$55,000,000. To develop this mine assessments of \$1,200,000 were levied, which have been returned forty-fold. The mine pays quarterly dividends of \$1,000,000. This sum is below the net earnings of the mine, which with copper selling at 12 cents a pound is nearly \$6,000,000 a year. President Agas-

shareholder. There are several single shareholders who have millions invested in the stock of this one mine, while there are hundreds who have but a single share or two. Many of the employees of the mine have systematically invested their savings in the shares of the property for years, and, through the steady appreciation of the stock and the dividends returned, have grown independent. One man who began twenty-five years ago as a surface laborer at the mine, just over from Germany and without a dollar other than earned with his hands, now owns over 500 shares, worth \$250,000. Every dollar saved was invested, every dividend paid him was made to buy more stock. There are many old employees worth from \$10,000 to \$50,000 each, made in the same way.

Calumet, of which the Calumet and Hecla is the center and by far the largest mine, has 40,000 people, and is divided for government purposes into two villages—Red Jacket and Laurium—and two townships—Calumet and Osceola. Calumet is the largest

BITUMEN MINE, SAN LUIS OBISPO COUNTY, CAL.—See page 177.

weights of gold per ton for tens of thousands of tons.
JOHN DWYER.

A GERMAN exchange notes that on account of the vibrations due to engines and other machinery the ordinary cement floor has not been found entirely durable. An advantageous composition is made of lime, sand, cement and clinkers, which should be used in thicknesses of at least 10 inches. The best mixture is said to be: Portland cement, 1 part; unslaked lime, 1 part; sand, 3 parts, and sifted clinkers, free from ashes, from 7 to 8 parts. For a top dressing of finer mass the composition should be 1 part cement, 3 parts sand and 2 parts of finely ground and sifted clinkers, the dressing to be well rammed and rolled after laying. Floors constructed in this way are said to be practically indestructible.

THE process by which wood is rendered non-flammable in the navy is intricate, but effective. The timber is first placed in a cylinder and a vacuum is formed. Steam is then admitted to the cylinder, which causes the moisture in the wood to vaporize. The products of the vapor are removed and the vacuum is re-established. At this stage of the work the saturating liquid—the consumption of which is a secret—is forced into the cylinder and the wood is thoroughly impregnated. After the wood has been dried, it is found that it is absolutely incapable of either supporting or conveying flame.

THE right hand, which is more sensitive to the touch than the left, is less sensitive than the latter to the effect of the heat and cold.

siz reports the following statement of assets and liabilities for the year ending April 30th, 1898:

| | |
|---|--------------------|
| Cash at mine office..... | \$172,968 |
| Cash at New York office..... | 15,000 |
| Cash at Boston office, exchange, copper at 84c. per lb., and mineral at 4c. per lb..... | 6,914,696 |
| Bills receivable at Boston and mine..... | 543,336 |
| Insurance fund..... | 205,651 |
| Total assets..... | \$7,851,651 |
| Drafts in transit..... | \$165,844 |
| Employees' aid fund..... | 14,261 |
| Bills payable at Boston and mine..... | 258,090 |
| Machinery contracts, coal docks, dredging and houses..... | 855,000 |
| | 1,293,194 |
| Balance of assets..... | \$6,558,456 |

The Calumet and Hecla owns mines, stamp mills, smelters, railroads, docks, steamer, water works, sawmill, farms, forests, a ship canal and cities built on its own land. Standing on its property are nearly thirty churches in which the Gospel is preached in English, French, German, Italian, Swedish, Norwegian, Finnish, Slavonian and other languages. Each of these churches the Calumet and Hecla has furnished a free site for, as well as ground for a parsonage, and has helped to build by a cash donation which has invariably been the greatest in amount of any received for the purpose. Twenty thousand persons are dependent directly upon this corporation for their bread and butter, earned by the more than 4000 workmen whose names are on the payrolls. The wages are the highest paid in the copper district. The sums paid for labor and the annual dividends are about equal. A report furnished the MINING AND SCIENTIFIC PRESS shows that there are 2462 shareholders, who divide among them \$4,000,000 annually—an average of \$1625 for each

town in the country without a city form of government.

The stamp mills are four miles from the mines, on the shores of Torch lake; the rock from the mines is hauled to the mills in cars over a standard gauge railroad, well ballasted, equipped and manned. The stamp mills are two in number, the Calumet and the Hecla, each having eleven steam stamps. The gold-bearing quartz is crushed by gravity stamps; the conglomerate carrying the copper is pulverized by ball stamps, where an 18-inch piston is propelled by steam at high pressure to strike blows which make the earth quiver for a quarter of a mile about the mills.

The process of extracting the copper from the rock is simple in principle. The rock, which has already passed through crushers at the shafts, is fed into hoppers which deliver it under the stamp. From the mortar box, where it is crushed by the steam stamp, the rock passes through jigs and vanners, where an ever-continuous gentle motion, assisted by innumerable sprays of water, separates the coarser particles of copper from the rock, the greater weight of the copper causing it to fall into receptacles calculated for its retention, while the water carries the lighter sand from the crushed rock to further siftings. This process of selection is carried on from one machine to another, under ever-present jets of water, until the very finest jets of copper have been saved and only the worthless sand remains from what was rock carrying 3 to 10 per cent copper when it entered the big bins on the top floor of the mill. Nearly 4000 tons of copper-bearing conglomerate rock are fed into these two mills daily, all of which must be crushed into sand. The waste from the

mills would bury the machines in twenty-four hours if it were not removed. The process of removal is simple, the only agents being wooden launders and plenty of running water. Small launders run from the side of each machine, carrying the sand in solution. As these runlets join the size of the launder grows, until as the streams emerge from the mills there are a dozen rushing torrents of brick-red water. These are carried to a big cistern, not far distant, where a wheel 100 feet in diameter turns, its big buckets on its inner periphery scooping up the water from the cistern and dumping it nearly 100 feet above into a wooden launder which is elevated high in the air on trestles, and which carries the rapidly running sand and water a quarter of a mile into the lake, where a reddish Niagara spouts unceasingly from the wooden trough during the working hours of the mill. At first the water which carried the sand ran into the lake, near which the mills were placed, but the lake was filled and it became necessary to resort to the elevation of the water by the big sand wheels, to secure the necessary fall to permit the water to sweep the sand freely along with it. Millions of tons of sand have been poured into the lake, and hundreds of acres of dry ground now appear where there were once from 10 to 50 feet of water.

Not the least noticeable thing about the Lake Linden works of the Calumet and Hecla is the pump which furnishes water for the twin mills. This is claimed to be "the greatest pump in the world" and is housed in a tall building by itself. It stands 30 feet in height, and at each stroke forces nearly 500 gallons of water to the top of the mills. It feeds from a cement cistern having free connection with the near-by lake, and every minute of the working day raises from 30,000 to 40,000 gallons of water, having a capacity of 60,000,000 gallons a day. Its nearest neighbor in capacity in America is the 24,000,000-gallon pump in the Philadelphia water works.

Dredges and Amalgamators.

There are three distinct types of dredges used in river, harbor and placer work, viz., the ladder, dipper and suction. The ladder, or chain-bucket type, is probably the oldest and was originally designed in Holland, where it has been extensively used in canal and harbor work. In later years it has been largely in use in New Zealand in placer mining, where the material to be handled is lighter than in most placer beds in the United States. This style of dredge has its advantages. It is usually constructed of lighter material than the dipper type, works rapidly and the first cost is generally lower than that of the latter, both of a given capacity. But when it comes to handling the heavier material generally encountered in river beds, banks and bars, it is doubtful whether the ladder or chain-bucket dredge can equal the dipper dredge in strength or thoroughness.

The dipper dredge, originally covered by the Osgood patents, long since expired, has been used in this country in harbor and canal work for fifty years and was a factor in the construction of the Suez canal and the great Chicago drainage canal. In fact, the heavy dredging work of the world has been done by the dipper dredge. The older makes of this dredge were able to dip up the material and deliver it only to a point at right angles with the car body; but a later pattern, covered by E. S. Bennett's patents, is so constructed as to swing the loaded dipper around and deliver the gravel on the rear of its own platform, then completing the circle before reloading. In this case the dipper is made to open and close automatically.

The suction dredge is so made as to produce a vacuum in a submerged pipe, as a result of which there is a violent rush of water, sand and gravel to the surface. This suction is capable of carrying up quite heavy material, but cannot loosen the gold particles which are often imbedded and cemented in the crevices. The capacity is ample in this style of dredge and its work is effective in sub-aqueous sand and silt. It has been in use to some extent in North Carolina, and one was built to operate near Elizabethtown, New Mexico.

Until recent years all types of dredges were operated by steam, but successful attempts have lately been made to operate them by electricity. In the economic use of steam on the dipper and ladder dredges, the advantage seems to have been with the former. S. Y. Schermerhorn of the American Dredging Co., Philadelphia, in December, '93, says: "Recent English experiments have demonstrated that ladder dredges consume 60% of engine power in moving buckets and engine without working load." This would tend to show a greater loss of power in operating the ladder dredge than the dipper, on account of the greater friction in running the buckets than in operating the dipper. By the application of electric power to either dredge, the mechanism is simplified and much friction eliminated, because a motor can be attached direct to the work to be performed. An electric power plant is being put in at Boise basin, Idaho, for the purpose of operating dredges of the ladder type.

The amalgamator feature of the gold-dredging plant is always an application of some form of device

for saving the gold by gravitation. Where mercury-filled riffles are used, it is still a matter of saving the gilt particles by gravity. But the application of this principle is often so interfered with that only a small percentage of the free gold is saved. In many cases all the lighter and finer particles are lost and ignored, and it is believed by good authorities that this very fine gold constitutes 90% of the gold values in alluvial deposits. Much of this is so fine that it is incapable of being saved in swift currents of water; but it is known to gravitate better in still water. In the saving some time ago made by a Colorado amalgamator 70% of the saving was of the flour gold, which would certainly have been lost by the usual gold-saving method. The world has been enriched by the saving of the 5% or 10%, constituting the coarse free gold in gravel beds, but when some device shall be so perfect as to allow the principle of gravitation to act perfectly, we shall appreciate the value of the 90% which was lost.

Denver, Colo., Aug. 4th, '98.

WASCOTT.

Should Not Be Removed.

TO THE EDITOR:—The removal of the State Mining Bureau from its present central location to the Ferry building is the most move of any State department in years. The State of California can be justly proud of its collection of minerals, embracing as it does the finest collection of its class in the world—the result of the enterprise and liberality of our earlier mineralogists, aided by liberal donations of miners and appropriations of the State to keep up and diffuse information and awaken interest in the leading industry of the State, which has made it what it is. No better location than the present one can be had—central, easy of access, near all the hotels. Every mining man or those interested, whether to consult authorities in the library or glean from the interior mining papers the weekly news, or by those who desire to inspect the valuable collection of minerals on exhibition, both students and curiosity seekers—all will go, while the ferry depot will not have one in ten visit it. Upon inquiry I find that the present quarters have 16,000 square feet as against less than 10,000 at the ferry, and while they are all light throughout, the proposed ones are on a dull day dark enough to require lights. The excuse offered for removal is that the rent will be only \$150 per month as against \$250. Well, which is the cheaper: to go where the usefulness of the institution will be destroyed or remain where it will benefit those for whom it is designed? The last Legislature endeavored to abolish the Bureau. Is this the preliminary stroke to enforce the same? It really looks to me as if every valuable State institution must be governed by politics or be crushed out, and this seems

to be one of them, as it affords too few places for incompetents. Thus, lack of appropriations finally takes out of the field work men who have and can gather the most valuable information and practical hints on mining, until now the annual report is nothing but a mass of statistics, dry and uninteresting, except as to those immediately concerned. The removal of any of our large commercial houses from the lower part of the city out to the park would be just about as reasonable, because they could secure a lower rent, although losing their trade, as the removal of the Mining Bureau will be for any benefits that will accrue to the miners.

San Francisco, August 15th, '98.

Good Mill Work at Pony, Montana.

TO THE EDITOR:—I send you herewith a copy of a weekly mill report that I find quite convenient for preserving a record of mill work. Attention is called to the amalgamation test. The gold here is in such fine particles that battery amalgamation was supposed to be the best for close saving. Inside plates were formerly used, but were removed; battery amalgamation was continued; the clean-ups showed no gold in the mortars. The loss of quicksilver was three pounds per 100 tons of ore crushed. Two weeks' test was then made as indicated. Two batteries run with quicksilver fed with the ore, and two with none inside, all being fed onto the lip and apron plates. The results were so favorable that outside amalgamation is used exclusively; the run on "lead ore"—ore carrying 9 per cent of concentrates of 50 per cent lead value, yielding \$3.75 per ton on the plates with a loss of one and a quarter pounds of quicksilver per 100 tons of ore. The screens are 30-mesh steel wire, with narrow, steel-lined mortars; 950-pound stamps, hammered steel shoes and dies, steel cams and tappets. An average of fifty tons per day is put through. The pulp passes over lip, apron, terrace and sluice plates and riffles, through two sets of hydrometric sizers to six Frue vanners—two 4-foot Morse belts and four 6-foot plain belt machines speeded to handle sized stuff. A 4-foot Pelton wheel under 160-foot head furnishes power for the stamps and Blake crushers, while a No. 3 motor runs the vanners. The mill, located two miles west of Pony, Mont., is conveniently arranged and substantially built, having a seven months' water season at this altitude, 6000 feet. The output of ore this season is partly oxidized, giving a lower percentage of saving than from the lowest level. The ore is quartz, mixed with porphyry, carrying about 4 per cent of iron, lead and copper sulphides. The mine now being worked—the Galena—is one of eleven patented claims and shows a ledge from 4 to 30 feet wide of milling ore. It is opened through two tunnels, the

E. L. BALLOU, Superintendent.

lower being 600 feet above and 800 feet distant from the mill. The lower tunnel opens the vein 250 feet below the surface, showing so far two main ore chimneys, one carrying a good percentage of lead, the other less lead with some copper. A gravity tramway delivers the ore to the mill at a cost of less than 5 cents per ton, the total cost of delivery and milling being under 60 cents per ton. This property belongs to the Garnet G. M. Co. of St. Louis, Mo.; F. C. Wood president, J. M. Durdy secretary, and C. H. Wood resident manager. The mine and mill give employment to thirty men.

E. L. BALLOU.

Pony, Montana, August 8th, '98.

Coast Industrial Notes.

—Pasadena, Cal., satisfactorily sprinkles its streets with petroleum.

—In a field fire at Pendleton, Oregon, 11,550 bushels of wheat were recently destroyed.

—Seventy-five carloads of sheep passed through Sacramento, Cal., last Monday for Chicago.

—Joseph Rising cut 140,000 shingles in ten hours at an Everett, Wash., shingle factory recently.

—The Los Angeles Express estimates this season's walnut crop of southern California at 4500 tons.

—Ninety carloads of fruit were shipped East last Saturday and Sunday from Sacramento, Cal.

—New Zealand favors the Pacific cable, and would adhere to the Pacific rather than the Cape route.

—Latest reports at Vancouver, B. C., are that the northern salmon pack amounts to 193,300 cases.

—Whittier, Cal., proposes to issue twenty-year bonds for \$40,000, to build municipal water works.

—At Huntington, Oregon, O. W. Porter last week sold 150,000 pounds of wool at 13 cents a pound.

—The Shasta Lumber Co. at Buena Vista, Cal., is outputting 120,000 feet of lumber daily and employing 300 men.

—At Heppner, Oregon, 425,000 pounds of wool were sold last week at prices ranging from 9½ to 13½ cents a pound.

—The Northern Pacific is pushing work on the Hoquiam extension and will have trains running to Hoquiam by Sept. 1st.

—The Lakeside ranch near Bakersfield, Cal., is said to have produced this year 50,000 sacks of barley and 45,000 of wheat.

—The extent of the drouth in California is indicated by the likelihood of the Truckee river going dry next month, an unheard of event.

—The Ogallala Cattle Company, Casper, Wyo., has sold its cattle, 20,000 head, to C. J. Hysham & Co. of Red Oak, Ia., at an average price of \$30 a head.

—Mackenzie & Mann, building the Columbia & Western extension into the Boundary country, B. C., have secured 1000 men in Boston; wages, \$2 per day.

—At Chino, Cal., the sugar factory has begun grinding beets. The crop on the Chino ranch amounts to 2800 acres. About 7000 tons are expected from Anaheim.

—The Quaker City National Bank of Philadelphia has brought suit against the city of Tacoma, Wash., for the payment of old city warrants aggregating \$100,000.

—San Diego, Cal., reports a good Eastern demand for lemons and at satisfactory prices, but the fruit is scarce in that section. Five carloads were shipped last week.

—The canal known as the Big Ditch in Hood River valley, Oregon, built for the benefit of fruit growers at a cost of \$28,000, was paid for out of this season's crop of berries.

—The Red Cross Society of San Diego, Cal., furnished a carload of lemons for the U. S. soldiers at Santiago. Miss H. M. Gould of New York paid the transportation charges.

—Pres. J. J. Hill of the Great Northern Railroad says that he will at once begin work on improvements in the northern part of Seattle, Wash., that will cost nearly a million dollars.

—At Sanger, Cal., the American Lead Pen-ll Co., a branch of the Hoboken, N. J., factory, uses five cords of redwood bolts per day. A carload of bolts is shipped to the Eastern factory every week.

—The U. S. Land Office at La Grande, Oregon, shows that in the district composed of Baker, Grant, Morrow, Umatilla, Union and Yallowa counties there is an area of 5,804,744 acres of unappropriated and unreserved lands.

—A fire at Fresno, Cal., last Saturday, destroyed property valued at nearly \$400,000. It rained packing plants of the Forsyth and henix companies, the Union and National Ice companies' warehouses and other buildings are consumed.

—The Oregon Railroad and Navigation Co. reports actual earnings: For June, gross, \$49,807; net, \$23,451; increase, \$70,351. For the year ended June 30th: Gross, \$6,895,393; net, \$2,941,973, an increase of \$1,043,088; surplus over all charges, \$663,955.

—J. Carroll has been appointed receiver of the Boston and Alaska Transportation Company of Seattle, Wash. In the application for receiver it is stated that the indebtedness of the company amounts to \$94,000. It is also stated there is due the company from the Ca-

Other accounts due amount to \$14,000. Among the assets of the company are the ocean steamers Brixham, Lareda and South Portland.

—The Canadian Dominion Customs Department reports that \$300,000 was collected in duties during the fiscal year just closed upon miners' outfits at the boundary line in the White and Chilkoot passes leading into the Yukon territory. The collections were chiefly made from Americans.

—In Oakland, Cal., the Southern Pacific Railroad Co. is credited with intention to substitute electricity for steam as a motive power on its entire local system. The change, it is said, will include the broad and narrow gauge Alameda locals, the Seventh street, Webster street and Berkeley locals and the San Pablo avenue cable system.

—Ten months ago work was shut down on the Alcatraz Co.'s asphalt mines, known as Rincon mines, near Santa Barbara, Cal., but work has resumed and will be extended as fast as conditions will allow. For five weeks men have been repairing the buildings and machinery and unwatering the mine, which is 200 feet deep. There are thirty men at work.

—In the book issued by the U. S. Government for 1897 it is shown that the flax fiber in the Puget Sound region equals the best products of Europe. Straw sent to Ireland for treatment by skilled labor produced scutched flax valued at \$350 a ton, and hatched flax worth \$300 a ton, with the use of only one and a half bushels of seed to the acre.

—The Chihuahua, Mexico, Enterprise says that an English corporation headed by W. A. Moffat, promoters of the Durango Western and Pacific railway, have in the Bank of London \$15,000,000 Mexican money, subscribed to build the road. Work will begin next month at Durango and Culiacan. The company has a subsidy from the Mexican Government of \$12,000 a kilometer for the mountain road and \$7000 a kilometer across the table land.

—The decision of the directors of the San Francisco Mechanics' Institute not to hold their annual exposition this year is an additional reason why manufacturers and merchants would do well to exhibit at the California State Fair, which begins at Sacramento Sept. 5th. Liberal inducements are made as to space and transportation, and Sec'y Smith should be at once consulted by those realizing the commercial value of such an exhibit before the people of the State.

—The recent fire at Susanville, Cal., destroyed the land office of the unfortunate town and all of the land records. This will make it necessary to furnish certified copies of all the records and plats and other data relating to the lands in the northeastern part of the State. Certified copies of the land entries will have to be obtained from Washington. U. S. Surveyor-General Gleaves believes that he will have to increase his force, and that it will take six months to finish the extra work caused by the destruction of the Susanville records.

—Pacific coast ports show a gain both in exports and imports. San Francisco exported in '98 3.34 per cent of the total exports of the country, against 3.08 per cent in '95, 2.79 per cent in '94, 3.96 per cent in '92, and 4.24 per cent in '90. Her percentage of the imports was in '98 6.98 per cent, in '97 4.50 per cent, in '95 4.95 per cent, and in '90 6.13 per cent. The Puget sound customs district galued materially in her share of the commerce of the country, her exports in '98 being 1.45 per cent of the total, against 1.13 per cent in '97, .78 per cent in '96, .55 per cent in '93, and .39 per cent in '90, while the imports of the year, although slightly less than those of '97, were much greater than those of any prior year.

—The Western Australian International Mining and Industrial Exhibition will begin at Coolgardie March 21st, '99. It is under the patronage of the Western Australian government and granted the privilege of free railage to the exhibition and free bond except where the exhibits are sold. The United States government will be asked to officially recognize the exhibition and to appoint official commissioners to represent this country at the exhibition. The exhibition presents an opportunity of pushing our products to the front, particularly to points on the Pacific ocean, destined to be the field of the great commercial contest looming up in the near future and in the direction of our newly acquired colonies in the Philippine islands.

—Pacific coast salmon packing is now far enough advanced to make estimates, which indicate a shortage of 900,000 cases, as follows:

| | |
|---------------------------------|---------|
| Shortage on Columbia river | 100,000 |
| Shortage on Fraser river, B. C. | 500,000 |
| Shortage on Puget sound | 250,000 |
| Shortage in other localities | 50,000 |
| Total | 900,000 |

With increasing consumption every year and the Government use of canned salmon as army rations, the matter of price is now in the hands of the Alaska Packers' Association, which has already advanced the price on its stock of red fish left over from '97 to \$1 per dozen f. o. b. Pacific coast. This is equivalent to about \$1.13 on the Atlantic coast. The association leaves the trade to draw its own inferences as to the opening price to be made on the new pack. The opening price last year was 90 cents per dozen for red fish.

—On July 7th, '98, the concession granted by the Government to the State of Coahuila in the year '95, for a railroad from Saltillo to a point on the Mexican International, was modified so that it now covers a road to be built from Saltillo to either Trevino or Paredon, on the Monterey & Gulf road. The State government is granted authority to organize one or more companies for the construction of the roads, surveys for which must commence within one year, while construction must

of the presidential decree. During the first year after commencement of construction not less than twenty kilometers must be built, forty kilometers every two years thereafter, and the whole line must be completed within seven years. After ninety-nine years the road is to become national property and must be free from all incumbrance.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING AUGUST 9, 1898.

608,746—TYPE AND HOLDER—J. F. Ames, Portland, Or.
608,747—TUMBLER OR JUG—L. Christiansen, Seattle, Or.

608,758—GATE OPENER—W. J. Moore, The Dalles, Or.
608,759—FORM PLATE BENDER—J. W. Osborne, San Jose, Cal.
608,760—MUSIC HOLDER—A. A. Patterson, Wilbur, Wash.
608,761—HAT SWEAT BAND—C. Stader, S. F.
608,762—FLOWER STEM CUTTER, Etc.—D. Tilden, Oakland, Cal.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

TYPE AND TYPE-HOLDER FOR BOX-PRINTING.—John F. Ames, Portland, Or. No. 608,746. Dated Aug. 9, 1898. This invention relates to the construction of movable type and a chase or holder therefor, by which they are adapted to be employed in conjunction with a cylinder upon which the holder is mounted, for the purpose of printing upon wooden boxes and like surfaces. The object of the invention is to provide hard-surfaced type, which are especially adapted for printing upon wooden surfaces and so forming the faces of these types that they will readily take the ink over the whole surface and correspondingly imprint it upon the surface to which they are afterwards applied. The type are made with convex printing faces and concave rear surfaces. The ends are beveled and the sides are converging radially, so that the type may be fitted from the rear into the channels in the holder, which channels are cut out with the same beveled or inclined sides and ends. When the type have been thus introduced, they are held in place by a concavo-convex plate which fits behind the type and into the rear face of the holder, which thus retains them in place, at the same time it is easily removable so that the type may be changed at pleasure.

FRUIT OR FLOWER STEM CUTTER AND HOLDING ARRANGEMENT.—Douglas Tilden, Oakland, Cal. No. 608,807. Dated Aug. 9, 1898. The object of this invention is to provide a convenient and effective means to grasp the stem of flowers or fruit, so as to prevent their falling while being gathered, and in such positions that it is not possible or convenient for the gatherer to use one hand to hold the article while the other is engaged in applying the shears to cut the stem. It frequently happens that the gatherer has to mount a ladder or other elevation to pick the fruit or flowers growing upon the wall of a house or trellis, and when so situated it is often impossible to use more than one hand for the work. The device as constructed consists of a pair of separable metal plates which are fixed to the shear blades and project outwardly therefrom, then extending approximately with the jaws of the shears, they return upon themselves and form resilient fingers, which are adapted to hold the article to be cut, so that when the device is closed the stem is first grasped by these fingers and the part passing through the blades of the shears is afterwards severed.

Recently Declared Mining Dividends.

Portland, Colorado, extra, 30 cents per share; payable immediately.

Sacramento, Utah, \$5000; payable Aug. 25.

South Swansea, Utah, \$7500; payable Aug. 25.

Bullion Beck, Utah, 10 cents per share, \$10,000; payable immediately.

Elkton, Colo., 2 cents per share, \$20,000; Aug. 20.

Victor, Colo., \$30,000 regular and \$70,000 special; payable Sept. 1.

Florence, Montana, 1 cent per share, \$25,000; payable immediately.

Anchorage-Leland, Colorado, 1 cent per share, \$1000; Aug. 15.

Empire State M. Co., Idaho, 10 cents per

Personal.

T. T. LANE, Supt. Lane mines, Ely, Nev., is in San Francisco.

J. M. LEAHY becomes Mgr. Montezuma mines, Ashcroft, Colo.

S. S. GANNETT of the U. S. Geological Service is in Baker City, Or.

W. MAITLAND, Supt. Nash mine, Abrams, Cal., is in San Francisco.

M. B. KERR becomes Gen. Mgr. Nashville G. M. Co., Nashville, Cal.

Wm. KNEALE has been reappointed Supt. Creole mine, Park City, Utah.

F. R. WEHE, mining attorney of Downieville, Cal., has returned home.

J. F. WERN of the Pocahontas mine, Placerville, Cal., is in San Francisco.

B. F. HARTLEY, Supt. Zentgraf mine, Newcastle, Cal., is in San Francisco.

J. WEISSREIN, Mgr. W. Y. O. D. mine, Grass Valley, Cal., is in San Francisco.

J. W. BOUSE is appointed Supt. Twin Springs M. Co., Idaho City, Idaho.

F. S. ROUMAGE has resigned as Supt. Horse-shoe Bar mine, Michigan Bluff, Cal.

D. FRICOT of Grass Valley is visiting his mining properties at San Antonio, Cal.

Wm. MEYERS, a mine owner, Placerville, Cal., has returned from San Francisco.

A. H. TICKELL, part owner Phoenix mine, Nevada City, Cal., is in San Francisco.

D. KEITH, Mgr. Silver King mine, Park City, Utah, is at Yellowstone Park, Wyo.

G. A. FREEMAN, Mgr. Templeton mine, Silverton, Colo., has returned from Buffalo, N. Y.

C. B. WINGATE, managing owner Chloride-Bailley mine, Dedrick, Cal., is in San Francisco.

W. L. MONTGOMERY, Supt. Utica mines, Angels, Cal., has returned from San Francisco.

C. WATERHOUSE, owner Big Dipper mine, Iowa Hill, Cal., has returned from San Francisco.

J. J. DALY of the Daly mine, at Park City, Utah, is visiting his Daly mine at Bullion, Idaho.

F. W. PAGE, Gen. Mgr. South Fork gravel mines, Forest, Cal., has returned from San Francisco.

J. C. DIAMOND, managing owner Limpensel mine, Placerville, Cal., has returned from San Francisco.

LEO VON ROSENBERG has returned to San Francisco from a professional visit to Riverside Co., Cal.

J. BAMBERGER, part owner of the Bellevue mine at Baker City, Oregon, has returned to Salt Lake City, Utah.

A. J. BETTLES, Supt. Highland Boy mine, Blugham, Utah, is examining mining properties in British Columbia.

DR. HAINES of Harvard University and G. W. Pelton of Boston are examining placer grounds in Itasca Co., Minn.

J. A. VANCE, Supt. Starlight mine, El Dorado, Cal., has returned from his bridal trip through southern California.

GEO. E. PRICE has left Helena, Mont., to take a position with a French mining company operating in northern Africa.

E. W. CHAPMAN, managing owner Gold Note and Philadelphia mines, Omo Ranch, Cal., has returned from San Francisco.

EDWARD L. BRAYTON of the Pelton Water Wheel Co. has returned from a three months' trip to New York and abroad.

WALDEMAR LINDGREN of the U. S. Geological Survey is in Hailey, Idaho, to examine the rock structure of Wood river.

W. S. BROWN, Mgr. North Mountain M. Co., Cherry Creek, Nevada, left Salt Lake City, Utah, to spend two weeks at the mine.

C. A. ARMSTRONG, part owner Batchelor mine, Ouray, Colo., is at Mercur, Utah, to arrive at a plan for starting the mill of La Cigale mine, in which he is a principal stockholder.

R. H. MCKEE of the U. S. Geological Survey Corps, Washington, D. C., and ten men have reached Baker City, Or. Their present territory comprises 9000 square miles, of which Baker City is the center.

G. BAYHA, representing Cologne, Dusseldorf, and Berlin, Germany, capitalists, and who for five months has had men employed in the development of copper properties near Redding, Cal., is in San Francisco, en route home, to consult with his people on plans for the erection of a smelter of 500 to 1000 tons daily capacity. Mr. Bayha expects to return to California within three months.

That Prehistoric Skull.

TO THE EDITOR:—In the days of '49 there lived at Angels a merchant named J. C. Scribner, generally called "Scrib," at Murphys a doctor, Wm. Jones. "Scrib" was famous as a "josh." Nothing delighted him more than to get hold of a tenderfoot and fill him up with an impossible yarn and have the tenderfoot repeat it. Many of Bret Harte's best things were of "Scrib's" inventing. Placer miners ground-slued out the skull of some forgotten miner from a piece of ground near Angels on what was then known as Washington Flat. This was not an unusual event, as two skeletons were sluiced out in the same way at Murphys at about the same time. The skull from Washington Flat was taken to a carpenter's shop; it lay around there for some time and was finally kicked out and into an old shaft back of the shop. Some time afterward the shaft was cleaned out by Jimmie Mattesson and the skull found. Its past history was well known. The shaft was not 100 feet deep; no shafts in that section were.

The skull was given to "Scrib," who at once saw the material for a good josh in it and soon gave it a history. Dr. Jones was numbered as one of his victims. The doctor was so impressed with the importance of the find that he called Prof. Whitney's attention to it when he was exploring the county. Whitney at once took the matter up and forwarded the skull East. The joke had now grown to such proportions that "Scrib" feared to have the truth known and "stuck to his nut-ton" at all times. Bret Harte was evidently let into the josh, as he writes of it as the skull of some old Missourian that came across the plains. The county was fathered with the josh by being called Calaveras, or "skull." With these facts before the reader, the following, just published by the Peabody Museum of American Archaeology, forms most amusing reading:

"The Calaveras Skull.—The recent gift to the Peabody Museum of American Archaeology and Ethnology of the famous 'Calaveras skull' reawakens interest in the remarkable relic of antique man. The skull was found in 1866 imbedded in gold-bearing gravel in Calaveras county, Cal., at a depth of 127 feet. Above it were four beds of lava that had flowed from a now extinct volcanic vent. The late Prof. J. D. Whitney (whose sister made the gift to the museum) was convinced of the genuineness of the discovery. The owner of the skull is supposed to have lived in the Pliocene epoch—a period so remote that the most ancient dates of history seem quite recent in comparison."

And all the while "He came from old Missouri—yes, all the way from Pike,"
E. H. SCHAEFFLE.

Murphys, Cal., Aug. 9th, '98.

THE repair ship Vulcan, recently described herein, was one of the naval successes of the late war. That she has fulfilled the promise of her originator is shown by the fact that for further service our ships are not coming home except to be docked. The great fleet of Sampson lies in the land-locked Cuban harbor, with the Vulcan close at hand, prepared in every essential way for the duty which the Navy Department may prescribe, and this after many of these vessels have been months away from a northern machine shop and nearly a year from a dock yard. The character of the work now being done by the repair ship is shown to some extent in a letter from one of her officers who, writing from Guantanamo bay, says, in regard to this vessel and its utility: "I can only say that we are busy night and day. Our brass furnace is going every day, there being unexpected calls for brass castings of all kinds and sizes. It seemed that every vessel in the fleet—colliers, transports, supply and warships—has either a winch, a blower engine or a dynamo broken down. New eccentric straps and rods galore are required, with brasses, gun castings, etc. We have supplied also an enormous quantity of stores to the different ships. We are

busy all the time, and there is no vessel in the fleet but has had something done to it."

New Carbon Dioxide Engine.

At a recent meeting of the Franklin Institute, Philadelphia, the operations of a new carbon dioxide engine were explained by Wm. F. Roberts. This engine is actuated by carbon dioxides, used expansively upon the piston of the engine in a manner similar to that employed in steam engines, but with the piston area reduced proportionately to the amount of power, as compared with steam. The speaker exhibited two engines, one horizontal and the other vertical, each supplied with 2x2-inch cylinders, and each capable of developing 25 H. P. The carbon dioxide gas for use in the engine is stored in liquid form in a cylinder prepared for the purpose. From this it is led in small tubes through a heating apparatus, where it is brought to a temperature of about 150° to 200° F., at which temperature it is introduced into the engine. By means of a unique system of valves, the gas at this high temperature and pressure is passed into the cylinders of the engine and then withdrawn from the engine at a temperature below 32° F. In this way, the speaker said, the gas is made simply a vehicle for carrying heat energy to the engine by means of which it is transformed into energy in such a form that it can be readily utilized as power. The gas in a liquid form is relatively cheap, it being possible to secure it for \$3 per ton, while some firms agree to furnish it as low as \$1 per ton. The gas is a waste product in many lines of manufacturing, and it is said to be less expensive to liquefy it than it is for manufacturers to rid themselves of it in many plants where it is produced in the process of manufacturing other products. It is claimed for the carbon dioxide engine that, being compact, powerful, and economical of operation, it can be adopted with success in many places where steam and electricity are now used.

Points in Annealing Steel.

Prof. H. E. Smith, in a paper before the Engineers' Club of Minneapolis, calls attention to several points on the working of steel that are of interest:

"In cases of special forgings, as in the heads of eye bars, it would seem to be wise to anneal the end, so as to remove the stresses which must exist between the unheated part and the part that was heated and forged. In the manufacture of wire frequent annealing is rendered imperative by the internal stresses and hardening effect caused by the working of the wire in the die plates. The usual method of annealing is to heat the piece, after it has cooled, to the full red or to a medium orange color, and to allow the piece to cool slowly and uniformly."

"On account of the tendency of steel to crystallize above the full red heat, and also while the temperature is falling to the dark red, the proper heat for annealing is the full red, followed by quickly cooling to the dark red and then slowly cooling through the remaining range of temperature. Cherrioff gives the following as the result from three samples cut from the same bar of steel. After equally forging, the samples were treated as follows: A was slowly cooled. B was reheated to a full red and then slowly cooled. C was reheated to a full red, quenched to a dark red, and then slowly cooled. A broke under a single hammer blow. B required five such blows. C could only be broken by a blow of a five-ton steam hammer."

"Rapid cooling produces hardness in steel, and the more rapid the cooling the greater is the effect. There seems to be an apparent exception to this rule in the so-called 'water annealing' practiced by some forge men when doing a rush job. They heat the piece uniformly up to the point where it will just show red in a darkened place, and then quench it. By this means the hardening effect due to

forging is only in part removed, in that the hardening effect of sudden cooling from this temperature is less than the softening effect after forging by the reheating. The piece is by no means in as good condition as it would have been had the usual method been applied to it. It will also be found, on applying tests for hardness to the pieces of our experimental bar, that, beyond the point where the crystalline structure changes suddenly, the steel has become extremely hard, and especially very brittle toward the end that was exposed to the highest heat."

A Unique Railroad in Oregon.

Near Bridal Veil, Oregon, is a railroad over which passes an enormous traffic although the line does not possess a single car. It is upon one of the highest elevations of the west slope of the Cascade mountains, in the heart of what has been until recently an almost inaccessible region. Its length is five miles, and it circles and twists until it resembles the trail of a mammoth serpent. It represents the most difficult achievement of the lumbermen of Oregon. The only feature of the road except the line itself that resembles the ordinary narrow gauge railroad, is the eighteen-ton locomotive. The freight is logs which average a size equal to that of the engine boiler. The logs are felled by the lumbermen in the employ of the Bridal Veil Lumber Company. They are rolled to the nearest point on the railroad, then arranged in a line with huge staples, forming a train of logs. The foremost is chained to the engine which hauls it and its companions upon the roadbed of the line. The railroad is narrow gauge, 3 feet, constructed on the same principle adopted by the regulation roads over which cars pass, with one exception. Stout plank is nailed to the ties and upon this foundation the logs rest as the engine pulls them along. The rails act as guards to prevent the logs leaving the track. In this manner, the timber is conveyed from the point at which the engine takes it in charge to the beginning of a two mile flume that leads from the end of the first section of the road to the chute pond near the mill where the logs are turned into lumber.

That the logs may slip easily along the roadbed, the plank nailed to the ties is kept greased except at sharp grades, where the momentum of the logs is sufficient to cause them to slide easily. As the road is on a mountain side, where the grade is often so great as to make straight descent of the line impossible for the reason that if they were tried, the logs would slide forward on the engine, the road has been constructed largely on the plan of that by which the tourist ascends Pike's Peak in Colorado. The curves are in many instances so abrupt that it seems as if the logs must slide over the rails to the ground, but disaster of this sort is avoided by the logs being chained together. Fastening them in this style gives the timber train that same general solidity which the vestibule imparts to a train of passenger cars.

The roadbed, or rather its foundation, is not of course like that of the great lines over which passenger and freight cars roll, but although roughly constructed it has surprising strength.

When the flume is reached, the engine is detached from the log train and the logs from which all chains are removed are diverted into the mouth of the flume. Once started, it takes but a small fraction of time to make its way to the lower pond. Here the process of forming the big tree trunks into trains is repeated in the same fashion as at the upper pond. The process of getting them on the track, however, is much easier. At this point the track runs in such a way that logs and road are almost side by side, so the engine has little difficulty in transferring the freight from the water to the roadbed. The logs now begin the conclusion of their journey, for from the lower pond the line or road runs without a break to the mill, where the logs are turned over to the sawyers.

After the process of turning the felled trees into boards is complete, the

lumber is shot into a flume like the one previously referred to, which leads from the sawmill to the planing mill two miles below. It is claimed by the lumber company that nowhere else is a log felled, transported and converted into lumber in so short a space of time, considering the distance from the point where the tree grew to the planing mill where the log reappears in the guise of finished lumber.
